To: Lynnwood Link DEIS
Subject: Draft EIS coments

To whom it may concern:

I-351-001 I live on 148th street across from the proposed parking garage. As it stands at this point our property will not be taken. I have concerns about my ease of access to my home on this dead end street during and after construction. It s my understanding that there will not be a traffic light to regulate traffic in and out of the garage with both the entry and exit on my street. I understand Seattle is doing all this without parking garages. If "no garages" is going to work for Seattle why not Shoreline? If we are beating a dead horse on this, I feel the less of evils is alternative #2 as proposed.

I-351-002 Another concern I have during the construction phase is the hours of operation. Will the construction noise levels be lowered during the overnight hours? And if so, to what degree?

Jerry & Carol Rice
330 NE 148th St.
Shoreline, WA 98155
206-364-7342

1

I-351-001

Please see the Final EIS Appendix F, Conceptual Plans, for specific details on the NE 145th Street Station. The ingress and egress to the parking garage will not be located on NE 148th Street.

Station parking facility sizing balances the need for parking supply with other good multi-modal connections in order to serve the needs of the region as well as local communities. Sound Transit promotes multi-modal access to their stations by including pedestrian and bicycle facilities, including bicycle parking, and by integrating bus and paratransit.

I-351-002

For construction, the local construction noise ordinance will be applicable, and Sound Transit is committed to maintaining construction noise levels within the criteria. Sound Transit would work with residents and businesses to minimize construction noise impacts.

For nighttime construction, some aspects of which could be needed due to the heavy volumes of traffic on I-5 and other arterial roads, a noise variance would be required from each of the cities where construction would be performed. During that time, Sound Transit will work with the local jurisdiction to arrive at construction specifications that minimize construction-related impacts to nearby communities. However, this would likely affect trucking or hauling activities, rather than the on-site work needed to build a garage or the station.

Sound Transit DEIS Comment:

I-352-001

I support locating Shoreline's southern Sound Transit station at the 145th street site. I prefer this location because fewer homeowners will be negatively affected there than would be at the 155th option. This is because the Jackson Park Golf Course and Lakeside School would be on the southern side of the station, not family homes. Neither the golf course nor the school would be negatively affected by that station. I am sure almost all people who bought homes in Shoreline did so because they like it as is and want to keep it that way, not to be bought out by developers or live in a high density congested area surrounded by apartment houses. For the common good Sound Transit should take those homeowners into consideration, and doing so would not negatively affect Sound Transit. For Sound Transit to succeed, the bulk of your riders will come from the entire region, not from the removal of single family homes and densification of small areas around your stations. I do not believe you will gain significantly more riders by choosing the 155th St. location over the one at 145th St. In addition, it should be much cheaper for Sound Transit and all government agencies to upgrade the infrastructure around the 145th St. exit, which is what most of your riders will use to access your station.

Again, I support locating the station at 145th street. Thank you.

Tom Poitras

Subject: DEIS comment

Dear Sirs,
Please accept this email as a comment on the Lynnwood Link Extension project.
Name: Darcy Niedermeyer
Mailing address: 13330 3rd AVe NE, Seattle, WA 98125
Property address: 147 NE 116th St, Seattle, WA 98125

This property is on the east side of 15, next to the 117th St overpass as it becomes 1st Ave NE.

I-353-001 This comment is concerning Segment A, Northgate to Shoreline. There are 6 Alternatives to consider. Here are my opinions as they relate to the property at 147 NE 116th st, and the livability of that home.

A1 keeps the light rail away from the home and away from the nieghborhood. It also preserves more homes in the neighborhood, with out having to purchase and relocate many local residents. This option keeps the rail the furthest possible from the neighborhood. With a planting buffer, this keeps this small neighborhood livable. This is my preferred option.

A3 (A7 & 11) & A5 (A10) both have the rail line running on my property line, with no buffer. This puts the rail 12' from the bedrooms of the home. This would be a major impact on the quality of life for living in this home. With the light rail running 20 hr a day, this will impact the people occupying the home for the next 50 years. It will also diminish the value of the property for resale, with no compensation from Sound Transit.

Thank you for your time in considering this comment.
Darcy Niedermeyer

I-353-001

Your preference for Alternative A1 is noted. The Preferred Alternative for this project includes Alternative A1 with modifications. The Preferred Alternative at your location would have a wall between the tracks and residences. See Figure G-13 in Appendix G of the Final EIS for an example.

Subject: Draft EIS Commment re: Seattle Latvian Community Center & Church

I-354-001

The Latvian Community Center and Church play a vital role in keeping the Latvian language and culture alive. Saturday School is well attended by students up to the 12th grade. The students learn the language, customs, songs etc.. We have an annual garage sale which, in addition to being a fundraiser, brings neighbors from far and near to purchase many Latvian baked goods. And buy high quality garage sale items. The majority of the attendees are repeat customers. Our Christmas Bazaar also brings repeat customers, some from as far away as Whidbey Island, Tacoma and Portland. This event offers the opportunity for the Saturday School parents to raise funds to keep the school viable. Also, the customers may purchase hand-made goods, jewelry and baked goods. Thus bringing our culture to many people.

Our dance troupe utilizes the Center for practicing, as well as performing. They raise funds through their performances so they can represent the Seattle Latvian Community at Latvian Song/Dance Festivals in North America and abroad.

The Center hosts a fund raiser to support the Baltic Studies program at the University of Washington. The program includes Latvian, Estonian and Lithuanian studies.

The Church services are well attended and have an English language service once a month. Thus not excluding those who do not speak Latvian. They also have Sunday School for youngsters and Bible study sessions.

Our Center is not only for Latvian events, but is open for Estonian and Lithuanian events such as their independence day celebrations. They also participate in events hosted by the Latvian Community.

The current site has been home for many years after being displace from the Wallingford location in 1969. It would be a major financial impact to our community if we need to start all over again. Also, many of our population are elderly. A move may affect their ability to get to an unfamiliar location. The caretaker and her family live in a house on the property, the proposed change will disrupt an entire family.

There are many negative impacts to the Latvian Community if the Sound Transit proposal is approved. Please take these in to serious consideration before making a decision.

Thank you

Dagnija Valdmanis Johnson

1

I-354-001

Your comments about the importance of the Latvian Church and community center to you is acknowledged. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

To: Sound Transit Board Members
Re: Lynnwood Link Ext. Preferred Alternatives

Here is my wish-list for the 185th St. station and remarks for the preferred alternative south of the station. I grew up in Shoreline and live ½ mile (20 min walk) from proposed station. I drive through all proposed station areas on a daily basis.

I-355-001

185th St. Station Option #1

- At Grade
- Parking Garage on West Side with good lighting and emergency call stations
  - (Much less of an eyesore and more conducive to community development on east side)
- Covered walkways from garage crossing 1-5
- Pedestrian safety for crossing 185th from South side of 5th must be considered. Is it possible to have a station entrance on South side of o185th?
- Also Kiss-n-ride as conceptualized seems to be in poor proximity to intersection for merging
- Prefer design details reflective of natural environment as opposed to any one ethnic group, with exception of Northwest Native American
- It is hoped that when 5th avenue is re-aligned that mature trees to the east can be preserved as our mature trees define our area.
- Station design to promote ability to have community open space as this is currently a walking community and we anticipate further transit oriented development
- Bike lockers and water fountains.

If 145th station is chosen I advocate for OPTION 1. I am highly concerned re: bus pedestrian, and general traffic surrounding this intersection. The North placed parking garage seems to be a safer option so that garage and bus turn around entrances and exits be off 148th st. rather than directly on/off of 5th avenue. In the second option you have the garage exiting where the lineup to the northbound on ramp is making Left turns impossible from the garage. However, even with Option 1 I think more can be done for making more room for busses to have a loop on the first floor of the parking garage that is a separate entrance from cars etc. So travelers coming from East, West and South of 145th do not have to cross highly busy streets. It will likely be safer for the 1-5 Northbound ramp traffic. Also the Kiss-n-ride/paratransit area right on 5th seems like a difficult place to merge. Covered Pedestrian walkways in plaza area to S. of garage, maybe translucent of some sort, would be desirable in our climate.

I-355-002

I notice most of the board members live on the East side and that you will have a video tour of the proposed station areas, but have found in my own consideration of optimal station areas it is helpful to walk/drive around the proposed station areas to get more of a feel. For instance if your goal is to increase pedestrian ridership there are more

I-355-001

Your desired improvements for the NE 185th Street Station are noted. Many of the items listed are included in the current design such as, at-grade, parking garage on the west side of I-5 and bicycle parking. See Appendix F for the current design of this station.

I-355-002

Your comments about to the proposed light rail transit stations at NE 130th, NE 145th, and NE 155th Streets are noted. Your preference for the NE 145th Street Station Option 1 is noted. The station design at NE 145th Street for the Preferred Alternative has been revised since the Draft EIS; see Appendix F of the Final EIS for the current design.

The current design has the entrance/exit for the parking garage on 5th Avenue NE, not NE 148th Street. Also, the kiss and ride area is not located right off of 5th Avenue NE.

As your comment suggests, there are trade-offs and pros and cons at each of these locations. Station analysis indicates that ridership will be similar regardless of the station locations; see Section 3.2.2 of the Final EIS.

I-355-002 homes within a 15 min. walking radius (I walked it!) around the 155th st. station vs the 145th St. station. Diverting increased bus traffic to 155th may be better than the already clogged 145th area. Driving on 5th Avenue near 145th will give you a better sense of traffic. I don't envy the decision you have to make re: 145th vs 130th and/or 155th st. stations. I would say that 130th provides easier access for more low income homes concentrated in that area and connects the Lake City and Bitter Lake areas to lightrail, but your materials seem to suggest that people in those areas would take the bus south to the Northgate station.

Thank you for you enormously detailed DEIS. I look forward to participating further as station design progresses.

Sincerely,

Renee L Laigo

To: Lynnwood Link DEIS
Subject: Sound Transit Link Light Rail system impacting the Seattle Latvian Church and Center at 11710 3rd Ave N.E, Seattle, WA 98125

I am writing to voice concern over the proposed plans for the Lynnwood Link Extension of the Sound Transit Link Light Rail system, specifically as it pertains to the Latvian Church and Community Center.

I-356-001

I have been a long time user of Sound Transit and always support the growth and expansion of mass transit. While I believe the extension of the Light Rail system would be a valuable asset to the greater Puget Sound region, I urge the board to carefully consider the impact on the local community in drafting the proposed line.

As a member of the Latvian community, I primarily use the Latvian center for dance practices, fundraisers, and performances with the folk dance group Trejdeksnitis. Our group is very active in the larger community, regularly performing at Folk Life, Yule Fest, and the Seattle Public Library's "Baltic Rites of Spring" program. Through the support of the local community, our group has been able to travel all over the United States as well as to Latvia to participate in the UNESCO recognized Latvian Song and Dance Festival, as recently as this summer. I take great pride in being a member of this group as we are widely recognized as being one of the top dance troupes outside of Latvia.

Having the ability to participate in this group through the use of the Latvian Center has been essential in keeping me connected to the larger Latvian Community. Sometimes multiple times a week I find myself commuting to Seattle from my home in Tacoma to participate not only in dance activities, but also to attend or volunteer at special events or fundraisers, including our yearly Christmas Bazaar and Spring Rummage Sale. The Latvian center hosts many events such as this that are enjoyed and celebrated not only by the Latvian community all over the Northwest, but also by the larger Seattle community.

I am also a graduate of the University of Washington's Baltic Studies program. The use of the Latvian community center is vital to my undergraduate program. It provides a host for many important lectures, visiting speakers, and events, including hosting the Latvian President this upcoming Sunday. As the local Estonian and Lithuanian communities have no cultural centers of their own, they have built a strong relationship with the Latvian community and have shared use of our facility since its inception. The Latvian Church and Community Center is an irreplaceable home base for all members of the Baltic community to connect, as well as a place for the Seattle community to celebrate three often overlooked cultures and heritages.

The loss of home is not a foreign concept for the Baltic community, considering that our local community was founded by members who were forced to flee their homeland and settle in the Seattle area in exile. The preservation of our heritage is of utmost importance to this community,

1

I-356-001

Thank you for your personal comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you, the region's Latvian community, and the larger Baltic community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-356-001 and the Latvian Church and Community Center has been an essential part of that preservation. I urge the Sound Transit board members, engineers and planning committees to find a solution that does not once again force us to lose what we've worked so hard to build and maintain.

Thank you,

Tija Iles

Re: Sound Transit Link Light Rail system impacting the Seattle Latvian Church and Center at 11710 3rd Ave N.E, Seattle, WA 98125

Dear Ms. Swift,

I-357-001 I wish to add my voice to the many concerns you must have received over the proposed plans for the Lynnwood Link Extension of the Sound Transit Link Light Rail system, along the east side of I-5, with potential devastating effect on the Baltic community in Seattle and beyond.

I was born and raised in a Latvian family in Seattle. A huge part of my childhood and youth were spent at the Latvian center, where there was always something going on: Latvian school on Saturdays, church on Sundays, folk dancing, choir, crafts groups and so on. I remember pitching in as a teenager on volunteer weekends to help build the church and center. Next to me were other teenagers, pensioners, people from all over the Northwest. One big family doing their best to build a home for future generations to be able to preserve and honor their heritage.

As it happens, I have now lived most of my life in Europe, away from Seattle -- but not really ever away from the Latvian center at 11710 3rd Ave N.E. Over the years, I have always managed to return there for family events -- weddings, milestones, and funerals. I celebrated my own marriage there and attended the funerals of both of my parents. In short, I could not begin to imagine my family's life without the Latvian church and community center, which are now under such grave threat. To me and to many others these are not just buildings on a piece of land. This is a major part of us.

Surely there must be a way to develop modern transportation networks without crippling a community that brings a cultural richness to the diverse mosaic that is the strength of Seattle and, indeed, the USA. Please consider these very human factors as you continue to evaluate the impact of the proposed plan. Thank you.

Sincerely,

Erik Rusis

London

To: Lynnwood Link DEIS
Subject: comment on DEIS

I-358-001 I am opposed to parking structures at proposed stations on 145th and 155th in Shoreline.

Light rail through Shoreline is suppose to curb automobile use. However, any parking lot invites automobile use. By building a parking structure, you are encouraging commuters to drive through the surrounding neighborhoods of the station to get to the station. To make light rail more environmentally friendly, you should instead be promoting walking, biking or taking the bus to the station, not driving a car. Moreover, a parking structure would blight the neighborhood of the light rail station. Who wants to live near a parking structure?

As I understand it, there is a city ordinance in Seattle that prohibits creation of new parking lots. Shoreline has no such ordinance. Given the proximity of the proposed stations to Seattle, a parking structure would attract a significant number of Seattle commuters. There is something unfair about this and the impact will be borne entirely on the Shoreline neighborhoods surrounding the new station, whether that is on 145th or 155th.

Yoshiko Saheki
2349 N 147th
Shoreline, WA 98133

I-358-001

Station parking facility sizing balances the need for parking supply with other good multi-modal connections in order to serve the needs of the region as well as local communities. Sound Transit promotes multi-modal access to their stations by including pedestrian and bicycle facilities, including bicycle parking, and by integrating bus and paratransit.

Hello,

I-359-001 I am a resident of the olympic hills neighborhood of seattle, and I am very excited about light rail coming here to the north end! I urge you to complete this project as soon as possible so that we can decrease congestion on I-5 and make our city cleaner and more walkable. To that end, I would advocate for a stop at 130th St and Roosevelt Way, which is a large, walkable intersection served by the 41 bus and near high density housing and some retail.

So I would like to see option A5, A7, A10 or A11 implemented.

Thank you.
Sincerely,
Julia Sandler

To: Lynnwood Link DEIS
Subject: Lynnwood Link DEIS comments

Hello:

I-360-001

Aside from my complete disagreement with the choice to site the Lynnwood Link alignment in the same right of way as I-5 (I'm guessing the potential cost of land acquisition was the determining factor - kind of short-sighted when considering this is intended to be a regional rapid transit system to last a century), which serves a market already served by I-5 instead of serving a new market and/or creating a new market via development, I have only one bone to pick with the design. I listened to the entirety of the "tech talk" on the 13th and I still can't figure out why the potential for development in surrounding station areas has not been maximized. The immediate station areas are slated to include a parking garage and not much else. Parking lots are not inherently bad. However, rail transit has a unique ability to move large amounts of people in and out of an area without the negative impacts automobiles bring. The impacts include but are not limited to constant noise, pedestrian safety concerns and the large allocation of space required to store and move automobiles which has no alternate use. These aspects negatively impact the environment that pedestrians find safe and comforting. To create the sustainable, dense and walkable nodes that rail transit enables it is imperative that the station area be as welcoming to pedestrians as possible. Every single rapid transit rail station is an opportunity to flip the paradigm that rules in the suburban Puget Sound - where the basic unit of design can again be the pedestrian instead of the car.

With the given alignment choice it will already be an uphill battle to get dense, pedestrian-oriented development in the immediate station area but that doesn't mean there shouldn't be a push for it. How about consolidating the park and rides and placing them at just a few locations? Make them larger and site them at the stations that have the least potential for non-automobile-oriented development. Depending on the aim of the park and ride (to take motorists off of I-5 as they approach the station and take the train into the city or divert motorists that normally travel to I-5 via surface streets and then into the city)

I-360-002

I was shocked when during the meeting the question was asked if there was a "preferred alternative" among the board and the answer was no. As a planning and capital project agency ST should have a pretty clear idea of what the "best" system looks like and have rational reasoning to back it up instead of fearing public backlash for having such a position. Public input should be an important part of planning for establishing what is valuable but planners and engineers are brought in to think in a broader sense, both spacial and temporal. Leaving such decisions up to the public is slightly reckless. I would like to see a preferred option and then a discussion about that.

I-360-003

This wasn't supposed to turn into rhetoric-spewing, a sermon or a lecture. It's just frustrating to see great opportunity squandered while taxpayers pay a premium for it. Should this extension of Link prove to be nothing more than train stations and parking lots to access them I am afraid the project will accomplish little more than adding a few lanes to Interstate 5. What is currently being planned

I-360-001

Please see Chapter 2, Sections 2.6.1 and 2.6.2, for a discussion of the environmental, transportation, land use, and other factors that led to alternatives along I-5. As Section 4.1 of the EIS explains, using I-5 right-of-way reduces the amount of private property acquisitions.

Station parking facility sizing balances the need for parking supply with other good multi-modal connections in order to serve the needs of the region as well as local communities. Sound Transit promotes multi-modal access to their stations by including pedestrian and bicycle facilities, including bicycle parking, and by integrating bus and paratransit.

Sound Transit's transit-oriented development policies support such development around its stations, with Sound Transit working in partnership with local jurisdictions and potential developers. However, local jurisdictions control the land use decisions that ultimately determine what kinds of development can occur.

I-360-002

Agencies often do not have a Preferred Alternative identified during the Draft EIS evaluation stage because the Draft EIS is the first time all the potential impacts of a project are presented to the public and decision makers. The Preferred Alternative is identified in the Final EIS.

I-360-003

Your comments about the Lynnwood Link Extension are noted. Chapter 6 of the Draft EIS provides an overview of the public outreach activities and methods for this project.

I-360-003 will constitute a commuter railroad that sees limited use outside of peak hours. I understand that ST has to look out for many interest groups but the future of our region should have immense weight when considering the design details of a project that will not be fully-realized for 10 years and will have an indelible affect on the spacial composition of our region for decades afterward.

Last but not least, thank you! Keeping a pulse on public sentiment around a large project is no small task and I can't even begin to fully appreciate all of the measures taken to make sure as much of the public is engaged as possible. I am curious about all of the different ways you field public input and how you weight it and how it shapes a project. Is there any more detail you can provide about the process than what is on the web site?

Thank you so much!

--

Save The Seattle Latvian Center

I-361-001 I was born in Milwaukee, Wisconsin to Latvian and American parents. My parents were instrumental in my developing a keen interest in my family heritage, both American and Latvian.

I am a proud US citizen. I am also proud of my Latvian heritage.

I moved to Seattle in 1978, when I was 21 years old and discovered the Seattle Latvian Center and Church in the early 1980's when I started attending the annual Christmas Bazaar (held each year in early November). It satisfied my hunger for the taste of the foods and the sound of the Latvian language of my Latvian mother and her parents.

I joined the Seattle Latvian Folk Dance Group Trejdeksnitis (tray-decks-neet-iss), in 2002 and have been a member ever since. We rehearse in the wonderful hall at the Center each week for 3 hours from September through June or July. We are able to learn and share the richness of Latvian music and dance by performing at key events in the Seattle Latvian community as well as for local community events (NW Folklife Festival), at the North American Latvian Song and Dance Festivals, and of course, the epic Latvian National Song and Dance Festival in Riga. This summer, we had the thrill of participating in the Song and Dance Festival and joined the largest group of participants in the history of the Festival (over 40,000 singers, dancers, musicians and artisans) due in large

I-361-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you and the Latvian community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-361-001

part from the support and guidance of the Seattle Latvian Community Center and its numerous organizations. Being able to be a part of something so culturally significant is something younger generations should be able to look forward to. Trejdeksnitis (tray-decks-neet-iss) has been in existence since 1962 and there would be a huge void if its Latvian Center home no longer existed.

Because I see the importance of learning and sharing cultural heritage, over the years my involvement in the Seattle Latvian community has deepened. I have studied Latvian language at the UW Baltic Studies Program, which has strong ties to the Center. My daughter attended the Latvian Saturday School here for 2 years and joined me in the dance group for 4 years.

I have been singing with the Latvian Vocal Ensemble Sigulda for the last 2 years. This wonderful collection of singers, and our dedicated director, rehearse at the Center weekly (in the hall or church) and perform for church holidays and important cultural gatherings.

I volunteer for events and fundraisers as I can, to support the hard working, dedicated and resilient people that are the roots that keep the American-Latvian community alive.

This Center is a beacon for Latvian-Americans in the Pacific Northwest, and needs to continue to act as a central hub. It needs to be a hub for social and cultural gatherings, to provide people with the opportunity to network with one another, allowing experiences and information to be passed around. The sharing of ideas is arguably one of the most important facets of a progressive society as it promotes collaboration amongst people and helps define what is commonly called community.

I-361-001 The unity of the Latvian community has played a huge role in preserving its culture over time.

The Seattle Latvian Center needs to remain as a beacon of culture, especially as younger generations may find the need to become educated about their heritage.

Sincerely,

Sandra A Vetter

September 22, 2013

Dear Sound Transit Board,

I submit the following letter of comment concerning the Draft EIS report Sound Transit prepared for the Lynnwood Link Extension project.

I-362-001

As a resident in the general vicinity of the 185th St Station (approximately ¾ mile west of the station and just N. of N. 185th St.), one of my major concerns is accessibility to the station by means other than the automobile. The station and train route will obviously have the most visual and auditory impact to those residents living adjacent to the sites. On the other hand, the congestion that comes with increased traffic flow to and fro the station will have an impact to all the residential neighborhoods surrounding the station.

Transit service and connectivity, as well as safe pedestrian and bicycle routes need to be prioritized in the station area planning. This should include:

- Covered walkways, bike lanes, and dedicated transit lanes as part of the rebuild of the NE 185th St .bridge on I-5.
- Promote pedestrian safety and access by building sidewalks to/from the station
- Parking should be provided as part of the station, but the number of parking spaces should be carefully considered. Build too many, and single occupancy vehicular traffic will be encouraged. Build too little, and residential streets may be over run with station parking. I am a proponent of a 300 car capacity parking garage on the west side of I-5 along NE 185th St..
- Add appropriate traffic control devices and/or design elements to promote safety for commuters, neighborhood residents, and vehicles at the redesigned intersection of NE 185th St (as shown in Option 1).
- Transit access loop turning into the station from 8th Ave NE and exiting the station via NE 185th St (as shown in Option 1).
- An at-grade train track and center platform design as shown in Option 1. At – grade is preferable over the visual and auditory impact of an elevated train.

I am concerned that the N. 185th St. station could become a large Park and Ride facility, when it should be so much more. The station will be a large physical presence in the community. As such, its design elements should support the surrounding community in order to mitigate the visual and sound effects of the station and train route. These design elements should include:

- Architectural and artistic elements to the station building and surrounding area to create a station that is aesthetically pleasing and reflective of our community's cultural diversity.
- Locate the parking garage on the West side of I-5 along NE 185th St (as shown in Option 1). This parking garage could help with the parking needs of large sports events such as the high school football games and soccer tournaments
- The station design should include public gathering places to enjoy music and mingle with friends. Provide inside and outside public gathering places. Include a

I-362-001

Your comments about the NE 185th Street Station design are noted. Appendix F, Conceptual Plans, contains Sound Transit's current design for that station.

The light rail stations will have pedestrian, bicycle, and transit facilities to support and encourage multi-modal access. The project will construct ADA-compliant pedestrian facilities fronting the station areas and along roadways that are reconstructed for the project.

Design elements of the station and parking garage will consider the context in which the light rail facility is located. However, the final design of the station will focus on providing the necessary features of a light rail station.

Station parking facility sizing balances the need for parking supply with other good multi-modal connections in order to serve the needs of the region as well as local communities. Sound Transit promotes multi-modal access to their stations by including pedestrian and bicycle facilities, including bicycle parking, and by integrating bus and paratransit.

I-362-001

solarium with bright light, public art, plants inside and an outside gathering place to rest, eat and meet your neighbors and enjoy the music of buskers.

I-362-002

Shoreline, like so many other communities in the Pacific Northwest, prides itself on our parks, tree-lined streets and a heightened environmental consciousness. A few years ago we increased our property taxes in support of our parks and green spaces. Protection of our tree canopy is a community priority. The Lynnwood Link Expansion project will necessitate the removal of trees along the train route. The station site itself will also create more paved surfaces. To mitigate the loss of trees and vegetative cover, Sound Transit should:

- Preserve as many of our mature trees as possible
- Replant the areas disturbed to restore and maintain our "urban forest"
- Incorporate public green spaces adjacent to the train station area
- To mitigate the removal of CO2 sequestering services of mature trees and increased paved areas, incorporate green roofs in the station area design
- Wherever possible, use permeable pavement to minimize the overall increase of impermeable surface areas and its effect on surface water management.

Respectfully submitted,

Barbara Guthrie
18531 Ashworth Ave N.
Shoreline, WA 98133

I-362-002

Sound Transit will preserve as many mature trees as possible, and replant disturbed areas. The incorporation of green roofs could be incorporated in the design, but that decision would be made during final design.

Sound Transit requires all projects to consider low-impact development (LID) methods, such as permeable pavement, as a first choice for stormwater treatment (Design Criteria Manual, July 2012). Sound Transit will evaluate the feasibility of permeable pavement throughout the project area.

Re: Latvian Center

Prior retiring my company - BOAS Inc. - from active cultural resource work, we had the opportunity to serve Sound Transit as a contractor on the main Link Light Rail project. It was overall a positive relationship and I have always supported public transit, as a concept and personally.

I-363-001

Little did I expect that the Sound Transit project beyond Northgate would negatively impact the heart of the Latvian Center, a place that is the core of the Latvian American community in Seattle, a community of which I am a part. As an anthropologist, I have worked with many communities as they have struggled with forces that are a constant threat to their existence. The current interaction between Sound Transit and the Latvian Center community (including American of Latvian, Lithuanian, and Estonian descent) is not unlike others I have worked with. Except this time it is happening in the context of my own ethnic community,

Community centers of various ethnicities are often the key points of contact between members of a specific community as members strive to maintain an ethnic identity. This process of retaining identity while becoming a part of the American fabric is an important aspect of our larger society. You will undoubtedly be getting many letters detailing the significance of the Center from individuals and institution to whom it is of great and sustaining importance. I would like to add my name to that of my fellow American of Latvian descent. Please do seriously reconsider alternatives to the impact your current plan will have on this community.

If I can be of any assistance in this process, please let me know.

I-363-001

Thank you for your comments describing the importance of the Latvian Center to you. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

RE: Sound Transit Link Light Rail system impacting the Seattle Latvian Church and Center at 11710 3rd Avenue N.E., Seattle, WA 98125

Dear Ms. Swift,

I-364-001 I am writing this letter out of concern for the impact of the Lynnwood Link Extension on the Latvian Church and Community Center located at the above address. As it is currently slated, any of the link options provided in the DEIS by Sound Transit will severely limit, if not bar, access and use of the community center that is home to many, and that simply cannot be allowed.

This center is home to more than just a church, it is also the local hub for all Baltic (Estonian, Latvian and Lithuanian) communities and their respective activities. Much of my life has been spent at the Latvian Center, including but not limited to: Saturday morning Latvian language school, Sunday church services, dance practices for the local folk dance ensemble "Trejdeksnītis" and confirmation classes. This church and center has seen the beginnings of many new lives, as well as the final farewells for others. These activities have had a profound impact on who I have become as a person, and continue to shape the youth of the Latvian American community here in Seattle. I am concerned that limiting access and use of the Latvian Center during and after construction will have an unfathomable impact on the Latvian community as a whole. In 1969 our first Latvian center in the Wallingford area of Seattle was acquired by eminent domain for the construction of a park. This was perceived by the Latvian community as an opportunity to construct the very center that is now threatened by the Lynnwood Link Extension. From 1969 to 1972, when the construction of the new center was completed, the Latvian community had a difficult time keeping the church, school and cultural activities operating in various rental spaces. This time around relocation cannot be an option, as many families have moved to the area in order to be proximate to the center.

Even if access and use of our center is barred only for the duration of the construction of the link, it would have a devastating impact on our community, especially the youth who are currently learning what it means to be Latvian. Without a home for our Latvian community during those years, I feel that there could be an insurmountable decline in community participation and engagement in cultural activities. I urge Sound Transit to continue to explore different options in the engineering and construction of this link segment that would not impact this center as drastically as it is currently slated to.

I thank you for taking the time to read my comments and concerns, as well as those from other members of the community. I sincerely hope you come to recognize the grim situation we currently find ourselves in.

Sincerely,

Eduard Raisters
Project Lead, The Gear Works, Seattle

I-364-001

Thank you for your comments describing the importance of the Latvian Center to you and the Latvian community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained during construction and operation of the project.

Re: Lynnwood Link DEIS/Seattle Latvian Lutheran Church and Community Center

I-365-001

This letter concerns the Lynnwood Link DEIS issued July 26, 2013, involving the Seattle Latvian Church and Community Center located at 11710 - 3rd Ave NE.

Much has already been said about the Latvian Church and Center and its impact not only on the Latvian community but other Baltic communities and perhaps even other small countries no one seems to know much about. Since from 1950 and on I witnessed many of the events leading up to today's crisis so I believe I can relate some of the thoughts, feelings, and most of all, determination, behind building this Church and Center.

Those of us lucky enough to emigrate to America clearly understood our good fortune. After all, we had just escaped our homeland feeling pretty lucky being still alive, spent years as refugees, and once here, spent years looking for family members who, as it turned out, had not been so lucky. Very quickly it also became clear that there was a very energetic effort in place to delete the very country of Latvia and its language off the map, off the face of the earth. Against their will Latvians were scattered throughout the vast Soviet Union and other ethnicities were imported (usually against their will) to Latvia. Seeing and hearing this, we, the lucky ones, felt obligated to prevent the Soviets from accomplishing their goal. Besides, we now lived in America..

Naturally, this early on, language was a barrier so the Latvians migrated toward each other for company. I still remember the many, many discussions around the dinner table comparing, telling and retelling each other's stories, experiences. At the same time it became obviously necessary to include others outside our personal circle of friends but with the same background which eventually led to the forming of the church. That was done but we had to use other church facilities for our services. Eventually as families settled in, got jobs, paid off their emigration and education expenses (most were educated but without US credentials) the next step was to

1

I-365-001

Thank you for your comments describing the history of the Latvian community in the US and in Seattle, and the Latvian Center's importance to the community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained during construction and operation of the project.

I-365-001

acquire a church and center of our own. I believe our first church and center at 43rd and Densmore (and how we lost it) has already been thoroughly discussed.

The 43rd and Densmore matter was a huge setback, left us with very little money, and begging and pleading for other facilities in order for us to continue our activities. It must be said there were many, many helping hands in that regard but we still did not have a home of our own.

In time a property was found, donations and personal loans made and eventually we commenced building our "Latvia in Exile", still with the determination that we would not be wiped off the face of the earth. This "Latvia in Exile" purposefully was designed and built to handle all sorts of activities, activities to maintain and teach our language and culture (and have some fun as well). Large and small spaces were provided for innumerable activities, many focused on teaching our children about our heritage. There were classrooms, meeting rooms, a large kitchen, a large hall with a stage and one that could be used for dances, balls, and large meetings. I must point out here that these dances were family affairs attended by grandma, grandpa, mom, dad, the teenagers and even the little kids. They were all generational and, on a personal note, great fun.

A somewhat unexpected outcome of the Church and Center is that it has become our day by day, nail by nail living history of us all for the past 65 years. The moment you walk onto the property you see evidence of who did what, when. We see the work of an uncle (now deceased, but remembered) who did the landscaping, we see the work of a father, grandfather or even great-grandfather who worked on the roof, we see the building a father, and now grandfather, spent hours, days, weeks to design (during his "free time") all with the goal of leaving something for his family and their future. It is a walk down memory lane for those of us who knew these people, but more importantly it is a living monument of the work done by the parents, grandparents and great grandparents who first lost everything, started over, started over again, and then over again until they finally prevailed.

No spanking brand new building will ever replace this facility. Mitigations you promise and swear by will do nothing but, in time, make the place so unpalatable that eventually people will stop coming (Christmas Eve candle light service with trains zooming by every couple of minutes?). In essence, what the Soviets could not accomplish Puget Sound Transit will - all under the guise of fairness and freedom for all.

Dzintra A. Zommers
5341 Ruby Way NE
Bainbridge Island, WA 98110
dzommers@q.com

The building was built without asking for any handouts or favors from the government or any other entity whatsoever. It was built solely with the community's own labor. Vacations were given up as were weekends and holidays.

Re: Sound Transit Light Rail system impacting the Seattle Latvian Lutheran Evangelical Church and Seattle Latvian Community Center at 11710 3rd Avenue NE, Seattle, WA. 98125

Dear Ms. Swift,

I-366-001

I am writing to you today to add my voice to the many concerns regarding the Lynnwood Link extension of the Sound Transit Link Light Rail system along the eastside of Interstate-5. This extension of Light Rail Link will have devastating effects on not only the Latvian community of Seattle, but the Baltic community of the Pacific Northwest.

While I did not grow up in Seattle, as many of the people you have been hearing from did, I spent a great deal of my adult years there, with the Latvian Community Center as the epicenter of my activities. I have spent countless hours singing in the Latvian women's choir, dancing with the Latvian folk dance group, teaching Latvian school, worshipping at our church, meeting foreign dignitaries, and celebrating the many milestones of my ancestors at our Latvian Community Center. I have met and befriended people from all around the world- from students who are now teachers, to pensioners who have told the most amazing first-hand stories of life in Latvia, to the best friends anyone could ever ask for.

Though I have spent much of my life away from the Seattle Latvian Center, I have never felt closer to it. The Latvian Community Center has been part of my life for over 20 years. I simply can't imagine a Seattle without this institution. The level of activities and pride in the Seattle Latvian Center are greater than ever before. If the Latvian Community Center were to cease to exist, the impact would be devastating and demoralizing to our community. The loss would extend to social, cultural, religious, educational, and developmental activities.

I urge the Sound Transit board members, engineers, and planning committees to find a solution that allows the Latvian community to retain its present property and location in a way that maintains its viability. If our community should be forced to relocate itself, for the second time in forty years, it would be an insurmountable challenge.

Thank you for your consideration. I truly hope a reasonable solution can be found.

Sincerely,

Dina Alita Kancs
dinaalita@gmail.com

I-366-001

Thank you for your comments describing the importance of the Latvian Community Center to you. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Comments on Lynnwood Link Extension Draft EIS

Attention: Lauren Swift
Via email: LynnwoodLinkDEIS@soundtransit.org

Dear Ms. Swift:

This letter is written in support of the I-5 Light Rail alternative based on ridership (5.9 million new riders/18.5 million riders annually), capacity (8,880 riders/hour), capital costs ($108/ rider w/estimated ridership) and annual operating costs ($1.24/rider w/estimated ridership). [*Alternative Analysis Report*, p 3-50]

I-367-001

Preferred alternative station placement in Lynnwood
Regarding the placement of the Lynnwood station, **this letter rejects C-1** because of its negative impact on existing property owners (106 parcels, 77 residences and 31 businesses) and its negative impact on Scriber Creek Park. There is no sound economic reason to run the elevated railway above 52nd Ave West, which is developed, instead of along I-5, which is not.

C3: ALONG I-5 TO LYNNWOOD PARK-AND-RIDE STATION

I-367-001

Your comments about the Segment C alternatives are noted. The Preferred Alternative evaluated in the Final EIS includes a modified Alternative C3. This alternative minimizes Scriber Creek Park and wetland impacts, and realigns the guideway and station to better connect with the Lynnwood Transit Center.

I-367-001 **Regarding alternatives C-2 and C-3**, our project support hinges on two things: parking garage access and impacts to Scriber Creek Park and the Interurban Trail. Of the two alternatives, C-3 has the least impact on Scriber Creek Park and C-2 the least impact on the Interurban Trail. As proposed, C-2 is more likely to attract ridership because of ease of access to the rail station. However, we do not believe that the C-2 proposal is the best solution for commuters, residents or the environment.

I-367-002 Regardless of the alternative chosen, expanded parking at the transit center is essential as it is already over-capacity. **For aesthetics and practicalities, the logical location of the parking garage should be in the current southeast park-and-ride lot, east of 46th Ave West.** The Draft EIS includes analysis only for locating the parking garage west of 46th Ave West.

Alternative parking proposal for C3.

- First, this section of the park-and-ride (southeast of the transit center) is in an area of negative slope relative to 200 Street SW and the transit center. Thus an elevated parking garage would be less visible from residences and businesses.

- Second, an elevated station could connect directly onto the parking garage, which could serve as the foundation for a pedestrian and bicycle walkway to the transit center area (perhaps exiting alongside the existing 4-way stop, east side). This walkway could also provide ADA-compliant access to the transit center.

  Without easy access, the distance from the transit center and elevation differential will be a barrier to ridership for the C-3 alternative. For example, the walk from the (current) leased Northgate parking garage spaces (southwest corner) to the transit center is approximately 200 feet, on level ground. The Lynnwood walk could be as much as 500

I-367-002

The current design for the station and garage at the Lynnwood Transit Center for the Preferred Alternative includes some of your suggestions: the garage is located to the east of 46th Avenue West, and the station would connect to it. The Preferred Alternative would result in approximately 530 more spaces than there are today.

I-367-002

feet and on an incline.

- Placing the parking garage alongside the rail station means that the current transit center would not need relocation. It would, however, require re-engineering with regard to exit-and-entrance paths. It might be reasonable to allow access only on the north side, for example, via 46th Ave West, and exit only on the southwest side along the perimeter of the existing parking lot via 48th Ave West.

With the parking garage placed in the current southeast section of the park-and-ride area, we support C3, assuming limited impact on the Interurban Trail.

A word about economic impacts

I-367-003

At the Lynnwood public meeting on 14 September, some citizens expressed concern that the transit station would result in decreased property values. Research suggests the opposite if the project is implemented well.

Research on property values in San Francisco after the 20th anniversary of the BART system identified the "rent premium" associated with being within one-quarter mile of BART was $34 per month. In addition, the models suggest that a house immediately adjacent to BART would have a resale value approximately 38% more than an identical home 35 kilometers away and not near BART service. Researchers have found similar increased property values in Buffalo, NY; eastern Massachusetts; suburban New Jersey; suburban Philadelphia; Portland, OR; and St. Louis. [1,2,3,4]

In addition, residents of multi-modal neighborhoods have lower total transportation costs than people who live in "automobile-dependent" communities. Moreover, proximity to transit is a boon to employment and education centers. [5]

However, it is important to minimize nuisance effects, such as noise and poor aesthetics. This is one research finding that bolsters building the parking garage in the southwest corner of the existing park-and-ride and works against alternatives C2 and C3 with the elevated train running along 52nd and through the park. [6]

I-367-004

Preferred alternative station placement in Mountlake Terrace

As with the Lynnwood location, we want to make sure that the light rail station integrates with and complements the existing transit station. In this instance, there is also a new parking garage to consider. **This parking facility is already over-capacity on many weekdays**. It is critical that the light rail system integrate seamlessly with parking and that parking at the Mountlake Terrace Transit Center be expanded to accommodate additional riders.

- The proposal to maintain parking at the current 880 spaces is insufficient (B1).
- The proposal to expand parking by 200 spaces is insufficient (B2A) but it is the best of the alternatives because it considers the need for expanded parking.

I-367-003

Your comments about the potential economic impact of the project on property values are noted. See Section 4.3.4 of the Final EIS for a discussion of this topic.

I-367-004

Station parking facility sizing and design is balanced with the need for good multi-modal connections in order to serve the needs of the region as well as local communities.

As with all its light rail and parking facilities, Sound Transit will design the Mountlake Terrace Transit Center Station and parking facility to fit well within the community, and to effectively provide access. The Preferred Alternative would not add more parking spaces, but the Final EIS includes options at the Mountlake Terrace and the Lynnwood Transit Center that would increase the overall total compared to the Draft EIS alternatives. Section 3.2.7 of the Final EIS discusses the proposed parking facilities.

Thank you for the opportunity to comment on these proceedings.

Sound Transit
Draft EIS Comments c/o Lauren Swift
401 S. Jackson St.,
Seattle, WA 98104

Dear Sound Transit:

I write to state my concern about the fate of Latvian Church & Community Center as you proceed with Light Rail extension to Lynnwood. On this subject you will have already heard from many Latvians, Estonians and Lithuanians, who for obvious reasons want to save the Center for their own unique purposes of cultural and religious expression and preservation. My perspective comes at one remove from those of Baltic heritage but it is nonetheless deeply felt. I have no Baltic family lineage but my wife of 40 years is Latvian-American. Through the decades I have learnt a good deal of the Latvian language, sufficient to take some part in the richness of this vibrant culture.

You should keep in mind that there are many like me, non-Balts who are yet part of the extended reach of the Baltic tradition and who value it profoundly. It is not only Balts who go to the wide range of events at the Latvian Community Center & Church nor it is only Balts who see the beneficial workings of these institutions on broader society.

I-368-001

While I have nothing against the expansion of light rail, and, indeed, as a Lynnwood resident welcome it, I do feel you need to rethink the effect of your plans and revise them in such a way as to leave the Center and Church as undisturbed as possible.

Yours very truly,

Richard C. Wiest
2030 151st PL SW
Lynnwood, WA 98087-6345
Tel. 425-678-8774

Seattle, WA 98104

Comments on Lynnwood Link Extension Draft EIS

Attention: Lauren Swift
Via email: LynnwoodLinkDEIS@soundtransit.org

Dear Ms. Swift:

A few thoughts concerning the Lynnwood Station and MLT stations.

Placement - Lynnwood station, I reject C-1 and C-2 because of their negative impact on existing property owners, their negative impact on Scriber Creek Park, and poor use of existing right-of-way (I-5 corridor). There is no viable reason I can see to run the elevated railway above 52nd Ave West, instead of along I-5.

C3: ALONG I-5 TO LYNNWOOD PARK-AND-RIDE STATION

Alternative C-3 is my preferred option, especially if the parking garage is put where the current transit center parking is at, and expanded vertically. The same goes for Mountlake Terrace Freeway Station, increase of parking capacity is necessary (I currently live very near it and frequently the parking is full). I do understand option C-3 impacts the Interurban Trail but compared to alternatives C-1/2, it has the least impact on Scriber Creek Park and surrounding established neighborhoods.

I-369-001

Your comment stating your preference for Alternative C3 is noted. The Preferred Alternative in the Final EIS is a modified Alternative C3, with a parking garage east of 46th Avenue West. See Appendix F, Conceptual Plans, for the current design drawings.

I-369-002 Expanded parking at the transit centers is essential as they are already over-capacity. The logical location of the parking garage should be in the current southeast park-and-ride lot, east of 46th Ave West. The Draft EIS includes analysis only for locating the parking garage west of 46th Ave West which I feel negatively impacts/displaces too many established, developed areas.

With the parking garage placed in the current southeast section of the park-and-ride area, I support C3knowing that some impacts on the Interurban Trail will require mitigation.

I-369-003 It is important to minimize nuisance effects, such as noise and poor aesthetics. This is best accomplished by utilizing the I-5 corridor to its maximum as those 2 issues are currently being mitigated to an extent (sound barriers and walls). Using the limited access area improves the security of the system (minimal access to passers-by).

Rolf Vitous
5904 236th St SW
Mountlake Terrace, WA 98043

I-369-002

The Preferred Alternative includes a parking garage located on the east side of 46th Avenue West.

I-369-003

Your comment about minimizing nuisance effects by utilizing the I-5 corridor is noted.

September 22, 2013

Sound Transit
Draft EIS comments
c/o Lauren Swift

I am commenting on the Lynnwood Link DEIS issued July 26, 2013. As a member of the Seattle Latvian Community, whose Community Center and Church at 11710 - 3rd Ave NE in the Northgate area of Seattle, scheduled for destructive impacts should any of the alternatives be approved, I am writing to voice my concern over the proposed action.

The decision impacts not only the Latvian and Baltic communities, who have been active within the halls of the center for over 40 years. Countless other groups have used the center and continue to use it for their own functions, meetings and church services.

I-370-001

The loss of the entrance/exit to the center may as well be seen as a total loss of the property, a problem that could be solved with a better alternative than the ones currently presented.
The meaning behind the church and community center has been a monument to a struggling, small, immigrant community who built the structure; a testament to a people who were able to escape Soviet-occupied Latvia and make a new life for themselves and future generations in the Seattle area.
The gravity and impact of removing this church and community center from us would be huge, the impact of which would be reflected on the children and community who would have no place to go for some time.

Given the aging Latvian community here in Seattle, the idea of relocating is not very viable. I hope that a solution can be created that would allow for the progress of Sound Transit as well as the continuing existence of the Latvian Community Center.

Sincerely,
Monika Hanley

I-370-001

Thank you for your comments describing the importance of the Latvian Community Center to the Latvian Community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained.

To Whom it Concerns,

I-371-001

My father passed away in 2007. When my brother and I went though his belongings, we found, tucked away in a box along with his yearbooks, diplomas and other important documents, a spiral-bound notebook. I can best describe it as a project record, a yearbook in its own right, showing the various stages of the construction and of the completion of the Seattle Latvian Center.

This document was written in 1972, long before "PC" and "Mac" were household terms; long before, with the simple click of a mouse, one could apply Latvian fonts with its own custom accent marks that make each word more legible to its Latvian reader; long before there was a Kinkos on every corner or a Shutterfly from which one could order a custom-printed and professionally-bound hardcover book. In 1972, someone keyed this document on a typewriter, added BY HAND page after page of accent marks, photocopied pictures, timelines & ledgers, then penned a custom message to each receiver: "Dear Mr. & Mrs. Aldis L. Andrejevs, thank you for your donation."

Why? Why would someone spend all of that time to put together a construction report for a couple hundred members of some obscure community? For the same reason my dad kept it for 35 years along side his other most sentimental records – because it's important; because that report represents a monumental event for Seattle's ever-growing Latvian population. It marks the time in our history when we got our very own community center.

I don't know if you know anything about Baltic immigrants, or the vast number of cities where populations of Latvians have sprouted up. I won't bother you with the historic details of our ancestor's exodus from the fatherland, but I will assure you that those who found their way to the shores of Elliot Bay were a proud people who understood that the only way to maintain our Latvian heritage, culture and language was to give themselves and future generations a gathering place - a place to be used for education, a place to celebrate spirituality, a place for open forums, exchanging ideas, and social events where young Latvians (who would otherwise have no way to interact with other Latvian youth), could meet, perhaps even fall in love, and add to the population a couple of kids named Markus and Daira.

The author of this report, Edvins Circenis, included this passage within its first few pages. It's titled "For the Latvian Youth and our Country's Freedom".

"The last clanging hammer has rung, quiet now is the singing saw, the hurried diligence of the workers has finally come to an end. Among a grove of 100-year-old pines stands our newly completed church & community center.

This new center affirms our faith in the future of Latvia and in its freedom. It will serve to house our spiritual and public forums and, more importantly, will harbor the growth of our Latvian youth to insure our culture and our beliefs will not disappear with future generations.

Let this center & church be a symbol of our Latvian culture, our Latvian spirit and our Latvian togetherness. May it give us the strength to survive and to fight for that which is most important to us – our country's freedom."

My grandmother just turned 95 years old this month. She and my grandfather worked along side several other volunteers to build our center. Although her short-term memory fails her from time to time, her long term memory is still sharp as a tack. I am one of the lucky few who still get to hear the stories direct from the source. "Daira", she tells me, "with my own two hands, I hammered nails into

I-371-001

Thank you for your comments about the importance of the Latvian Community Center to you, and the larger Latvian and Baltic communities in Seattle. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-371-001

that church ceiling." My grandmother is one of the proudest of the proud – I've heard most of the stories of her accomplishments: from her days in Germany during the war, working in a hospital with no nurses training, to her time at Boeing, where she secured a laboratory job for .80¢ an hour, just barely speaking English, supporting a crippled husband and 2 small children, and never having worked in a lab a day in her life! Despite all of her achievements, one of her proudest moments to date is helping to build our community center. When her family moved to Seattle from Houghton, MI, the local Latvian Church funded the move with what seemed like an impossible sum of money to a struggling, immigrant family. By helping to build the center & church, my grandmother feels like she gave back to the community a gift of immeasurable value. And you know what, she's right. She did. They all did. It is their legacy.

Do you know how difficult it is to grow up a native-speaking Latvian, or Lithuanian, or Estonian in America? It's kind of like raising a Husky in Cougar territory – not impossible but really hard without the right support system. Now, imagine you're a Husky fan without a stadium. Taking the center away from us is like telling all the Husky fans in Seattle that they can still celebrate the purple & gold – they just have to do it in Pullman. It's not going to happen. You're going to lose members, you're going to lose support and, most importantly, you're going to lose future generations.

In my right mind, I cannot sit back passively and let our center be eradicated, not when the first thoughts that popped into my head when my son was born was what it was going to be like to take him to his first Christmas service at this church, or to his first day at Latvian School, or wondering at which social function, in the very same ballroom where his parents celebrated their matrimony, he might meet his future wife?

I beg you, from my generation of Seattle Latvians who grew up at this center, please, do not destroy this legacy. Don't take this birthright away from our children. There has to be another way, a way that will not disrupt the operations of the center & church, a way that will not leave hundreds of us wondering, "What now?" or, more appropriately, "Where now?"

I thank you for both your time and your consideration.

Sincerely,
Daira L. Anderson

Subject: Latvian Cultural Center Impact

I-372-001

I am a first generation Latvian who came to the United States in 1950 having lived with my family as refugees in Germany since the age of 8 months until I was 6 years old. Along with thousands of other displaced Latvians, my family lost everything they owned and had to start completely over in the United States.

I moved to Seattle in 1969 and immediately became active in the Latvian community. We had a small community center at that time, but with the heart, soul, labor, and love, built our present Latvian Community Center and Church. This was no small task and it has been the hub of our, both, cultural and religious activity. The center not only serves Latvians, but also Estonians and Lithuanians.

The center hosts weekly activities from Latvian school, to church services and various meetings. Throughout the years, I have been active in the drama group, choir, school and Latvian camp. I am happy to say that the next generation is still active in the center's activities and sending their children to Latvian school as well as participating in its many other activities.

To say we could relocate is a travesty. The cost of building a new center would be prohibitive to our community and the location would no longer be the conveniently central one for our community.

The sound transit committee NEEDS to hear our voices and RESPECT the cultural importance of our center and impact of SOUND TRANSIT'S potential destruction or negative consequences by the running of its line so near or through our center.

Respectfully yours,

Maira Rusis

Lake Forest Park, WA 98155

23 September 2013

Dear Sound Transit Board,

I am a huge fan and advocate for Public Transit. During the past dozen years I was instrumental in the urban design and station-area efforts in the Roosevelt Neighborhood that led to shifting the planned Light Rail alignment, updating the neighborhood plan, and re-zoning the neighborhood. This was all done to encourage and foster Transit-Oriented-Development, and embrace strategies of "smart growth", as the community evolves with its implementation of Station-Area-Planning. Furthermore, I spent several years as a member of Sound Transit's Citizen Oversight Panel. I do not list these accomplishments here to claim that my comments should receive any extra weight, but rather to give some background to explain my previous experiences and understanding of transit and urban design.

As a resident, member of the public, and supporter of transit, I am excited by the creation and ongoing expansion of a region-wide public transit system. I recognize and understand that this is not simply a means of "moving" us, but rather --through a network of "station areas"-- integration into our neighborhoods; connecting and complementing our communities. Unfortunately, in reviewing the Lynnwood Link DEIS, I am frustrated and disappointed by much of what is outlined.

I-373-001

Simply put, it seems that the communities north of Northgate are being asked to accommodate a series of large Park & Ride facilities in the service of a commuter railroad. No doubt, one of the purposes of Sound Transit's Light Rail system is to meet the needs of commuters, but this is not its only use, nor the only goal identified by the Sound Transit Board. The Lynnwood Link Extension needs to serve commuters, AND ALSO to support, and be oriented towards, the local neighborhoods. These are the communities that will live with, and be the principle support of the system.

The Lynnwood Link must be much more than a commuter-centric system, with park-and-ride stations. Sound Transit must design a system, build stations, and facilitate station-areas which all work together to create an integrated whole that serves the public AND provides vital community hubs as part of the entire regional public transit system. Sound Transit needs to undertake these expansions of our transit system as one key factor in the overall upgrade, development, and improvement of our urban environment. It would be a sad mistake, and the squandering of a once-

I-373-001

Your comments about the purpose of the Lynnwood Link Extension are acknowledged. The proposed levels of parking are part of a balanced approach to provide access to the light rail line, allowing patrons to arrive by bus, walking, biking, or by car. Sound Transit supports and encourages transit-oriented development around its stations and the integration of its stations into the surrounding community. The purpose of this project is to expand Link light rail from Northgate north into Shoreline, Mountlake Terrace, and Lynnwood; see Chapter 2 for the project's Purpose and Need Statement. See Section 4.5.2 of Final EIS for practices Sound Transit uses to help integrate the stations into the community. As described in Section 4.2.4 of the Final EIS, in areas where local jurisdictions have indicated a desire to attract transit oriented development and have adopted regulations consistent with this, the Lynnwood Link Extension would support those goals and policies.

I-373-001 in-a-lifetime opportunity, to just the build a railroad the quickest and easiest way with little consideration of integrating and orienting towards the community it serves.

So I offer my comments on the Lynnwood Link DEIS with the hope that Sound Transit will make decisions to increase the system's integration and connections to the communities through which Light Rail will operate. By making smart choices in design and planning the Lynnwood Link can create a truly great extension of the existing system with vibrant station areas, and transit-oriented neighborhoods.

NOTE:
To present my comments, I have organized them into four sections. The first three sections each focus on a single broad concept which applies to the entire system as shown in the DEIS. These topics are: Connectivity, Transit-Oriented-Development, and overall Layout & Strategy. In a fourth section I address each of the separate stations individually.

Section 1: CONNECTIVITY

There is no other item more important to the success of this transit system than Public Safety and Accessibility. When getting to and using the system, if the public does not experience a basic level of ease, comfort, and sense of safety, then they will not use the system.

I-373-002 I bring this up because there are few details in the DEIS which prioritize pedestrian, transit connectivity, and bicycle access to the system. In some cases this may simply be that the details remain to be created once the station alternatives are selected; or in some cases these are details which will be dealt with by local municipalities. But this is one of the areas which left me feeling that the system was being designed more to accommodate park-and-ride commuters, and less to provide for local non-vehicle access (foot, bike) and transit connections. Bus stops are shown in places across busy (and certain to get busier) arterials; parking garages indicate an expected great increase in traffic congestion, without commensurate increases in sidewalks, crosswalks, traffic signals. This is all the more important since studies show that ridership participation can be deeply affected by rider's experiences making connections and waiting at transit stops.

I-373-003 One of my biggest frustrations with Sound Transit's long-term planning is the failure to connect new transit developments with existing corridors, transit, and travel patterns. The Link Light Rail system has always been said to be a "spine" from which other transit will connect. Well, the most obvious west/east "rib" route north of Seattle is the SR104 corridor, and the plans as presented in the DEIS do not consider this at all. Consider this corridor from west-to-east, starting in Edmonds: there is the ferry dock and Amtrak/Sounder Station; Edmonds itself; a center of development at 100th Avenue W; a major connection to Aurora/SR99 with the Aurora Village Transit Center; continuing through Ballinger with the center of development just east of I-5; Lake Forest Park; and then onto SR522 through Kemore; Bothell (and the UW campus there); on to Woodinville; and beyond.

Imagine someone getting off the ferry or train in Edmonds who wants to get onto Link to get to UW, downtown, the airport, etc. Same thing for folks at the Bothell UW campus, or coming in on a bus from the NE (Woodinville, Monroe, etc). All the local transit is going to want to make connections to Light Rail, and the DEIS does not mention how any of this is going to work. And this is my fear: that its NOT going to work, so Link will NOT be an attractive alternative for any of the potential riders from the ferry, Edmonds, UW Bothell, etc.

I-373-004 With no description given, it appears that no thought has been given to how new or existing bus routes are going to get to any of the proposed stations. Many routes will most probably want to connect to the 185th station, but for instance there's simply no easy way to/from the NE to this station. It would appear that all of these stations --positioned as they are next to the highway at overpasses-- are going to be difficult for buses to connect to. (imagine an eastbound 331 bus on Ballinger Way needing to take19th-->196th-->Perkins-->10th-->185th to connect riders to the 185th Street station....)

Moreover, the current express service buses, like 522, 312, 372, etc. are going to want to connect to Link to get commuters downtown – How (where?) are these connections going to work, and aren't

I-373-002

The Draft EIS Transportation Technical Report includes an inventory of pedestrian facilities within 1/2-mile of station and bicycle facilities within 1-mile of stations. This inventory is a basis for Sound Transit to work with local jurisdictions on pedestrian and bicycle enhancements to improve accessibility and ridership at stations. Sound Transit also coordinated with local bus operators to develop bus integration plans to complement the rail project. These provide a basis for future transit integration work. Section 3.2.5 of the Final EIS discusses the nonmotorized facilities that will be included in the project. Stations will have pedestrian and bicycle facilities, including bicycle parking. Stations will be designed to accommodate pedestrians, bicyclists, and bus riders as part of a balanced approach to effective access.

I-373-003

Your comments about the SR104 corridor are noted. The purpose of the Lynnwood Link Extension is to expand the Link light rail system from Northgate north into Shoreline, Mountlake Terrace, and Lynnwood, while connecting with other transit systems and infrastructure. The previous decisions to build the Mountlake Terrace Transit Center at 236th Street rather than SR 104 recognized that major traffic corridors are not always the best places to create multimodal centers. Finally, the purpose and need identifies a major north-south trip market to be served; east-west trips may benefit and connect, but the line reflects the needs of the majority of the anticipated trips.

I-373-004

Before the light rail begins operation, Sound Transit will work with the other transit providers in the project area to revise service plans to provide improved or new connections to the Lynnwood Link Extension stations. Sound Transit worked with King County Metro, Community Transit, and Sound Transit Express to outline representative bus

I-373-004 these bus routes going to be greatly encumbered and slowed down by traffic congestion which is already bad at some of these station locations and certain to become worse with the increase of traffic (vehicle, transit, foot, & bike) once light rail service begins?

I-373-005 The issue of congestion at these station sites --bad, and bound to get worse-- CANNOT simply be considered something that the public is going to have to "get used to". With road traffic (vehicle, transit, bike) increasing at the same time of MANY additional pedestrians in crosswalks, there are certain to be threats to public safety (accidents) and obvious adverse effects to surface traffic flow.

I-373-006 Therefore, if these are to be the locations of the Link stations, much more must be done to design for the accommodation of transit connections. Some form of short Bus-Rapid-Transit (BRT) with dedicated bus right-of-ways leading to/from stations should be included in the Lynnwood Link plans at all of the stations so that transit is not as encumbered by surface congestion and rider transfers can be made quickly and safely.

Likewise, some of the alternatives shown in the DEIS negatively impact, or even eliminate, currently existing BRT infrastructure (i.e. Mountlake Terrace Alternative B4). This is a very bad idea. Not only should all of the current transit capabilities be maintained, but they should be accommodated and "connected to". For instance, Mountlake Terrace Alternatives B1, B2, B2A show no direct pedestrian connection to the neighboring "flyer stop", even though they are both elevated stations at the same site. There are many people who will want and need to transfer between these two systems, especially in the decades prior to the completion of Link to Everett.

Taken all together, these multiple issues indicate that connectivity needs to be better considered, planned for, and prioritized. The Lynnwood Link designers need to do a much better job accommodating transit riders connecting to Light Rail throughout this proposed extension of the system.

operation plans to serve the project to evaluate the effects of potential service changes for the EIS.

I-373-005

Chapter 3, Transportation, of the EIS discusses these potential issues. Sound Transit will provide mitigation at intersections with impacts from light rail that operate below level-of-service standards; see Section 3.6.4. Potential safety issues are discussed in Section 3.2.8.

I-373-006

The light rail stations will be designed to accommodate bus transit with bus facilities on-site. Connections to other nearby destinations via local transit service will be developed through a coordinated planning effort with partner transit agencies. The Preferred Alternative studied in the Final EIS assumes that the Mountlake Terrace light rail station will not displace the existing Mountlake Terrace freeway bus station, but future use of the existing freeway station would ultimately be decided separately.

Section 2: TRANSIT-ORIENTED DEVELOPMENT

I-373-007

There is almost nothing as important to the success of the long-term success of the Light Rail system than fostering Transit-Oriented-Development (TOD). It gives a station a ready source of steady riders, it turns a station-area into a destination for other riders, it makes transferring at a station more pleasant, and it engenders community support as it integrates into the community. Unfortunately it is sadly lacking in the current plan as presented in the Lynnwood Link DEIS.

Following Sound Transit's TOD policy, all the proposed stations were analyzed 5 months ago to determine the potential for TOD, and it was found to be mostly "limited". In some places this rating was raised to "limited/moderate" (i.e. 185th), but this assuming that a nearby landholder (Shoreline Schools) eventually transfers the property to be re-developed. This seems like a faulty assumption, since the presence of a light rail station is bound to encourage increased residential density and might require the school district to utilize its property for school expansion.

Most of the details proposed in the DEIS do not follow the Sound Transit Board's guidance to facilitate TOD strategies on its own property and in areas around its transit facilities. The sound transit TOD policy says (1st page, 3rd paragraph):
".....The legislation also guides Sound Transit to work with public and private interests to facilitate TOD. For example, Sound Transit is guided to work with local jurisdictions to set forth conditions for assuring land uses compatible with development of high-capacity transportation systems, such as providing for sufficient land use densities through local actions in high capacity transit corridors and near passenger stations, preserving transit rights-of-way, and protecting the region's environmental quality. Additionally, the legislation guides the agency, in cooperation with pubic and private interests, to promote transit compatible land uses and development, which includes joint development."

It appears that the Lynnwood Link conceptual design, as described in the DEIS, pretty much completely disregarded Sound Transit's own policy. The development of designs are directed to "facilitate TOD" (Sound Transit's words) -- NOT to simply study the issue and then report that, "nope, not much chance of TOD here..." (my paraphrase).

I have been told by Sound Transit staff that, "....every station site cannot allow for extensive TOD....", something I do tend to believe is true -- the fact is (as established by Sound Transit's own report), that for instance, NONE of the 4 proposed "Segment A" stations allow for appreciable TOD. Moreover, depending on which station sites are selected in segment B (Mountlake Terrace) and segment C (Lynnwood), the potential for TOD at those sites is limited as well....

I understand that this extension of Link Light Rail is never going to have the TOD potential of some of the station sites in Seattle. Likewise, it would be too much to expect that Sound Transit would site, design, and build every one of the Lynnwood Link stations to maximize TOD potential. But NONE??

Eight months after Sound Transit publicly commits to a policy of designing its transit projects to encourage and facilitate TOD, and the very next project design which is released to the public has little to none. It is frustrating that this project's planners chose to disregard the Sound Transit

I-373-007

Your comments about transit-oriented development (TOD) are noted. The station area TOD potential was assessed at all potential station locations and was based on existing conditions. Since the Draft EIS, changes have occurred at station areas and this information is reflected in the updated *Station Area Transit-Oriented Development Potential Report*, as referred to in the Final EIS. For example, the City of Shoreline has adopted a subarea plan with transit-compatible zoning near the NE 185th Street Station and is in the process of developing a similar plan for the NE 145th Street Station. Lynnwood Transit Center Station has been modified to provide better future development potential on privately owned properties within the City's designated City Center.

Overbuilding of a station or parking garage to provide development opportunities is a complex issue. As you mentioned, such options are anticipated in Sound Transit's TOD Policy, and Sound Transit will consider a joint development project if a number of conditions are met. Currently, there is no specific proposal for joint development at the Lynnwood Link Extension stations, but Sound Transit will continue to investigate possibilities.

The NE 8th Street corridor was not considered for detailed study because a tunnel concept would not meet Sound Transit's criteria for equitably selecting alignment types for its system (see Section 2.4). In addition, NE 8th Street is largely residential, would require sharp turns to reconnect with other north-south corridors beyond the section described, and construction period impacts would be very high.

I-373-007

Board's guidance and directions on something as vital to the system's success as Transit-Oriented-Development. This obvious oversight is the most significant short-coming of the project as proposed.

At some point in design and scoping -- especially after the Sound Transit board adopted an official policy and commitment to TOD -- there should have been a recognition that the current design was not meeting Sound Transit's own criteria. So we are now at a point in the process where the public is asked to comment on the alternatives listed in the DEIS -- and yet the list of alternatives is very obviously incomplete, since no alternatives provide even an average amount of TOD potential. In failing to develop a design which meets Sound Transit's own policies and goals, I find that in this way the DEIS is deeply flawed.

It seems like the lessons learned by Sound Transit a mere ten years have already been forgotten. At that time, the preferred alternative of locating a Light Rail station alongside the highway at NE 65th was realized to be a mistake --both by the local community AND the Sound Transit Board-- simply on the basis of the lack of TOD potential.

No transit station which is sited immediately adjacent to a highway will ever encourage --or even allow for-- effective TOD and integration into the surrounding community. By definition and simply geometry, half of the land adjacent to a station located immediately next to a highway can never be developed, because it is taken up by the highway itself. And then the other half of the the land adjacent to the station will never foster good, valuable, and attractive urban development, because all of that property, by definition, is next to a highway. Shifting the alignment and station locations even a few hundred feet (let alone a block or two) would make a world of difference, and that is exactly what Sound Transit choose to do at NE 65th -- even though it meant that the costs of developing that segment are now higher.

I understand that it must seem the obvious solution to run LINK along the edge of I-5 from Northgate to Lynnwood -- its simpler, and probably cheaper. But by choosing this 'easy' way, Sound Transit has disregarded what it has already learned about station areas. North of Northgate does not suddenly turn into a rural area, which simply needs to accommodate the passage of a train. Rather than serving the city of Shoreline, and helping to foster transit-oriented neighborhoods within the station areas, the current Lynnwood LINK design is little more than a commuter rail line.

This did not "have to be". This was NOT the only choice. When Sound Transit's planners were charged with the task of extending Light Rail north to Lynnwood in the I-5 corridor, it did not mean that the rails had to stay principally within the right-of-way of the highway. Instead of using the public land immediately adjacent to the highway, the alignment could have been a cut-and-cover route making use of the public utility right-of-way along 8th Ave. NE from 145th through 185th. A straight line, no complex and costly rebuilding of freeway overpasses and interchanges – and while still within the I-5 corridor it would have been that all-important few blocks from the highway which would have facilitated a MUCH greater potential for TOD.

I-373-007

The currently proposed station locations and siting shown in the DEIS don't allow for significant Transit-Oriented-Development, or efficient integration -- and that is exactly what is needed if Link is to be a success and have a consequential positive impact throughout our area. If the Lynnwood LINK is to truly serve the communities north of Seattle --and to meet the criteria, strategies, policies, and goals set by Sound Transit-- then a re-examination and adjustment of the project's design is necessary.

I believe the alignment and siting of stations should be adjusted to increase the potential for Transit-Oriented-Development. Even barring that, at the very least a number of steps should be taken to increase the potential for TOD at the station site which are proposed in the DEIS. These improvements to the Lynnwood Link Plan should include:

1. Choose the station alternatives which allow for the most develop-able land immediately adjacent to the station site.

2. Adopt whatever station configuration which does the most to screen the highway from the immediate station area.

3. Incorporate additional elements into the station to screen the highway from the immediate station area.

4. "Overbuild"/"Underbuild" – each station's design/lay-out/configuration should not simply accommodate development nearby, but actually incorporate development --such as public/ retail/commercial/residential space-- integrated as part of the same structure as the station itself.

5. Considering #1 above, if there HAS to be a parking garage (and it should not be a "given"), it should be as small and as far from the station as possible .

Section 3: LAYOUT AND STRATEGY

3.1 Layout:

Perhaps the biggest questions which are sought to be answered by the responses to the DEIS are: Which stations? And where? I have separate comments prepared regarding the details of each station individually in the section which follows, but here I think it is important to first address the extension as a whole.

This segment is defined by the end points of Northgate and the Lynnwood Park & Ride, between which there two relatively fixed station locations chosen (NE 185th and Mountlake Terrace), and three significant questions of additional station locations. This is without getting into the more detailed questions of each station's placement and elevation. These three principle questions of system layout are:

1. Station at 130th NE: Yes or No?
2. Station at NE 145th <or> NE 155th?
3. Station at 220th SW: Yes or No?

I-373-008

3.1.1 Question: Station at 130th NE: Yes or No?

Regarding this first question, there should positively be a station at NE 130th. Without it, everyone to the NE, and especially everyone to the NW from about 100th to 140th will need to make their way (by car, bus, bike, or foot) through all of the congestion at Northgate to get to the station south of the mall. This is already currently one of the most congested areas in North Seattle, and with the coming of Light Rail to Northgate (and its associated parking garage and connecting transit routes) the congestion is certain to get worse. This is no small factor, since whether or not people can easily get themselves to transit is often the deciding factor of whether they use the system. So yes, definitely build a station at NE 130th. I expect it will be a popular location and help the system's ridership numbers.

3.1.2 Question: Station at NE 145th <or> NE 155th?

Considering that there would therefore be a station at NE 130th (see 3.1.1 above), the next station should be at 155th, NOT 145th. A station at NE 145h would seem very close to the 130th street station, and a station at 155th more evenly divides the distance between a station at 130th and the planned a station at NE 185th. While the site at NE 155th is not the best for a station, the location at NE 145th and I-5 is certainly the worst spot for a station considered in the entire DEIS. The existing current conditions at that location are already terribly congested and often backed-up in every direction, and the idea of adding a station with thousands of boarding means a significant increase of pedestrians in crosswalks; connecting transit coming to this site; and hundreds of vehicles accessing the planned park & ride garage. Basically, with a station at this location there can expected to be utter gridlock at "rush-hour(s)", every morning and evening. Furthermore, the NE

I-373-008

Your preference for stations at NE 130th and NE 155th Streets is noted.

I-373-008 145th location offers almost no Transit-Oriented-Development potential, with three out the four surrounding quadrants (highway, highway, golf course) unable to be developed at all.

So with the answers to these first two issues (yes to 130th; choose 155th over 145th), I have fallen in line with what is described in the DEIS as Alternative A5 for Segment A (following my preference listed in 4.4 below for an at-grade 185th Station).

3.1.3 Question: Station at 220th SW: Yes or No?

I-373-009 The final of these three principle questions about system layout is whether or not there should be a station at 220th SW. A station located here would be a great positive to to the whole system, with increase ridership, easier access, and reduced congestion leading to the adjacent stations (Mountlake Terrace and Lynnwood P&R); so a strong "yes". One only need look at a map to see that a station at 200th SW will offer much better connections than the other station to transit traveling East/West, and also transit in the SR99 corridor. Furthermore, a station at this location provides significantly improved access for residents West of I-5 between the county line and at least 196th; AND it would serve as easy access to/from the substantial commercial and residential developments already in the area from I-5 to 76th Ave. West.

In the terms of the DEIS alternatives, by my support of the construction of the 220th Street Station I am therefore selecting Alternative B2A as representing the best choice offered for the "B" segment.

The other alternatives to be discussed concern specific station sites: precise location, alignment, and elevation. I will comment on those individually below (section 4) as I discuss the stations separately; but for the record, in Segment "C" I prefer Alternative C1.

3.2 Strategy

I-373-010 A weakness of the Lynnwood Link Extension as currently presented in the DEIS is the attempt to meet every need at every station – which will lead to to congestion of all movement and negatively impact the station-areas. (this planning falls into the trap: "Jack-of-All-Trades; Master of None.") Just as I can accept that every station site will not be perfect for Transit-Oriented-Development; Sound Transit should not insist on extensive vehicle AND transit access at every station location. Planning should designate the focus and goals of each station, and concentrate on those uses at each locations.

The most significant difference in uses is between individual vehicles vs. transit. Both the cars coming to park at a station, and the transit (principally buses) stopping for riders to make connections are going to congest the station area. At a broad, spread out location (e.g. SeaTac Airport), both can and will coexist. But some of the station sites along the Lynnwood Link are already cramped, they have a small number of adjacent arterials, and they have limited street connections to the surrounding communities. This is not simply a conflict of different vehicles (bus vs. car) on the road – buses make stops, take up more of the road, and let off passengers who

I-373-009

Your comment stating your preference for a light rail transit station at 220th Street SW, as included in Alternative B2A, is noted. Sound Transit also acknowledges your preference for Alternative C1.

I-373-010

Your comments about station planning are noted. For the Lynnwood Link Extension, Sound Transit is designing the stations to accommodate pedestrians, bicyclists, bus transit riders and vehicles, as the station site allows. Note that the NE 130th Street stations would have limited or no parking due to site constraints. Each station is designed with its site location in mind.

I-373-010 then become pedestrians in crosswalks. All of this cause public safety issues and can slow down car traffic, which in turn can clog up intersections and roadways limiting the bus's ability to stay on schedule and make their connections.

I-373-011 It is true that these are public streets, and everyone is welcome to use whatever station they wish. But Sound Transit, along with its partner agencies and municipalities can manage and moderate some of this conflict, segregating differing uses to some locations but not others. Transit /buses can easily be controlled through the design of routes and schedules; and the amount of cars typically using a station can be limited by the amount of parking available. If parking is limited, so is car traffic at and near a station.

Looking at "the whole" of the Light Rail system from Northgate to Lynnwood, there already exists (or is planned) extensive commuter parking at Northgate, Mountlake Terrace, and the Lynnwood Transit Center. Parking could therefore be evenly distributed by only adding a significant parking structure at 145th/155th.

This creates a pattern of every-other-station focusing on park & ride commuters vs. bus-riding transfers as shown in the following chart:

Northgate	–	significant parking	and	transit connections
NE 130th	–			transit connections
NE 145th/155th	–	significant parking		
NE 185th	–			transit connections
Mountlake Terrace	–	significant parking	and	transit connections
220th SW	–			transit connections
Lynnwood	–	significant parking	and	transit connections

This pattern also falls in line with my comments above (section 1) regarding the 185th station's need to be better focused on connecting to transit on SR104; and also my comments (section 3.1.2) that the current congestion near NE 145th makes transit movement through this area problematic.

So I suggest that a new parking structure ONLY be built at a 145th/155th station, and do not build them –or at least greatly reduce them– at 130th, 185th, and 220th. Likewise, in turn, concentrate the efforts of designing for and accommodating transit connections at those same stations but accept that those efforts can be minimized at 145th/155th.

I-373-011

Your comments regarding the location of station parking along the Lynnwood Link Extension are noted. Sound Transit currently plans to include parking at all the Preferred Alternative stations; see Chapter 2 of the Final EIS.

Section 4: PLAN & DESIGN DETAILS – STATION by STATION

4.1: NE 130th Street Station

I-373-012

-----As discussed in Section 3.1.1 above, the inclusion of the 130th street station seems vital to the Light Rail system north of Northgate. Without it, everyone to the NE, and especially everyone to the NW from about 100th to 140th will need to make their way (by car, bus, bike, or foot) through all of the congestion at Northgate to get to the station south of the mall. This would mean so much frustration that fewer people will use the system.

-----I strongly support Option #1, with the less-disruptive at-grade station and no significant additional parking created (see 3.2 above).

-----Enhance potential TOD development at 130th by designing to allow station "overbuild" to provide commercial and/or community space above the station. Besides allowing the best possible integration of the station with the local community, this would help shield the neighborhood from the sights and sounds of the highway and light rail.

-----Shift the station (shown in Option 1), which has its rail alignment pass under the NE 130th Street bridge, towards the south approximately 150 feet, "spanning under" the bridge. This would create a direct connection from eastbound buses to the station rather than forcing people transferring to cross the arterial on foot. This would also decrease the amount of vehicles and bicycles making left turns onto 5th to get to the station; and significantly reduce the number people needing to use the crosswalk across NE 130th Street - a busy arterial that will become more congested with the opening of the station. [Note that this strategy of "spanning" the adjacent east/west arterial is shown in the DEIS at the proposed 155th , 236th, and 220th stations].

4.2: NE 145th Street Station

I-373-013

As discussed above in Section 3.1.2, locating a station at 155th rather than 145th makes much more sense. Beyond that, 145th is just basically a lousy site for a station — no adjacent land available for TOD in 3 out of the 4 surrounding quadrants (hwy, hwy, golf course); AND the location is already a choke-point with bad congestion in all directions. Bringing hundreds more cars, bus connections, bike riders, and pedestrians to this location every day would seem to be a recipe for public-safety issues and grid-lock.

If, regardless of these factor, Sound Transit still chooses to build a station at NE 145th Street, the following issues should be noted;

-----Of the 2 options for the 145th Street Station shown in the DEIS, Option #2 is preferable, with its smaller footprint having less of a negative impact on the surrounding land and therefore allowing for more potential TOD.

-----The elevated station shown in Option #2 should however be shifted to the south (approximately 200 feet?) to "span" NE 145th much as the elevated stations shown in the DEIS at 155th, 236th, and 220th are

I-373-012

Your comments in support of the NE 130th Street Station and on its design are noted. Alternatives that include the NE 130th Street Station may draw some demand away from Northgate. Such a configuration adds travel time and delay to riders from north of that point. With the station locations, Sound Transit attempted to achieve many objectives, one of which is to balance the need to provide regional high capacity, high speed travel and local access. Although it does not include a station at NE 130th Street, the Preferred Alternative has an option to consider a 130th Street Station.

The suggested design option to shift the station was explored, but it would have more operational, construction, and cost impacts upstream and downstream of NE 130th Street.

I-373-013

Your comments regarding the NE 145th Street Station are noted. Section 3.2.4 of the Final EIS discusses traffic operations at that location. Your suggestion for shifting the station south to span NE 145th Street was not advanced because it increased constructability risks without improving access or operations, as the area to the south has no populated adjacent areas.

I-373-013 sited. As noted above in the comments to the NE130th location, this creates a direct connection from eastbound buses to the station rather than people needing to cross the arterial, and also also decreases the amount of vehicles and bicycles making left turns onto 5th to get to the station. This is already an incredibly congested intersection, and introduction of hundreds more vehicle left-turns AND hundreds more pedestrians in the crosswalks sounds like a nightmare.

I-373-014 -----If the construction of this station goes forward, along with the reconstruction of portions of the highway ramps, this opportunity should be exploited to also reconfigure the express transit "flyer stops". Currently, express buses need to 'weave' from the inside car pool / transit lane to the outside of the highway lanes at NE 145th Street. This is dangerous, inefficient, and slows down traffic and the express buses At first glance, it almost seems like the arrival of Light Rail along I-5 will make these express-bus routes and "flyer stops" obsolete - but there are many people who will still want and need to transfer between these two systems, especially in the decades prior to the completion of Link to Everett. Therefore, Sound Transit should work with its partner agencies (WashDOT, King County Metro, etc.) to redesign this entire interchange to allow for express-lane flyer-stops, AND plan a connection of the light rail station directly to/from these flyer stops with a pedestrian bridge or a similar feature.

I-373-015 -----Enhance potential TOD at NE 145th Street by designing to allow station "overbuild/underbuild" and incorporating space into the parking structure to provide commercial and/or community space. This would help increase the potential for TOD from the current VERY limited status, and allow the best possible integration of the station with the local neighborhood.

4.3 NE 155th Street Station

I-373-016 As mentioned in Section 3.1.2 above, locating a station at here at 155th rather than 145th makes much more sense. From a purely arithmetic / theoretical /strategic standpoint, a station at 155th better divides the 55 blocks between 130th and 185th. Moreover, it actually provides a higher potential for TOD and better connections to other transit due to the lower amount of surface congestion at this spot. Issues that should be considered for a station at this site include:

-----There are no alternate station options listed at this site, but let me call attention to, and strongly support its layout /design "spanning" the adjacent east-west arterial – something which should also be done for the designs at 130th, 145th, and 185th. Better transit connections, less public safety issues, fewer negative impacts on surface congestion.

-----This site needs better transit connections for local North-South buses A transit-only "back gate" south out of the site should be designed which connects into 152nd or 153rd to allow buses on 5th NE to make a loop off that arterial to connect to the station.

----- "Surrounding" the fire station with a transit station and parking structure seems like a bad idea, and one in which both parties (Sound Transit and Fire Department) will negatively impact the other. Sound Transit must work with the Fire Department to re-locate and rebuild this station away from this site.

I-373-014

The transit ramps at 145th are anticipated to be decommissioned as part of this project. A pedestrian and bicycle connection from NE 145th Street to the station will be provided.

I-373-015

Overbuilding of a station or parking garage to provide development opportunities is a complex issue. As you mentioned, it is included in Sound Transit's TOD Policy, and Sound Transit will consider a joint development project if a number of conditions are met. Currently, there is no plan for joint development at the Lynnwood Link Extension stations, but Sound Transit will continue to investigate possibilities in coordination with local jurisdictions and other agencies.

I-373-016

Your comments about the NE 155th Street Station are noted. It is not included in the Final EIS Preferred Alternative.

Section 4.14 addresses possible impacts of a station at NE 155th Street on the operations of the fire station. If selected as the alternative to be built, Sound Transit would work closely with the Fire Department to resolve potential conflicts with bus and vehicle traffic to maintain emergency response times during the construction period and operation of light rail.

See response to I-373-07 above.

I-373-016 -----Enhance potential TOD development at NE 155th Street by designing to allow station "overbuild/underbuild" and incorporating space into the parking structure to provide commercial and/or community space. This would help increase the potential for TOD at this site; would allow the best possible integration of the station with the local community, this would help shield the surrounding neighborhood from the sights and sounds of the highway and light rail.

4.4 NE 185th Street Station

I-373-017 As mentioned above in Sections 1 and 3.2, this station will be situated where transit connections are VITAL, but also very challenging. Therefore, a prioritization of connectivity, public safety, and Transit-Oriented-Development is essential. Specific issues include:

-----The at-grade train tracks and center platform design shown in Option #1 is vastly preferable to the elevated station shown in the DEIS, and this choice is supported by the vast majority of the public input collected from area residents.

-----As discussed elsewhere, and shown in the DEIS for the 155th, 236th, and 220th stations; the 185th Street Station should be shifted towards the south approximately 150 feet, "spanning under" the 185th St Bridge so eastbound bus, pedestrian, and bicycle traffic on NE 185th Street can access the station directly. This would decrease the amount of vehicles making left turns off the arterial, and significantly reduce the number people needing to use the crosswalk across NE 185th St - a busy arterial that will become more congested with the opening of the station.

-----Transit access loop turning into the station from 8th Ave NE and exiting the station via NE 185th St (as shown in Option 1) should be aligned with the "reconstructed" 5th Avenue East" (also shown in Option #1). Currently in the drawings the southbound lanes out of the station are aligned head-to-head with the northbound 5th Avenue traffic. Furthermore, this resulting intersection should be provided with a traffic light.

-----As mentioned in Section 3.2 above, it will make for a better strategy to focus the 185th station of transit connections and NOT commuter park & ride passengers; so therefore NO significant parking or parking structures should be added at this location. HOWEVER, if Sound Transit insists on constructing additional parking, a structure located on the West side of I-5 along NE 185th St (as shown in Option 1) is the preferable option since it would have the least negative impact on the station area, and have the beneficial effect of helping with the challenges of parking during events at the adjacent school district facilities.

-----Reconfigure the station site (as shown in Option 1) to maximize potential Transit-Oriented-Development immediately adjacent to the station. Currently the design shows a great deal of the land immediately adjacent to the station taken up with bioretention cells, service vehicle parking & ancillary buildings, and a large (.75 acre) blank "Landscaped Area". These areas represent the absolute best sites for TOD and should not be used for non-public infrastructure or overly large, non-supportive open space. The station, and station area, would be much better served by the inclusion of a smaller town-square type public area as an open-space and a focus for TOD.

I-373-017

Your design strategies for the NE 185th Street Station are noted. Appendix F of the Final EIS contains current design drawings for this station, as well as the others proposed for the Preferred Alternative. The design of this station has been modified since the Draft EIS, including transit ingress and egress on NE 185th Street and relocated infiltration ponds. Parking at this station is proposed in a new garage on the west side of I-5 under the Preferred Alternative. The suggestion to shift the station south was not advanced because it would increase construction impacts without improving access or operations.

Please see response to I -373-07.

I-373-017 -----Further enhance potential TOD development by designing for, and allowing station "overbuild" to provide commercial and/or community space above the station. Besides fostering the best possible integration of the station with local businesses, this would further shield the adjacent neighborhood and planned open spaces from the sights and sounds of the highway and light rail.

4.5 Mountlake Terrace

I-373-018 For the sake of transit connectivity (see section #1 above), potential Transit-Oriented-Development (see section #2 above), and the preservation of existing express transit (again, section #1 above) the Station at the Mountlake Terrace Transit Center should be constructed as shown in the design for Alternatives B1, B2, B2A – Spanning across 236th Street SW. This alignment and layout works to streamline transit connections and minimize surface congestion impacts, while also opening up a broader area of adjacent land for potential TOD. The alternative, displacing the Express Bus "flyer stop" in the center of the highway, is a very bad idea. While at first glance, it almost seems like the arrival of Light Rail along I-5 will make these express-bus routes and "flyer stops" obsolete, this is certainly NOT true. There are many people who will still want and need to ride on express buses on the highway – and transfer between these two systems – especially in the decades prior to the completion of Link to Everett.

Other details which should be considered for the Mountlake Terrace Station include:

-----Design and build a direct pedestrian connection from the Light Rail Station to the neighboring "flyer stop". Currently the drawings (Alternatives B1, B2, B2A) show no such link even though they are both elevated stations at the same site.

-----Increase the potential for TOD adjacent to this transit center by designing to allow station "overbuild/underbuild" and incorporating space into the structures which provide commercial and/or community space. This would help increase the potential for TOD within this important station-area, allow the best possible integration of the station with the local neighborhood, and help shield the community from the sights and sounds of the highway and light rail.

4.6 220th SW Street Station

I-373-019 As discussed above in Section 3.1.3, there should positively be a station at this location. It would be an asset to to the whole system, with increase ridership, easier access, and reduced congestion leading to the adjacent stations (Mountlake Terrace and Lynnwood P&R). One only need look at a map to see that a station at 200th SW will offer much better connections than the other stations to transit traveling East/West, and also transit in the SR99 corridor. Furthermore, a station at this location provides significantly improved access for residents west of I-5 between the county line and at least 196th; AND it would serve as easy access to/from the substantial commercial and residential developments already in the area from I-5 to 76th Avenue W.

I-373-018

The Preferred Alternative evaluated in the Final EIS locates the light rail station over 236th Street SW. The freeway flyer stop is currently connected by a pedestrian walkway to the existing Mountlake Terrace Transit Center parking garage. This connection would remain, and a new one would not be built.

All alternatives except Alternative B4 would allow the freeway station to be used longer term, although the long term use depends on transit-integration decisions yet to be made by the transit operators (Community Transit, Sound Transit, and Metro) currently serving the station.

Please see response to comment I-373-007 regarding TOD.

I-373-019

Alternative options to provide for a future station at 220th Street SW are considered in the Final EIS.

I-373-019 There are no alternatives or separate options listed for a 220th SW station in the DEIS, so there is no preference to be stated here, other that to repeat the this station should definitely be included as part of the project. Also, its current design "spanning" 220th, is something which is a great asset and should be supported as I have mentioned with the other stations (stations shown at 236th and 155th are designed this way – stations at 130th, 145th, and 185th and not, BUT SHOULD BE).

I-373-020 ----As has been mentioned with the other stations, TOD potential should be increased at this station site by designing to allow "overbuild/underbuild" and incorporating areas into the structures which provide commercial and/or community space. This would help increase the potential for TOD within this station-area, allow better integration of the station with the local area, and help shield the community from the sights and sounds of the highway and light rail.

I-373-021 -----The other comment I'd make to the design of the 220th Street Station is that the Parking Structure shown should NOT be built. As discussed in Section 3.2 above, there will already be significant park & ride capacity at two nearby stations (Lynnwood and Mountlake Terrace Transit Centers), and a station at 220th SW would better serve the community with a strong focus on transit connections, NOT as a park & ride facility.

4.6 Lynnwood Transit Center

I-373-022 Given the importance and value of Transit-Oriented-Development (see Section 2 above), and its ability to help support the Link Light Rail System, Alternate C1 appears to be the best option. It provides a station furthest away from the highway, so it has the most land which could potentially be developed as TOD, and those developments would be more attractive since they would not be immediately adjacent to the highway.

So this is a great start, but other factors to consider include:

-----Further increase the potential for TOD,and really maximizing the station's integration into the community by designing station "overbuild/underbuild" and incorporating spaces into the adjacent structures which provide commercial and/or community space.

-----Remember that rider's experiences at stations are as important to a transit system's success. Because of this, make certain that the issue of transit transfers are prioritized, included into the planning, and that the station's design incorporates features that streamline connections and make waiting and transferring safe, easy, comfortable. Considering DEIS design C1, this should mean that the station has a mezzanine level with an elevated and covered pedestrian walkway connecting into the adjacent parking garage, and then on across over to the center of the Bus Transit Center where pedestrians could descend to the platform. This would speed up access into and out of the Light Rail Station, and by grade-separating pedestrians from surface traffic public safety will be enhanced and transit delays minimized.

I-373-020

Please refer to I-373-007.

I-373-021

If built, parking is proposed at the 220th Street SW Station.

I-373-022

Your preference for Alternative C1, and your design suggestions for the transit center are noted. Alternative C1 is not included in the Final EIS Preferred Alternative. See Appendix F for the current design proposed for this station with the Preferred Alternative. Please refer to the response to I-373-007.

Thank you for your summary of preferences for the Lynnwood Link Extension.

SUMMARY:

I-373-022

In the terms of the DEIS alternatives listed I support an Lynnwood Link Extension which would be described as: Alternative A5; Alternative B2A; Alternative C1.

Beyond those choices as listed in the DEIS, significant changes to what is listed in the DEIS should include (all the details as to "why" I make these comments can be found in the preceding sections as indicated):

1. Alter designs at every station to increase the potential for Transit-Oriented-Development. This includes: allowing for over/under build of station itself; moving and minimizing the presence of non-vital systems and facilities away from the station core; reduce the amount of parking; foster the creation of community "hubs" at each station to anchor and support the development of each Station Area. (see Section 2; Section 4.1 through 4.6)

2. The current design of some stations (155th, 236th, 220th) "spanning" the adjacent east—west arterial, is a great feature which all of the station designs (130th, 145th, 185th) should also emulate. As discussed: it increases public safety, will mitigate some of the negative impact the stations will have on surface congestion in the station-areas, and will streamline and make more pleasant rider's experiences accessing and transferring at the stations. (see Sections 4.1 through 4.6)

3. The only significant parking structure which should be constructed as part of this project would be the garage at NE 155th Street. (see Section 3.2)

4. Much more attention must be given to this Light Rail line's connectivity to the current and future transit system must be much better studied; and efforts must be made to design and plan efficient and effective transfers to/from the Lynnwood Link. (see Section 1; Section 4.1 through 4.6)

CONCLUSIONS:

I-373-023

Reading the Lynnwood Link DIES it unfortunately looks like the communities and neighborhoods to the north of Northgate are being asked to accommodate a series of large Park & Ride facilities for a commuter railroad. The residential densities are slightly lower than in downtown Seattle, but this area is all a part of the same continuous metropolitan area — an area ready to be served by this intra-urban transit system which will in turn support urban growth and increasing density.

I don't know if the designs in the DEIS fall short because of perceived potential cost pressures, or just a notion that it would be more expedient to simply focus on the needs of commuters rather that to plan a system which integrates with each community it serves. No doubt, one goal of Sound Transit's Light Rail system is to meet the needs of commuters, but this is not its only use, nor the only goal identified by Sound Transit's Board. Each station needs to support its immediate community, and foster the TOD that will in turn help support the station and the whole system.

Last April, Sound Transit's own analysis reported that the potential for TOD at the proposed Lynnwood Link station sites to be poor. Unfortunately, in the intervening 4 months between doing this research and issuing the DEIS in July it appears that little or nothing changed – there was no recognition that the current design was not meeting Sound Transit's own Transit-Oriented-Development criteria (ST Policies issued December 2012). This is frustrating, because even though this route will always be greatly limited by its alignment down the edge of the highway, the designs of the stations can be modified to better mitigate the negative impacts and integrate into the neighborhoods – and that in turn will better support Station-Area-Plans in each community.

Jumping all the way back to my very first line of these comments, please remember that I am a huge fan and advocate for Public Transit. My comments, complaints, and suggestions here do not represent someone fighting against the construction of Light Rail – just the opposite. I want all these transit systems built, and then more! But I watch and see just how costly these plans and developments are, and how long it takes to complete – and that leaves me with the unmistakable impression that we've only got a single chance to create these systems (in our lifetimes anyway), so we better all do the best we can at "Getting it Right the First Time".

So I take part in the public process, and send in these comments, in hopes that we don't just build the quickest, easiest, most expedient solution which satisfies the broad goal (in this case, getting Light Rail to Lynnwood) – but instead takes the time to figure out creative solutions which maximize the value and guarantees the worth of every aspect of what Sound Transit creates.

It is what our neighborhoods, communities, and the entire region demands and deserves. I hope that Sound Transit takes the time to plan and implement a design which results in truly great stations, supporting vibrant station areas in transit-oriented neighborhood, all of which is vital for our regional transit system to succeed.

Regards--

Andrew Reay-Ellers

I-373-023

Thank you for your comments and concerns. Sound Transit appreciates your time and input in the public process.

Sound Transit refined the project design for the Preferred Alternative in the Final EIS; see Appendix F for conceptual designs.

Sound Transit
Draft EIS Comments, c/o Lauren Swift
401 South Jackson Street
Seattle, WA 98104
LynnwoodLinkDEIS@soundtransit.org

Dear Members of the Sound Transit Board –

I-374-001 I am writing to express my concerns over the planned light rail extension to Lynnwood, and specifically how this project is going to impact our Latvian community's church and cultural center.

Our center is of significant historical importance to me, my family and the rest of the Latvian and Baltic communities. The "christening" of the church took place on February 6th, 1972. I was born just a few weeks later on March 16th, 1972, and soon after was one of the first children christened in our church (see pics below signature). I have been an active member of the Seattle Latvian-American community since early childhood, and attended the Seattle Latvian School on Saturdays.

Over the last few decades, we have also enjoyed countless events at the center, from the beautiful Christmas Eve church service to dances, choir performances, bazaars, birthday parties, weddings, confirmations and the like. Now I have a family of my own, and all three of my children were christened in the very church I was 40+ years ago. My three kids are also following in the footsteps of my generation by attending the Latvian School and enjoying all the same dynamic functions. At school, the kids learn all about the Latvian language, history, folklore, traditional dancing and singing. But they also have the unique opportunity to share their very own Latvian family history with friends.

My parents fled Latvia on foot during World War II, and after a few years in Displaced Persons camps in Germany, immigrated to the United States. After the original Latvian Center in Wallingford was claimed by eminent domain, my Mom and Dad were part of the crew who hand-built the center near 117th Street and 3rd Avenue, next to I-5. Specifically, my parents were largely responsible for the interior design elements of the building, most of which is still in place after all this time. Relocating our center would not just destroy the physical structure built by our original Seattle Latvian community members, but it would also end the decades of fond memories for 3 generations of families.

I-374-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you, the region's Latvian community, and the larger Baltic community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-374-001 Our center is living, breathing history. It simply cannot be replaced by an alternative property. The loss to our Baltic community would be completely devastating.

Although there are challenges the board faces with the potential light rail routes, it is imperative that our center face minimal impact from the Sound Transit expansion to Lynnwood, both during construction and after completion. I sincerely hope that a route can be established that would allow for light rail to be constructed at grade to help minimize or eliminate the noise and vibration caused by the frequently passing trains. From the peaceful services and ceremonies in the church to traditional Latvian performances in the hall, adding these unwanted elements would permanently alter our enjoyment of the center. The center is the hub of our active and vibrant Latvian community, and even short-term closure would have an adverse effect on our families.

Elimination of the Latvian church and cultural center for Sound Transit expansion simply should not be considered in your construction plans. Please consider a route that would have the least impact on our community center.

Respectfully,

Pauls Zommers (and Family: wife Julie, daughters Laila and Anna, son Aleksandrs)

LEFT: My mother Dzintra Zommers holding me tight after my christening in 1972. We are joined by Minister Ābolinš with my Dad and Godparents close behind.

RIGHT: Four decades later! My son Aleksandrs (youngest of our 3 kids) after his christening in 2011. Minister Cilnis and parents Pauls and Julie are book-ended by Aleks' Godparents.

September 23, 2013

To: Sound Transit - Attention Joni Earl and Board Members

From: Ed Paskovskis, 2905 25th Ave West Seattle, WA 98199

Regarding: Lynnwood Link Extension Draft EIS

Thank-you for the opportunity to comment of the proposed Lynnwood Link Extension project.

I-375-001

I urge the Sound Transit Board to find an alternative route for the above mentioned Link Extension. Under the current Draft EIS proposal the Latvian Church and Community Center (LCCC) will be threatened in its ability to serve its stakeholder communities during construction and implementation. Specifically, my Baltic-American family of three generations has used these facilities since the 1960's. We are genuinely concerned that the Lynnwood Link Extension will adversely affect the religious, historical and cultural traditions this location has offered the Baltic-American Community of Puget Sound.

The property upon which the LCCC is situated upon is a vision realized by scores of Baltic-Americans, many of whom immigrated to this country after the occupation of the Baltic States, Estonia, Latvia and Lithuania by the Soviet Union in 1944. Since the 1960's this parcel of land has been a symbol of freedom to exercise religious, cultural and community traditions. The property is most unique in that is provides a private sanctuary under evergreen trees in an urban setting. Needless to say, the privacy aspect of this property may be impaired by this project proposal.

Please respond the following concerns in the EIS:

1) What project location alternatives are available that do not result in any property takings from the LCCC?

2) If LCCC property takings are warranted during construction and/or implementation what alternative sites are within proximity?

3) What if any impact will be generated by additional noise reflecting to the LCCC?

4) What if any impact will be generated by additional lighting reflecting to the LCCC?

5) What if any impact will be generated by vibration to the LCCC?.

6) Is there any data to indicate similar projects generate crime in the neighboring areas?

We look forward to Sound Transit's response.

I-375-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the edge of the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describing the acquisition impacts; Section 4.4 describing impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including portions of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

The EIS discusses noise and vibration impacts in Section 4.7, visual and aesthetic impacts in Section 4.5, and safety in Section 4.14.

Sound Transit
DEIS Comments c/o Lauren Swift
401 Jackson St.
Seattle, WA 98104

I-376-001

I am writing to voice my concerns over the current preferred designs that staff have presented to the board, specific to the section adjacent to the Latvian Church located at 11710 3rd Ave NE Seattle WA. I am a member of the congregation and sit on the board of directors of the community center.

My parents were both born in Latvia, immigrated to the United Sates after WWII and settled in Sacramento California where they raised their family. My brother, sisters and I were caught the Latvian language from an early age at home, as well as attending Latvian school on Saturdays, where we were taught the language, history, songs, dance and culture of the Latvian people. Just like here in Seattle, Sacramento had a Latvian Lutheran church, school and a community center where we all came together to share not only or religious beliefs, but the language and culture of Latvia.

I left Sacramento in 1980 to find my way in the world and eventually got married and started my own family. We moved to Seattle in 1989 and started our family with our first born in 1993 and 3 years later our second son was born. Both my sons have attend and graduated from the Seattle Latvian school. Have attend church there and participated in many events over the years. Both sons have traveled to Latvia through a program called "Sveiks Latvia" which is sponsored by the Latvian government as well as the American Latvian Association of America in conjunction with the local Latvian schools here in the United States and other countries around the world. My oldest son is a member of the local Latvian dance group "Trejdeksnitis" and has performed at many events with them.

My point is, that this church/community center has been a huge part of my family's life here in Seattle and I don't know how I could exposed my sons and family to my rich heritage that my parents exposed me to. They will both be better men and people with this experience and hope that they will be able to share it with their families when that time comes.

My family and I are not against the light rail being expanded throughout this area, but we are against it encroaching on the church/community centers property. Please take the time to design the rail, so that it does not affect the property in any way, so it can continue to prosper and provide experiences for my children and their children in the future.

Sincerely:

Edmunds Lettis

I-376-001

Draft EIS Comments

September 23, 2013

From Mary Monaghan
5214 - 201st Pl S.W.
Lynnwood, WA 98036

I-377-001 I spoke at the Embassy Suites in Lynnwood, WA on August 21, 2013 but did not have time to address the errors on the DEIS. There is mislabeling on attachment F on maps of noise wall mitigation – Locations – 200th St is mislabeled 196th for pages on C1, C2 and C3.

I-377-002 Attachment D – Vibration Impact by Build Alternative Table D-3 Projected Vibraation for Segment C without mitigation - The distance to nearest track (ft) is incorrect on C2M and C3M and C2W and 3W – We live on 5214 – 201st Pl S.W. in Lynnwood and they have us closer to C3 than C2 and we are closer to C1 and C2. They all seem to be switched around on all addresses or at least in our neighborhood and on 52nd.

I-377-003 Under Character and Cohesion changes – Both C1 and C2 would feature design measures to avoid noise impacts, but the elevated guideways would change views and Alternative C3 would have the least effect on this neighborhood because it is largely adjacent or parallel to 1-5. Table 4.5-1 Visual Quality Impacts – page 4-81 – High visual impacts for C1 and C2. Elevated guideways on east side of 52nd Ave. W would visually intrude upon the integrity and unity of the residential area.
P. 4-82 We on 201st Pl. S.W. down by the Spragues Ponds and mini park will be impacted visually by the skyline and loss of mature old growth vegetation and trees. On page S-32 under S.10 you talk of longer term visual impacts that might not be mitigated. Does this mean if you destroy a park and wetlands, you cannot or will not mitigate and put the wetlands back together or it may take a hundred years for things to grow back? There is no way ST can give back all of this old growth vegetation and trees after construction which are a buffer to freeway noise now.

I-377-004 The bogs and wetlands are a natural filtration ecosystem which work hand in hand and should not be messed with. We need this natural filtration in our community because of the transit center where many busses and vehicles come into and also when the Edmonds School District build there buss barn facility, there will be even more need for these wetlands and bogs to help keep the air clean. If you disrupt this delicate balance, it could be disastrous to our air quality, wildlife, animals, fish, birds and even bees. A quote from Albert Einstein "If the bee disappeared off the face of the earth, man would only have four years left to live." If the human race continues to destroy our precious wetlands and bogs, this could very well contribute to our demise.

I-377-005 I feel the light rail should use the new alternative C3M and stay in the middle of the freeway as long as possible and then cross over to the transit center.
I

I-377-001
We reviewed the maps showing noise and vibration impacts to make sure they show the correct parcels with impacts.

I-377-002
A labeling error occurred which resulted in a portion of Alternative C2 to be switched with a portion of Alternative C3 during the vibration analysis (from Civil Station 522+00 to the north end of the alignment). This error had no effect on the conclusion that vibration mitigation was not required for receivers along that segment of the alignment. The correct distances are used for all receivers in the Final EIS and the correct vibration levels are reported.

I-377-003
Your concerns about visual impacts related to the elevated guideway are noted. Sound Transit will mitigate impacts to parks and wetlands, but if mature trees must be removed, it will take time for the replanted trees to grow in. It is this potential impact that the text in the Summary is acknowledging. Modified Alternative C3 is the Preferred Alternative in the Final EIS, which avoids impacts to Scriber Creek Park and reduces wetland impacts compared to some other alternatives.

I-377-004
Your comments regarding the importance of wetlands are noted. Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts on environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure no net loss of ecosystem function and acreage as a result of agency projects.

I-377-005
Your preference for modified Alternative C3 is noted.

Re: Comment on the Sound Transit Lynwood Link Extension Draft Environmental Impact Statement Dated July 26, 2013, (the "DEIS")

To Whom It May Concern:

I-378-001 I have reviewed the DEIS and I have several comments regarding the impacts on the various alternative routes would have on the Latvian church and community center located at 11710 3rd Ave NE, Seattle, WA 98125. By way of background, my personal use of the Latvian Center includes among other things: my christening, ten years of Latvian school on Saturdays, Latvian folk dancing for six years, and countless social and cultural events while I attended the University of Washington's Baltic studies Program. Now that I have a family of my own, my daughters attend the Latvian School on Saturdays and we attend many of the other events at the Latvian Center including performances, shows, and the candle light services. I anticipate that my daughters will be at the school for the next ten years or longer, and participate in the same events I was lucky enough to experience at the Latvian Center. I cannot imagine raising my family without the Latvian Center and the cultural events that occur there.

Comments on Impacts of Elevated Routes

The DEIS does not clearly define exactly where the elevated alternatives will run in relation to the Latvian Center. I urge Sound Transit to review an alignment of the elevated tracks that keeps them as far away from the Latvian Center as possible. To the extent the caretaker's house must be taken, I urge Sound Transit to compensate sufficiently to replace the caretaker's house with another house on one of the properties adjacent to the Latvian Center. Without a caretaker's house, the center would be

I-378-002 susceptible to criminal activity due to its isolation. The DEIS fails to outline specific noise mitigation to the Latvian Center. It should review noise impacts and mitigation

I-378-001

Thank you for describing the importance of the Latvian Church and community center to you and your family.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the edge of the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property as shown in Appendix F of the Draft and Final EIS.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describing the acquisition impacts; Section 4.4 describing impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations. As noted in Section 4.1, any acquisition of property, including portions of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

I-378-002

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below these criteria. Potential mitigation measures for noise impacts are described in Section 4.7.7 of the Final EIS.

I-378-002 for sound and vibration and specifically the impacts on a school playground that close to the track.

Comments on Impact of At Grade Routes

I-378-003 The DEIS calls for acquisition of the Latvian Center under all of the at grade alternatives. The DEIS should review and research alternative track alignments that do not result in taking the ingress and egress to the Latvian Center. Further, to the extent the ingress and egress must be acquired to make way for the track, the DEIS should provide a track alignment that is as far from the Latvian Center as possible to reduce noise and allow space for a noise wall. The DEIS should study noise impacts at the Latvian Center given the desire to keep the Latvian Center in its present location. Sound Transit should assist the Latvian Center with purchasing at least two adjacent properties for ingress and egress, lost parking, and a replacement of the caretaker's house. Further Sound Transit should pay for the construction and planning required to create a new ingress and egress to the Latvian Center. Anything less than this mitigation is unacceptable.

Impact on the Community of loss of cultural facility

I-378-004 In light of the above comments, the DEIS should consider the cultural impact of the loss of a Latvian school and community center to the community as a whole and to the Baltic community in Washington. At one of the public hearings for the Lynwood Link, a member of our community noted that there were over 800 families listed in the Latvian community phone book. This means that there are thousands of total Latvians in the community. In addition, the other two Baltic nations have strong communities in Seattle that use the Center. I do not know the numbers, but assuming conservatively another 300 Estonian families and 300 Lithuanian families, the Baltic community is roughly 1400 families in the state of Washington. The DEIS should consider the impact of stripping this cultural group of its community center during construction of the Lynwood Link and in the event acquisition does not cover the cost of relocation to a similar site in a similar geographic region. The DEIS does not reference these impacts, nor does it discuss the broader impact to Seattle and the Northwest of not having this cultural facility.

Sound Transit Should Avoid Acquisition/Relocation of the Latvian Center

The Center was acquired, designed, and built by donations from the members of our community. My understanding is that the previous Latvian community center was the subject of eminent domain in 1969. At that time, the funds provided by the government fell woefully short of the cost to acquire the current property and build the current Latvian Center. This scenario was unfortunate, and would be devastating if it occurred a second time. Accordingly, if at all possible, Sound Transit should cooperate with the Latvian community's leadership to plan the Lynwood Link in such a way that the Latvian Center does not have to be acquired in its entirety and relocated. The end

Draft EIS at-grade alternatives did not provide noise mitigation as the facility was assumed to be displaced. The Noise and Vibration Technical Report for the Draft EIS did include noise impacts and mitigation specific to the church. The Final EIS addresses noise impacts and mitigation for the church in the Noise and Vibration Technical Report. Attachment F shows the location of noise walls by alternative.

I-378-003

As mentioned in the response to comment I-378-001 above, the project will no longer displace the church or remove its access. Noise impacts were evaluated in the EIS in Section 4.7 and in the Noise and Vibration Technical Report.

As noted in Section 4.1, any acquisition of property, including portions of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

I-378-004

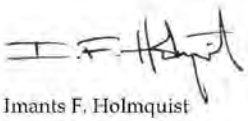
Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church, and for providing a history of how it came to be in its current location. As mentioned in the response to I-378-001, none of the Segment A alternatives avoid displace the church.

The church's importance to the community is noted in Chapter 7.

I-378-004 impact of the Lynwood Link should not be the destruction of this regionally and cultural significant community center if it can at all be avoided. The DEIS does not adequately address this impact to our community.

Thank you in advance for considering my comments. I am hopeful Sound Transit will act on these concerns and the Latvian Center will be able to continue its long and rich history in its present location.

Sincerely,



Imants F. Holmquist

Re: Sound Transit Link Light Rail system impacting the Seattle Latvian Church and Center at 11710 3rd Ave N.E, Seattle, WA 98125

I-380-001

Dear Ms. Swift,
After carefully reviewing Sound Transit's development proposal, I would like to express my deep concerns regarding the suggested plans for the Lynnwood Link Extension of the Sound Transit Link Light Rail system, along the east side of I-5. I believe the development would permanently cripple an artifact of historical and cultural significance in Northwest Seattle.

I was originally born in Latvia and moved to the U.S. for college. In 2012 after a few years of working and finishing gradschool Amazon recruited me to Seattle. A significant draw to the area versus say other opportunities in San Francisco or New York City was the vibrant Latvian community that I had heard so much about. While living so far from my native homeland, it was very important for me to preserve my cultural heritage, language and traditions.

Seattle's Latvian Church and Center did not disappoint. Quickly I got acquainted with the Center's welcoming community and became a regular member of the folk dance group Trejdeksnitis. In just over a year we have performed at numerous concerts all throughout Seattle, the group has made an international trip to the world's largest song and dance festivals in Riga and we have helped educate others about Latvian culture. And all while retaining and expanding a roster of young, committed individuals with background varying from finance to engineering, and from education to medicine for whom preserving, practicing and sharing our traditions has been immensely important.

Moreover, in the year I have been part of the Center I have seen it welcome new people to the area and helping them orient in the neighborhood. The Center fundraises and provides much needed social and material assistance to the oldest generations. Furthermore it shares its culture freely with the wider Seattle community through concerts, dinners and lectures – all events that have always been very well attended.

But the workings of this thriving place are fragile and should not be taken for granted. The people see in this physical space the work of their younger selves, their parents and grandparents. They see drapes that were sewn by their grandmothers and trees that were planted by their fathers. It is a place to honor the hardships and sacrifices that Latvian emigrants endured escaping the atrocities of WWII. This is also a place to celebrate a newly resurging independent Latvian nation. It is not just a complex of a few buildings. It's a monument to the life's work of the generations before and the generations still to come. It provides the necessary historical continuity much like other valued Seattle historic places.

Real, lasting damage will be brought by the current proposal to this vibrant cultural Seattle gem and I implore you to reconsider the plan. Please adjust your plans so as to leave this area untouched.

Sincerely,

Martins Blums
mblums@amazon.com

I-380-001

Thank you for describing the cultural importance of the Latvian Evangelical Lutheran Church and community center to you and the Latvian community.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

From: Ina Bray <inabray@comcast.net>
Sent: Saturday, September 14, 2013 4:07 PM
To: Lynnwood Link DEIS
Cc: Rimas Miksys
Subject: Save the Latvian Center!

Dear Sound Transit,

I-381-001

Your massive improvements in our area's transit connections are commendable. Yet the impact on the Latvian Center, the Latvian Lutheran Church and the Latvian *and* Baltic Communities could be devastating.

As you know, the land was purchased and these structures were built because of the intense dedication to their ethnic roots of post World War II Latvian immigrants, with time attracting diligent and most responsible Latvian individuals to the Northeast neighborhood. The neighborhood grew, with the Latvian Center and all its activities as its focus.

From the mid-1970's to the early 1990's I served as the president of the *Lithuanian* Community and for us the Latvian Center was "home." That is where we celebrated, commemorated, came together for political, religious, ethnic or social reasons, strengthening our Baltic roots as well as our sense of belonging to America. Most of these activities in those days were forbidden in our home countries of Soviet Latvia, Lithuania and Estonia.

I urge you to be cognizant of the fact that major destruction of or intrusion onto the Latvian Church and the Latvian Center will have and equally major impact on all three of our communities.

If a relocation of that facility indeed would become unavoidable, the new facility cannot be established at considerable distance but needs to remain in that general North Seattle area as the central point of the community.

Sincerely,

Ina Bertulyte Bray

1

I-381-001

Thank you for describing the importance of the Latvian Evangelical Lutheran Church and the Latvian Center to you and the Latvian community.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. From: Willis Cole <colews@earthlink.net>
Sent: Sunday, September 22, 2013 10:17 AM
To: Lynnwood Link DEIS
Subject: Lynnwood Link Writtent Comment

Dear Sir/Madam:

Thank you for the opportunity to submit a comment regarding the proposals being considered for the Lynnwood Link of Sound Transit. I have closely followed the process and have attended two separate meetings in addition to email and mailed information. I submit the following:

I-382-001 It would be a mistake to rule out the options which place the Lynnwood Link Rail Station AS CLOSE AS POSSIBLE TO THE NEIGHBORHOOD (200TH AND CITY CENTER). Simply stated, light rail access will enhance the neighborhoods around the station and easy access to the City Center project will ensure its success for decades to come. Far too often, Lynnwood has place emphasis on traffic considerations rather than focusing upon its residents. Placement of the Lynnwood Link at 200th (despite the cost to relocated businesses and personal residences) will create a TRUE integration of light rail into Lynnwood. The true value and neighborhood enhancement has been realized by those neighborhoods in Portland, OR and Vancouver, BC after seeing first hand the benefits of accessibility. The City of Lynnwood and some of its citizenry have taken a shortsighted view of locating the station beyond pedestrian easy access. This is a mistake. Please consider Option 1 as the true solution for decades to come.

Please locate the maintenance facility in Lynnwood. It will ensure that the Lynnwood Link is built in a timely manner and ensure Lynnwood's importance as a business and residential center for decades.

Thank you,

Willis Cole
Owner 18020 48th Ave W Lynnwood, WA 98037

Comments

I am a Lithuanian teaches at Lithuanian Saturday Heritage school and a Visiting Lecturer at UW. I am a member of the Lithuanian – American community. We use Latvian Center a lot for all over holidays (Independence Day, Easter, Christmas, etc) and common events for Baltic Studies Program at UW. Having access to this center is very important for both - Lithuanian and Latvian communities and especially for our children – to make them familiar with our traditions and culture and to keep them for their children.

The proposed Light Rail line may have very severe impact on the Latvian Center. I am writing to ask to do everything in your power to keep access to the center open during construction. Please mitigate as much as it is possible construction impacts (vibration, noise, dust, etc)

SOUNDTRANSIT
RIDE THE WAVE

I-383-001

Thank you for describing how you and the local Lithuanian community use the Latvian Center.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Construction impacts will be mitigated as described in the applicable EIS sections: 4.6 for air quality and 4.7 for noise and vibration for example. The Center's access will be maintained during construction.

September 19, 2013

Sound Transit Draft EIS Comment
c/o Lauren Swift
401 Jackson St.
Seattle, WA 98014

I-384-001

I am a member of the Seattle Latvian Lutheran Church and the Latvian Association of the State of Washington. As a Lynnwood resident I support the Light Rail extension to Lynnwood, but I am deeply concerned about the effect the project will have on the Latvian Center, as the proposed rail line will go on our side of the freeway. As it now stands, at-grade tracks would take our entrance, our caretaker's house and part of our parking lot. There is a possibility that we might lose our Center altogether. This would be a great blow not only to the Latvian community, but to the Estonian and Lithuanian communities as well. They too use our church and community center for worship and social and cultural activities.

The Center, financed and built by members of the Latvian community, has been our "home" for more than 40 years. Both my father and brother spent many hours after work and on weekends helping with the construction. People of all generations use the Center: children attend the Latvian Saturday School, young people practice folk-dancing, sing in the choir, seniors meet for lunch and cultural programs. Much of our time away from work and duties at home is spent at the center. This month Latvia's President and the ambassador of Latvia in Washington DC will be visiting the Center. A week later we will have a visiting theater performance from Latvia. In October we have our annual Harvest Festival, in November our Christmas bazaar and Independence Day commemoration, to name a few major events. The church is used not only for services, but christenings, weddings and funerals as well. The Center is a vital part of our existence and it is hard to imagine that we could start anew at another location.

Latvian Americans who came to this country as refugees from communism are grateful to the United States for taking us in and giving us the opportunity to live in freedom. We are good citizens and have raised our children to love and respect America – after all, we are all Americans. But we also want our children to know about their roots. Please do everything possible to allow us to keep our church and center in its present location.

Sincerely yours,

Inta Wiest

Inta Wiest

Lynnwood, WA 98087-6345

I-384-001

Thank you for describing the importance of the Latvian Center to you and the Baltic communities, and for providing some history about the center.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the edge of the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describing the acquisition impacts; Section 4.4 describing impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations. As noted in Section 4.1, any acquisition of property, including portions of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

Subject: C Alternatives - for the record

Mayor Gough and Lynnwood City Council Members,

I-385-001

I spoke with Diane Bailey, the Administrator of the Conservation Futures Fund, and she told me that the Fund's records show the City of Lynnwood received funding for both Scriber Creek Watershed #1 and the Scriber Creek Wetlands Complex. She recommended that the City of Lynnwood check into how those monies were spent; specifically if there were Inter-local Agreements and Declarations of Protective Covenant for the properties funded with Conservation Futures, and to check on possible matching funds for these monies and any stipulations. (In addition, due to the naming conventions used in the City's, the Deis's and the Conservation Futures Fund's maps, I believe these funds may have been used to purchase other parcels of land impacted in the Lynnwood Link C Alternatives.)

Ms. Bailey also said to check the Title Report for the properties regarding any encumbrances which could have a significant impact on the use of these lands. Nancy Bartley, reporter, "The Seattle Times," interviewed David Somers, Council Member, Snohomish County Conservation Futures Program Advisory Board. It is my understanding he is getting an opinion from a Snohomish County attorney regarding the legal use of these properties. Also, a Field Visit to the potentially impacted lands is being scheduled by the EPA, with the FTA and Sound Transit.

I hope the Council ensures that all necessary information is obtained before making a final recommendation on the Lynnwood Link Alternatives on September 23, as there are many unanswered questions.

The future of a sensitive ecosystem, a large condominium community, many businesses, and the fate of a neighborhood rests with you. I believe Sound Transit will follow your lead and develop the route you recommend as it is easier to follow the path of least resistance. I also respectfully request that a motion be made by a council member for a Roll Call Vote so that citizens/voters know who agreed or disagreed with the City's recommended route to Sound Transit.

Thank you for your consideration,

Respectfully,
Linda Willemarck

1

I-385-001

Sound Transit has received this copy of your letter written to the City of Lynnwood City Council and Mayor, which asks for their leadership in recommending to the Sound Transit Board the project alternative that best serves the city of Lynnwood's natural environment, residents, and businesses.

The Preferred Alternative is a modified Alternative C3. If another alternative is selected requiring acquisition of property funded by the Conservation Futures Program, Sound Transit will work with the City of Lynnwood and Snohomish County to address the requirements of existing agreements.

City of Lynnwood, 20015 Cedar Valley Road, "Scriber Creek Park", Neighborhood Park / Open Space – 3.8 acres.
However, Snohomish County Assessor, Parcel 00608400300101, 20015 Cedar Valley Road, City of Lynnwood, 761 parks – general recreation, 4.59 acres.
In addition, this parcel is listed as "City of Lynnwood Scriber Creek Wetlands Park" in Backflow Prevention along Scriber Creek Attachment A-1, Scope of Work., 6/28/11.
Page 4-27 Segment C: Mountlake Terrace to Lynnwood. Alternative C1 – 50 Full Acquisitions
However, Table 4.1-1 Potential property acquisition and displacement C1 total full acquisitions – 80
Table 4.2-2 Estimated area of acreage by land use. C1 multifamily lists .83 acres.
However, The 76 Multifamily units are over 3.0 acres alone.
Table 4.17-5 Potential Construction Impacts on Scriber Creek Park. "Short-term partial closure of the park during construction." *THIS IS THE ONLY NOTATION.*
However, the C2 and C3 categories note noise and visual impacts, *yet not in C1.*
Table 4.8-1 Streams in study area, Coho Salmon and Cutthroat Trout noted. See figure 3.1c in the DEIS.
OMSF Site Evaluation October 2012, City of Lynnwood: The City was also concerned about the sites proximity and potential impacts to the Interurban Trail (linear park on the south side) and Scriber Creek (salmonid bearing waterway north of the site) and potential loss of flood storage capacity.
However, (Summary) S-20 No adverse impacts on threatened or endangered species. ...in seismically active area therefore, localized geological hazards and risks are possible.
City of Lynnwood, Chapter 17.10, Environmentally Critical Areas: 17.10.060 Stream – Rating.
A. Category I. The following streams are classified as **Category I: Scriber Creek**, Swamp Creek, Lunds Creek and Halls Creek. The Sensitive Areas Ordinance requires buffers from the nearest development.
However, 17.10.062 Stream alteration allowed.
A. All Category I streams shall be preserved. The city may only allow alteration of Category I streams when approved under LMC 17.10.048 and 17.10.049.
A. An application for a reasonable use exception containing the elements required in LMC 17.10.049 shall be filed with the department and shall be considered by the hearing examiner at a public hearing under Process I (LMC 1.35.100 through 1.35.180).

I-386-001

The Lynnwood Link Extension will comply with all federal, state, and local environmental laws and regulations to avoid and minimize impacts on ecosystems resources, as discussed in Section 4.8 of the EIS. Also, as noted in Section 4.8, the study area for ecosystems was defined as the area within 200 feet of the project alternatives and features to capture potential impacts on regulatory buffers for wetlands and water bodies.

Table 4.2-2 identifies the estimated acreage of land permanently converted to a transportation use; in some cases, a larger parcel could be impacted and its use displaced, but not all of that parcel would be likely to remain as a transportation use.

I-386-001

S-20 Water resources – the Segment C alternatives could place structures in the Scriber Creek Floodplain.
However, S-31 C1 would have columns and a section of the elevated guideway within the Park

Native Growth Protection Area. Sign Installation Guidelines Sign placement shall be up to the approval of Snohomish County. All signs must be secure and permanent.
However, there are at least 7 signs which our group has found on the C Alternatives property. One sign is only 50 feet away from 52nd Ave W. With the dense wooded area it is difficult to note with any accuracy how many more signs there actually are.
Table 4.1-1 Property acquisition list includes Multifamily use.
However, Table 4.1-3 Property available for relocation has NO Multifamily listed
Figure 4.17-4 Scriber Creek Park Potential Impacts with Alternatives C1 and C2.
However, Scriber Lake Creek is labeled where Scriber Creek is.
Page 1-4 1.3.1 – Aquatic Species and Habitat, 1.3.2 – Vegetation, Terrestrial Wildlife and Wildlife Habitat and, 1.3.3 – Wetlands. *They talk about looking at impacts 100-200 feet outside the direct project area. Sprague's Ponds are across the street from Scriber Creek Park and I've read no mention on the impacts the Light Rail would have on that waterfowl and wildlife area.*
1.4.3– Avoiding and Minimizing Impacts on Sensitive Ecosystem Resources. *If Sound Transit's first priority is to avoid impacts to sensitive areas, then why are they building on a wetland, watershed, and wildlife habitat?*

Subject: Lynnwood Link - for the record

My name is Linda Willemarck. I live at 4900 200th St SW in Lynnwood. Since learning about the Sound Transit's Alternatives for the Lynnwood Link, a mere 3 months ago, I have spent a great deal of time trying to understand what properties are involved and what impacts it will have.

I-387-001 As you know, both the C1 and C2 Alternatives would be going down 52nd Ave West/Cedar Valley Road. In my research I found a very compelling document that really puts into perspective the importance of this area. The document reads, quote "...an established single family neighborhood containing hundreds of affordable homes and is in close proximity to several affordable housing apartments and condominium complexes, all of which would be adversely impacted by light, noise, property values, and other impacts ..."
"directly impacts hundreds of affordable homes when there are other sites available, raises social justice issues..."

I-387-002 "...located adjacent to significant city recreational resources of Scriber Creek and associated wetlands, and the city's Scriber Creek Park, that provide places to experience nature in close proximity to Lynnwood's City Center and regional Interurban Trail, both of which would be negatively impacted..."

I-387-003 "...Therefore, the City Council of the City of Lynnwood does hereby resolve and request the Sound Transit Board to remove from its potential sites and evaluations list the Lynnwood 52nd Avenue West/Cedar Valley Road site..."
....that such site not be included in any environmental analysis, due to its many significant and unresolvable and irreparable impacts upon the City of Lynnwood, its residents and businesses and upon the Edmonds School District."
These quotes were taken from Resolution No. 2012-07 of the City of Lynnwood, Washington, regarding issues concerning the potential siting by Sound Transit. It was signed by Mayor Gough of Lynnwood on 10/22/2012.

1

I-387-001

Thank you for your concerns about the impacts to neighborhood character and cohesion from Alternatives C1 and C2 in Lynnwood. Section 4.4 addresses neighborhood impacts and Appendix C provides an Environmental Justice Analysis.

I-387-002

See Sections 4.17 and 4.18, which evaluate impacts to Scriber Creek Park under the various alternatives.

I-387-003

Thank you for your comment that summarizes the City of Lynnwood's Resolution 2012-07.

Lynnwood Link Extension Representatives
Sound Transit
401 S. Jackson St.
Seattle, WA 98104

September 22, 2013

Dear Sound Transit Representatives,

My name is Indra Ekmanis and I am a 24-year-old doctoral student at the University of Washington. I am writing in support of the efforts to preserve and maintain access to the Seattle Latvian Church and Community Center, which is currently in the path of the proposed Lynnwood Link light rail extension. I would like to convey the profound cultural, religious, and academic impact this Center has had, both on my personal life and those of my peers, as well as on the greater Seattle community; I request that you address these attributes of the Center in continued planning for the Link extension.

I relocated to Seattle two years ago as a master's degree student in the Henry M. Jackson School of International Studies at UW, from which I graduated this June and where I will continue my doctoral studies. Here, I worked in close concert with the Baltic Studies Program at UW, which is a program unparalleled in the entire country and which functions, in large part, from the support it receives from the Latvian Center and associated Baltic communities in the Puget Sound area. This Program is of great importance, not only to the University, but also to the field of multidisciplinary area studies in a region that is critical to U.S. and European security prospects, economies and cultural development. Should it be of interest, I invite your request for any policy briefs I have written on the significance on the Baltic States, which demonstrate the necessity of such a Program to be active and functioning.

The Latvian Center is a critical support beam for this Program — this extends beyond the support of individuals who may belong to community organizations to the actual building itself. The Center is the main gathering place and host multiple fundraisers critical to the continued functioning of the Program at the University. Given the current fiscal threat to higher education, this is more necessary than ever before. The financial support emanating from this community is certain to be negatively affected if the Center faces relocation, taking a severe toll on the academic offerings of the University through this important Program.

In addition to its unmatched support for the Baltic Studies Program, the Center is a critical hub for multiple generations of individuals to come together. Without this Center, I would have been lost in my transition to Seattle. Indeed, my community revolves around this Center; my week is full of activities hosted within its walls. Wednesday evenings are dedicated to choir practice, Saturday mornings I teach third grade students at Latvian school, Sunday mornings are for church services, Bible study and meetings, while Sunday evenings I rehearse with our award-winning folk dance ensemble, Trejdeksnitis. Youth organizations, such as the Association of Latvian University

I-388-001

Students and the American Latvian Youth Association, also make use of this space for community building.

Not only do I participate in the multiple events hosted at the Center, but the connections forged here have also led to being active in the greater Seattle and world community. Indeed, Trejdeksnitis has participated for years in Seattle community enrichment programs, including annual performances at the Seattle Public Library, as well as in various Folklife festivals. Trejdeksnitis was the most advanced American dance group to participate in this year's Latvian Song and Dance Festival in Riga, where we represented Seattle with pride. Removing access to this space would be catastrophic, degrading activities that not only foster our community growth, but bring recognition and interest in Seattle to communities across the world.

The Baltic communities have contributed much to the Seattle area. This property, built by individuals who saw their homes decimated by the tragedies of World War II, is a testament to the rich history of immigrants who have added greatly to the culture and economy of Washington State. This building is a vital gathering place for multiple generations. Indeed, without this center, children and young adults from our community would be robbed of the ability to actively interact with the refugee generation that sought solace in the aftermath of a horrific war. The importance of these connections cannot be stressed enough — to require a relocation or lack of access to this Center would decimate this tie to the past and to the history of these individuals.

I write this letter to stress the vitality and necessity of this community, not only for those who built it many years ago, but those who will continue to use it for many years to come. I appreciate the efforts of Sound Transit to develop the public transportation system, but I urge you to follow the options that will not cause detriment to a Center that has done, and has the potential to do, so much more good for the Seattle community. I request that you address these points and invite any request for additional correspondence.

Sincerely,

Indra Ekmanis

Many, many years ago a wise man, called Hippocrates, in his writings said: "Do no harm!" The medical field has the Hippocratic oath that also incorporated the same idea.

The planners of the Light Rail certainly would benefit from this advice. Harm arises from not considering the repercussions to a large group of taxpayers. The various groups using The Latvian church and community center worked very hard to provide a place where to continue using their cultural values. These ethnic activities enrich not just them but also a much wider circle. None of these people expect government largesse but they do expect consideration from the government when it proposes to take away their way of life.
The loss of the center would irreparably damage all current activities.
Cultural activities should be valued and not dismissed. Consequences matter.

Ilma Apsitis

Subject: Lynnwood Link Extension Draft EIS Comment Submittal

I-390-001

I have a few concerns about Link Light Rail "access" and "storage" for bicyclists.

One cyclist I know who has used the Vancouver rail with his bike said that it was quite easy to use, although he commented that they don't allow bikes on the stairs, so he had to use the elevator.

Another cyclist that I know, who emailed me a few weeks ago, said that he's used our Seattle Link light rail with his bicycle at different locations, and he said that if it's an elevated or below street level boarding area for the light rail, then he was forced to have to use the very small & crowded elevator or carry his bike on the stairs, which was okay for him (he's strong). Then once he boards Link light rail, the area on the rail car that is now labeled "bikes & luggage" was already full with luggage, so he had to hold his bike near the boarding door, so it wouldn't flop over, while he rides the Link.

I was a bicycle & Sounder commuter for 3 years between Edmonds & Seattle. In my experience with the Sounder train station in downtown Seattle with my bike, the elevators are always overcrowded and I would end up waiting for at least 2-3 elevator runs up & down before there was room for me & my bike. I finally started going to the least-used set of stairs on the very south-end of Seattle's train platform & carried my bike up to street level...I got stronger doing so too, but some cyclists might not be able to do the same.

I also sometimes ran into an overcrowded problem on the Sounder train, typically during the summer, but especially in busy May (bike month) when many cyclists start to ride the train with their bikes for just the one month and would fill up the reserved spots on-board for "bikes or wheelchair", so I also had to sometimes stand holding my bike near the boarding door for the half hour ride, or wait for the next train & hope that it had empty bike spots.

Early on in my bike/train commuting days, one day on the Sounder while I was riding home to Edmonds, one of the two too-short Velcro straps that go through the bike wheels to hold the bikes upright came off my bike's rear wheel, and with only my front wheel then being held by a strap, when the train jostled through a rail switch on the tracks, my bike flopped over and my front wheel rim (still strapped in) got severely bent. My bike was positioned in the spot next to the aisle, not next to the wall. The other bike next to the wall had bulky and thick packs/panniers on both sides of its rear wheel, which forced my bike's position even further away from the wall, and thus the Velcro straps were not really quite long enough to securely hold my bike in-place when going over the rail switch, as I learned that day.

There are various alternatives (location & type of station) for the Lynnwood Link Extension being considered right now, for all 3 segments: A-Shoreline area, B-Mountlake Terrace, C-Lynnwood. Most of the station types for segments A, B, C being considered are "elevated" station options. Very few are "at grade".

1

I-390-001

Thank you for your input regarding bringing bikes aboard light rail vehicles. While the amount of storage on board Sounder trains is not within the scope of this project, providing adequate access for bicyclists to get their bikes to the train is considered and provided for in the station design. Stations will include bicycle parking. The inclusion of bike gutters is a final design decision, so whether stations will include them is unknown at this time.

So my concerns are:

I-390-001

1) About accessing an elevated platform. Will bicycles be allowed on both stairs & elevators? Will bike gutters/runnels be in-place?
2) I did not see any information at the August 14 open house (at the Nile Shrine Golf Center in Mountlake Terrace), nor in the Draft EIS, about where & how bicycles can be stored on the future Lynnwood Link rail cars once a cyclist has boarded. Bike hooks on Amtrak seem to work well, I've heard. The reserved "bikes or wheelchair" spots (two bikes, side-by-side) on the Sounder trains work fairly well, as long as your bike is the first one loaded next to the wall, but if you are the second bike loaded (nearest to the aisle), then the Velcro strap may or may not be long enough to securely hold your bike upright, as I experienced, and I ended up with a very badly damaged wheel rim when my bike fell over. My bike was un-ride-able when we arrived at the Edmonds station that day.

Thank you for your consideration of my observations and questions.

Regards,

Jan Ahlquist-Niemi
Co-Chair

Edmonds Bicycle Advocacy Group

Re: The Latvian Church/Center

I-391-001

I was horrified to learn of the impact that he light rail would have on our Center. I moved to the State of Washington from Alaska twenty-three years ago and the Center has become important in my life. I have attended concerts, lectures, folk dancing, cooking classes and church services. I have also used the Latvian Library at the Center. I have attended events by the Lithuanians and Estonians, who rent the Center. I help out at the annual rummage sale that provides inexpensive goods for the local community, a lot of students and immigrants attend the sale to purchase items they couldn't otherwise afford.

I'm concerned because of the noise level, lack of access and lack of parking if the light rail is built near our Center. Today, the President of Latvia and some of his staff attended a function at the Center and we had a huge turnout. The Center had the windows open because it was warm. I can't imagine being able to hear a speaker, if the windows are open and the light rail is going by. The attendance was so large, that parking overflowed into the surrounding neighborhood. It would be difficult to park, if we lost part of our property.

It's ironic that in 1970 we lost by eminent domain our Latvian Center so that Seattle could have a park! Please tell me that this is not going to happen again. I've reconnected with my Latvian heritage and I would like to continue participating in events at the Center.

Anda Allen

1

I-391-001

Thank you for describing the importance of the Latvian Center to you.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Project noise impacts are evaluated in Section 4.7 of the Final EIS. At the location of the church, there would be a wall separating the light rail from the church property. See Figure G-17 in Appendix G, Visual Simulations and Illustrations.

Subject: Seattle Latvian Lutheran Church

Attn: Lauren Swift

Dear Ms. Swift,
My voice is small and insignificant and I trust that you are making every effort to add your wisdom to this process. The only thing that I can offer to help you in this matter is to share a little bit of the history of this church.

I-392-001

It is important for you to know that this is more than a church it is a community and cultural gathering center. The Latvian community, culture, language, music, folk art and identity have thrived because of the vision and hard work of members of the Latvian community.
This was a self-funded work of love and labor to build a place (and the significance of place can never be overstated) for generations to gather, to share their religion, teach their language to the children, to teach Latvian folk dance and songs, to have New Years Eve parties, celebrate Christenings, Confirmations, Weddings and funerals.

It was always important to the WWII Latvian emigrants who were fleeing the war zone that was Latvia to be together. This place was the center for the gatherings and events. The many elders of the Latvian community who planned and saved and did the hard labor to build this church worked so hard for so many years to perpetuate all that was important to them. They worked so future generations would know their heritage. You can walk into the foyer and see so many Latvian folk symbols. The Red, White, Red Latvian flag so respectfully hung to honor a recently deceased veteran. The love of nature that is central to Latvians is evidenced in the thoughtful yet simple arrangements on the tables. You can see Latvian art on the walls as well as sculptures and carvings. These people were very deliberate in their planning and execution of this site. It is private so as to not impact the neighborhood. The kitchen facility is impeccably planned to serve the needs of the many gatherings and the preparation of traditional foods that are such an important part of any ceremony. And because this place was the heart of the people, the place for coming together, it has served as the anchor for all that is important to the Latvian people.

The need for this place was clear to the now deceased elders, they knew what the coming generations would need and their legacy needs to be respected. Now they are gone but the "rock" they built still stands as a beacon to the younger people who must work even harder to preserve their heritage and culture. The future of the Latvian community in Seattle is at risk without this space. As the elders pass on, the history, stories, songs, plays, foods and traditions are gradually being diluted and risk being lost. You may say that the Latvian culture can still be found in Latvia. This is not exactly true. The current day Latvia is a post-war Latvia that has had to try to survive under Soviet rule. The Soviets banned the language and music, destroyed literature written in Latvian and changed the names of the streets. The "ethnic" Latvians living there today, that were born during the Soviet occupation don't even speak Latvian, they speak Russian. So this church is actually a little island being overtaken by the dominant culture, while the culture of the homeland has been forbidden for so many years. They are trying to re-build Latvia IN Latvian. So, it is imperative that this church remain where it is. What was built with love so many years ago cannot be built again.

Please, anything you can do the protect the history and memories of this Church will be so appreciated. I pray for you the vision to see all possible solutions.

Sincerely,
Cheryl Anderson
Serila Andersons

Subject: The Latvian Center and light rail

I have been active in the Lithuanian-American Community for 15 years. The LAC does not have its own church or hall in Seattle. While some smaller gatherings of our organization are held in members' homes in and around Seattle, we hold most of our meetings and celebrations at the Latvian Center. Two years ago I even moved to the Northgate area to be closer to the Latvian Center.

I-393-001 It would be very disruptive to our community if the Center was closed during construction of the rail line or worse still if the Center had to be closed and relocated. I urge the Sound Transit Board to consider the unique status of the Center in the social web of the Lithuanian, Latvian and Estonian communities. We all gather there with our extended families to celebrate significant events in the lives of our communities and our members. That family web may be destroyed beyond repair if the Center could not be used during or after construction.

Please take any and all precautions to reduce the impact of dust, noise, vibration. Give us access during construction.

The caretaker's house next door is vital to the daily operation of the Center. Can you find a way to save it?

When construction is complete we expect that there will be changes we will have to live with but we also expect Sound Transit to restore the site to something resembling its present condition.

Rimas Miksys

I-394-001

I am writing in order to express my concerns over the plans for the Lynnwood Link Extension of the Sound Transit Link Light Rail system that may affect the accessibility and usability of the Seattle Latvian Community Center at 11710 3rd Avenue NE.

I moved to the United States to do my Master's in Civil Engineering at University of Washington a year ago and became an active member of the Seattle Latvian Community only this February when I joined the folk dance group "Trejdeksnitis" and a choir "Sigulda". Ever since then I have been coming to the Community center twice a week for the rehearsals and participated in several concerts that have been taking place there. Both singing and dancing is a very important part of Latvian culture and I have been doing one or another or sometimes even both of them at the same time for most of my life and I feel extremely happy to have the opportunity to do it again here in the Seattle Latvian Community Center. Moreover, this summer I also had the honor to participate with the Seattle Latvian folk dance group "Trejdeksnitis" in Song and Dance Festival in Latvia that takes place every five years and unites tens of thousands of Latvians from all around the country and overseas communities in several unforgettable performances.

Having grown up in Latvia and getting to personally know the American Latvian Community only a half a year ago I've became truly impressed about all the effort that these people are putting in order to keep the Latvian traditions, language and culture alive this far from our motherland. I knew, of course, already before coming to the United States that there existed such communities, but I had no idea that they were as active and large before I got to know the Seattle Latvians. Most of these people have lived here in America for the past 60 years and their children and grand children have been born and raised here, but still they are able to speak Latvian, sing Latvian songs, celebrate all of the traditional Latvian holidays despite that many of them have been only a few times in Latvia and some of them have even never been there at all and from time to time when I'm talking to them I have to realize that actually sometimes the American Latvians know more about our traditions and history than I - as a person, who has lived most of the life in Latvia and many of my friends back home would do. However, while being very oriented towards keeping the Latvian traditions alive in their families and the community, meanwhile all of the community is very opened and respectful also to the local – American Society. Both - the dance and choir practices as well as most of the concerts are conducted in English thereby making them opened to everyone who's interested in joining these activities and I know several American spouses of Latvians that do take part very actively in it and take the opportunity to explore and get to know more about our culture through dancing, singing and just being surrounded by the Latvians.

From the very first time when I came into the Latvian Community Centre here in Seattle I've always felt warmly welcomed there and in this half a year since I joined its activities I've gained several really close friends there and I can not anymore imagine my life without having this place to meet for all the practices and celebrations. It has become an absolutely integral part of my daily life here in Seattle and if it would have to be closed down or become inaccessible for even just a period of time, I would feel that as a huge personal loss.

I-394-001

Thank you for describing the importance of the Latvian Community Center to you.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Noise walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, any existing WSDOT noise walls removed as part of the project will be replaced.

I-394-001

I would also like to pay an attention to the importance of the possible negative effect of the noise caused by the light rail transportation to the church services which are taking place in the side of the building at the closest proximity to the proposed light rail alignment and emphasize the importance of considering proper noise isolative systems. Even though I am not a member of the Lutheran congregation and don't regularly attend the church services, the concerts of my choir are most of the time taking place at the Church and I expect that the noise coming from the traffic would be a noticeable nuisance for us to perform as well as for others to listen to our performances and therefore I would be personally influenced by the possible noise coming from the traffic.

All in all, now after six months of being an active member of Seattle Latvian Community, I can without any doubts say that the decision to join all of these activities has been one of the best things that has happened to me here in Seattle. I feel extremely grateful to all of those people from the community who have worked on creating the building itself and are continuously working to keep it working. We are a small nation having population of only around 2 millions, but most of us feel really explicit connection to our motherland no matter how far of it we actually are. Knowing that the Seattle Latvian Community once has already been forced to change its location due to a construction of new infrastructure in Wallingford, I think that going through a similar experience once again would cause a noticeable negative impact on the entire community.

This weekend the President of Latvia was visiting our community center and when he was starting his speech, the first thing he said was: "I really understand why this building is so extremely important to you - it is very homelike, it looks here as if I was now in Latvia." And I can totally agree to what he said. After I joined all the activities in the Seattle Latvian Community Center, Seattle has really become like a home – far away from home to me.

In conclusion I would like to emphasize that similarly like no one else in the community I am not against the building of Link Light Rail system and I do believe that it is a very important and necessary improvement of infrastructure to all of the inhabitants of Seattle. But meanwhile, I believe that a solution that has the least possible impact on our community's property and that would ensure continuous access and usage of this building can be found.

Thank you for your consideration.

Sincerely,

Ruta Ikauniece

Subject: Sound Transit Lynnwood Link Comments

I-395-001

My name is Linda Willemarck. I live at 4900 200th St SW in Lynnwood. Since learning about the Sound Transit's Alternatives for the Lynnwood Link, a mere 3 months ago, I have spent a great deal of time trying to understand what properties are involved and what impacts it will have.

As you know, both the C1 and C2 Alternatives would be going down 52nd Ave West/Cedar Valley Road. In my research I found a very compelling document that really puts into perspective the importance of this area. The document reads, quote "...an established single family neighborhood containing hundreds of affordable homes and is in close proximity to several affordable housing apartments and condominium complexes, all of which would be adversely impacted by light, noise, property values, and other impacts ..."

"directly impacts hundreds of affordable homes when there are other sites available, raises social justice issues..."

"...located adjacent to significant city recreational resources of Scriber Creek and associated wetlands, and the city's Scriber Creek Park, that provide places to experience nature in close proximity to Lynnwood's City Center and regional Interurban Trail, both of which would be negatively impacted..."

"...Therefore, the City Council of the City of Lynnwood does hereby resolve and request the Sound Transit Board to remove from its potential sites and evaluations list the Lynnwood 52nd Avenue West/Cedar Valley Road site..."

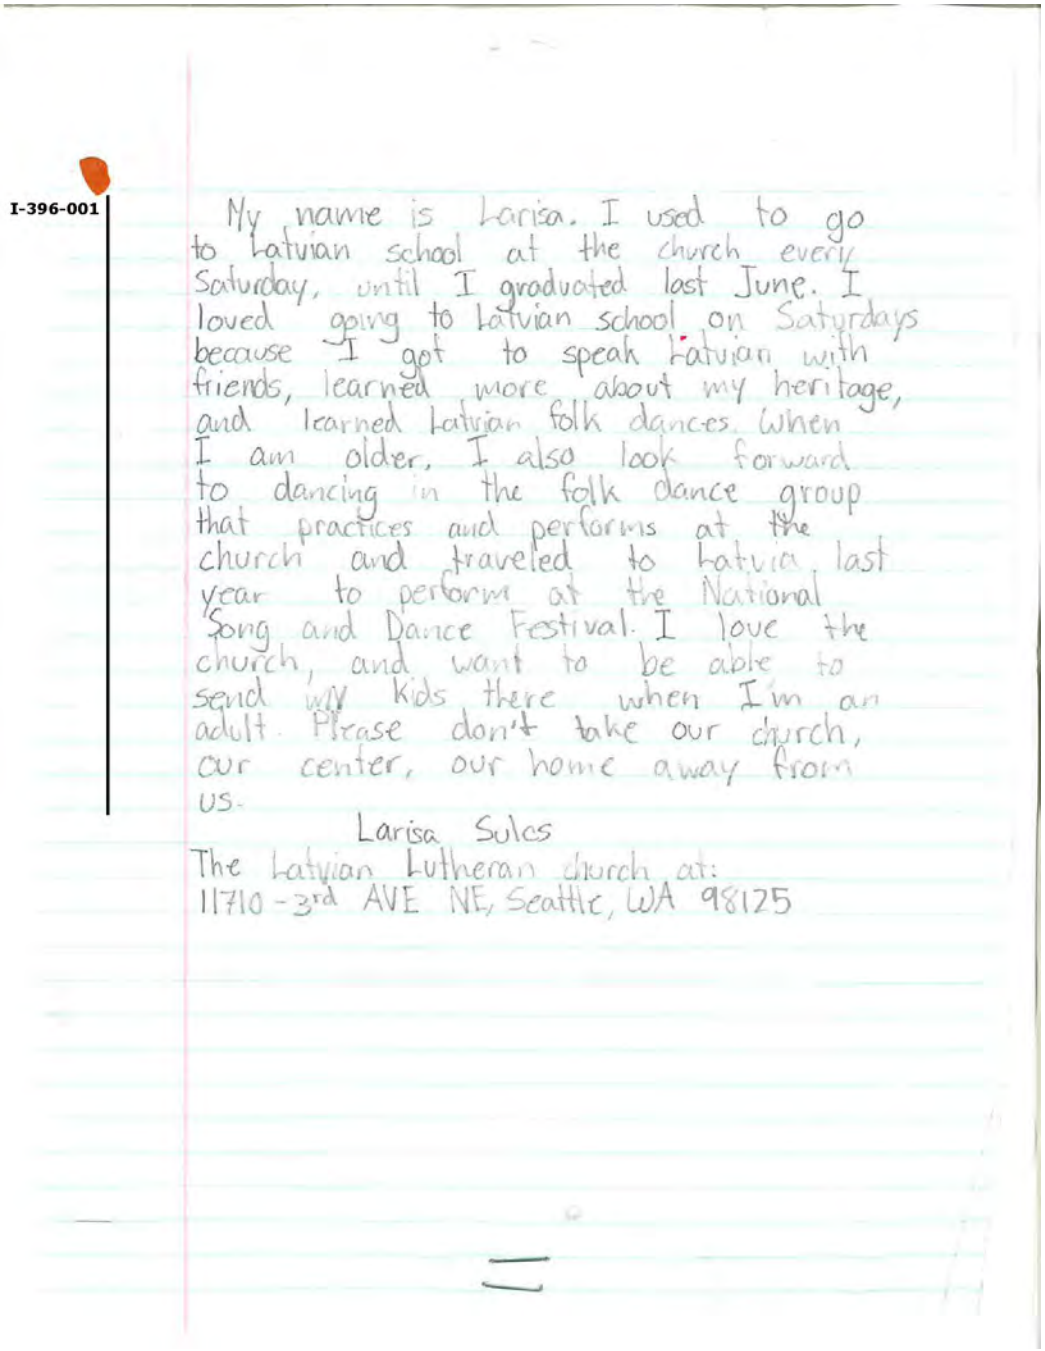
....that such site not be included in any environmental analysis, due to its many significant and unresolvable and irreparable impacts upon the City of Lynnwood, its residents and businesses and upon the Edmonds School District."

These quotes were taken from Resolution No. 2012-07 of the City of Lynnwood, Washington, regarding issues concerning the potential siting by Sound Transit. It was signed by Mayor Gough of Lynnwood on 10/22/2012.

1

I-395-001

Your comments regarding the impacts of Alternatives C1 and C2 on the community are noted. The Draft and Final EIS discuss in detail the potential impacts to neighborhoods in Section 4.4, Ecosystem Resources in Section 4.8, Parks in Section 4.17, and Environmental Justice in Appendix C. The Final EIS evaluates a modified Alternative C3 as the Preferred Alternative.



I-396-001

Thank you for describing the importance of the Latvian Lutheran Church to you.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Sound Transit wants to hear from you. Comments can be about anything related to the project, ranging from giving an opinion or observation to discussing technical aspects of the environmental analysis. The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

I-397-001

Comments I am an active member of Lithuanian community. Most of our events do happen in Latvian Hall. We do have our Independance Day Celebration for numerous years. Our kids do grow up dancing at the Latvian Hall stage. There we had many cultural events. Our community host weddings and memorable services at the Hall. Please consider to keep Hall open during the construction. Thanks Sincerely

Ausra Vastakas

Subject: Lynwood link / DEIS comment /130th 145th,155th St. Stations

Roger,

I-399-001 Hello. I am very excited for the light rail system and the ability to walk to a light rail station from my house. I do have legitimate concerns over the Shoreline City Council's recommendation for the light rail station and parking structure to be placed at 145th St. (SR-523) and I-5. The Shoreline City Council is not discussing the reality of the conditions of traffic on 145th Street, or the 130th/155th St. options with WSDOT, Sound Transit, or the community.

The intersection where it would be placed (145th St. NE and I-5) is already a highly congested area. According to WSDOT, the intersection and the stretch of NE 145th St. surrounding it is already, in their words, over-capacity. Adding another destination focal point can only cause more congestion.

There are a couple of contributing factors to this, including, but not limited to: * It is the only complete set of I-5 on and off-ramps between Northgate and 175th St. NE. * There is minimal queuing area for the cars to enter the I-5 on-ramps. Which creates backups on 145th St. east and west of the intersection and in-between on the overpass bridge. This, in turn, creates backups on the I-5 off-ramps. * It is a main arterial to I-5, that receives the bulk auto traffic not only from Shoreline neighborhoods, but also from Haller Lake, Greenwood, Aurora, Lake City,Bothell, Woodinville, Pinehurst, Lake Forest Park, Kenmore, and east-side traffic. * According to WSDOT, traffic increased 11-15% on NE 145th St./SR-523 after the 520 bridge was tolled and people started using it as the connector around the north-side of the lake to I-5.

Currently, 145th St. east and west of the I-5 intersection during morning and evening rush-hour has two-lane 1/4 to 1/2 mile backups of cars waiting to go northbound and southbound onto I-5. One of the major problems is there is no good way to mitigate the issues of a light rail station on 145th. Some of the ideas floated are: * Add complete sets of off and on-ramps at 130th and 155th St. to reduce the influx of vehicles that use 145th. St solely for the purpose of I-5 access. (which WSDOT says it will not do) * Acquire hundreds of folks properties to widen the 145th arterial, in some instances this would place a state highway within feet of Seattle and Shoreline folks' front doors, or directly in the path of current homes. There is also current infrastructure and or protected spaces in the immediate vicinity, such as a pumping station, Thornton Creek, and the Jackson Park Golf Course. * Add direct on and off-ramps to the station and parking structures from I-5.

1

I-399-001

Your comments voicing concern about the NE 145th Street Station location are noted. Sound Transit will mitigate traffic impacts caused by the project at NE 145th Street; however, building additional I-5 ramps to/from NE 130th and NE 155th Streets is outside the scope of this project. Sound Transit is currently coordinating with both the City of Shoreline and WSDOT on potential improvements in the NE 145th Street/I-5 interchange area.

I-399-001 When I asked the Shoreline City Council how they plan to address this, or if they have worked with WSDOT to address these concerns, I receive blank stares and replies along the lines of "WSDOT will mitigate any issues". When I asked WSDOT if they had an official position, they said they had not released one but would be more than happy to talk to Sound Transit about the facts. I encourage you to speak to the WSDOT planners and employees who control this area.

I-399-002 I have been to multiple Ridgecrest community meetings, and to the majority of the folks in the effected neighborhoods it makes much more sense to have the proposed two stations at 130th St. and 155th St. Some contributing factors supporting this are: * The already over-capacity and congested NE 145th St. arterial. * 130th is an arterial from Greenwood/99 to Lake City, but currently does not have the congested traffic that 145th St. does. *155th is an arterial from Greenwood (via turning into Westminster Way, which turns into Greenwood), Aurora/99, to 15th Ave. NE * The more stations a mass-transit system has, the more people will have access to it, and more people will use it. The two stations, 130th and 155th St. would server a greater amount of citizens and provide access to more light-rail riders. * Two stations will split the traffic, and if applicable, the parking between two stations. * It will allow people to access the stations from 130th(125th&Roosevelt&130th), 145th, and 155th (All of which are East/West arterials). * 155th St. and 130th St. both have designated bike lines. 145th Street does not have a bike line, and is not safe for bicycle traffic. * 155th St. and 130th St. both have newer accessible sidewalks. The 145th St. and I-5 intersection is not very walkable, nor accessible. The sidewalks, where they exist, are not accessible. * It creates easy light-rail access not only for the Ridgecrest and Parkwood neighborhoods, but also for Lake City, Pinehurst, Bitter Lake, Haller Lake, Olympic Hills,and Broadview. * This will free up the East/West arterials for the crosstown bus routes to feed the stations. * Less, if any at all property and homes would need to be acquired. The property around the proposed 130th St. and 155th. St. stations are owned by the municipalities.

If you can, please visit and observe the congested NE 145th St. and I-5 intersection during morning or even rush hour. You will see how wanting to place a light rail station at 145th St. is very troubling.

Thank you for your time.

Ryan Basile 921 NE 146th Street Shoreline, WA 98155

2

I-399-002

Your comments in favor of the NE 130th Street and NE 155th Street Station locations are noted. Although the Preferred Alternative in the Final EIS does not include these station locations, Sound Transit did continue to evaluate them in the Final EIS.

Chapter 3 evaluates potential impacts, identifies mitigation measures, discusses bike and pedestrian improvements in the station area, and ridership.

Draft EIS Comments c/o Lauren Swift
401 S. Jackson St., Seattle, WA 98104

Dear ladies & Gentlemen,

I am a member of the Latvian Ev. Lutheran Church and Community center (11710 - 3rd Ave. NE Seattle, WA 98125)

since 1961 - In USA since 1951.

I-401-001

The present proposed route of the Lynnwood Link light rail will destroy our Church and Community Center: first the construction equipment, noise etc. and later the light rail itself passing every 3-10 min. in front directly of our church's

I-401-001

Thank you for describing the importance of the church to you and the community, and for discussing its history and activities. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Although construction activities will be adjacent to the church, Sound Transit will work closely with the church to maintain access, minimize parking loss, and reduce other potential construction disruptions to ongoing church and center activities. The primary construction in the area would be ongoing for 1-2 years in the area, but major construction activities would be shorter duration. For temporary impacts such as truck traffic, detours, noise, dust, light and glare, Sound Transit proposes best management practices to avoid and minimize impacts in Sections 3.6, 4.5.7, 4.6.7, and 4.7.7. The construction area would also be fenced to protect public safety, and the church would have a direct contact at Sound Transit to discuss any issues of concern. When operations begin, noise and visual impacts would be minimized by the sound walls proposed along the guideway.

I-401-001

II & IV doors and windows, school-children's playground.
Your engineers know that better than we can imagine!!!
Therefore I ask you to find an alternative route more distant from our property. I am convinced that this is possible once your engineers know & can do that.
The reason I am asking you to respect our church's property on the present piece of land / location - because it was build only with our own caring hands and hearts. -> The Latvian W.W.II refugees, who had lost everything when the soviet army for the second time at the end of W.W.II occupied their country Latvia.
The IRON curtain came down and divide the people. There was no way back for us.
They had lost everything - their country, their homes - families were split, livelihoods gone.

III of IV many left only with what they could carry, previous lives destroyed We needed each other to survive in a new foreign country - kind but strange country, foreign language - we needed each other for moral support, for companionship, also financial support.
And we build our church and the center and made a new life in this country that gave us the opportunity to do so. And we worked all together giving each other moral, physical support and companionship It helped us to start new life - find jobs, educate our children and by now we all had rediscovered the old Latvian truth - Education - education & health / community - you can loose everything, but if you have these 3 things - there is always possibility for survival
It is a memorial for a group of the Baltic refugees, many by now dead. Between the many

I also my late husband who with our late pastor Abolins was hammering nails on the church roof.

This present piece of land and the buildings on this particular piece of land is so important to us - as a memorial as something that will provide continuation between the builders, their children, grandchildren and their children - so they know who they are, where they roots are and who grand and great grandparents left their own country. Don't destroy something beautiful and unique just for convenience sake.

Do the right and just thing.

Thank you -

Dzidra Rasevska

My family and I are long-time members of the Seattle area Lithuanian community. As such, the Latvian Church and community center in Northgate have been used and are being used for everything from my best friend's wedding to funerals of community leaders. I have been coming there with my family for almost 30 years (since I was born). It is of utmost importance to us that the community center remain open & usable during the building of what will hopefully be an elevated rail. We do not want anything to impact the strength our communities have built in preserving our long marginalized culture over the years.

I HAVE BEEN A LIFETIME MEMBER OF THE LATVIAN LUTHERAN CHURCH AND CULTURAL CENTER IN NORTHGATE. IT WOULD BE A DEVASTATING LOSS TO THE WHOLE LATVIAN COMMUNITY IN THE STATE OF WASHINGTON TO LOOSE THE USE OF OUR CHURCH AND CENTER FOR ANY SHORT OR LONG PERIOD OF TIME.

I-403-001

OUR LATVIAN HERITAGE IS VERY IMPORTANT TO ALL OF OUR FAMILY. OUR CHURCH AND CENTER ARE THE HEART OF OUR LATVIAN HERITAGE, TRADITIONS, CULTURE, AND LANGUAGE. RAPID TRANSIT TRAINS WHIZZING PAST OUR FRONT DOOR WOULD TOTALLY DISRUPT ALL THAT. THIS IS A VERY STRESSFUL

I-403-002

AND TRAUMATIC TIME FOR US, SINCE WE REMEMBER THE CONDEMNATION OF OUR PREVIOUS CHURCH AND CULTURAL CENTER BUILDING, IN NORTH SEATTLE, IN 1969. WE DO NOT WANT HISTORY TO REPEAT ITSELF FOR THE SAKE OF OUR CHILDREN AND GRANDCHILDREN.

SOUNDTRANSIT RIDE THE WAVE

I-403-001

Thank you for your personal comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you. The project includes a noise wall in this area that would mitigate noise impacts to the church as well as adjacent residences. Please see Section 4.7.7 for details.

I-403-002

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Sound Transit September, 18, 2013

Comments c/o Lauren Swift

401 Jackson Street

Seattle, WA 98104

Our organization, Seattle Estonian Society (SES), has reviewed the Lynnwood Link Extension DEIS and concluded that all the alternatives presented severely impact the Latvian Church and Community Center. As a member of Seattle Estonian Society, I can assure that SES relies heavily on this facility for fund raising, performances and meetings. Any disruption to its availability, whether temporary or permanent, will disrupt SES's work especially since Latvian Churh is a main meeting place for our SES Board. Since Estonians do not have a place of our own, Latvian Church has become like home for us. SES would hate to see Latvian Center cease to exist, it will be a tremendous loss for our community.

I-404-001 Please make sure that all construction related impacts to the Latvian Center be mitigated in a manner which allows our continued use of this facility during construction, and that long term impact resulting from the operation of the light rail system be mitigated in a manner allowing our continued use of this facility.

Sincerely,

Mai Teras

Board Member of Seattle Estonian Society

I-404-001

Thank you for describing your concerns about potential effects the Latvian Evangelical Church and for highlighting its importance to the region's Baltic community. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Several sections in the environmental document have updated discussions of potential construction and long-term project impacts as well as describing mitigation that would allow the church and hall to continue their activities during and after construction. Section 2.5.1 describes the refined alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods; Sections 4.5 and 4.7 present discussions of visual and noise impacts respectively, including mitigation measures.

I-406-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Lynnwood Link impact on Latvian Center

Dear Sound Transit Board,

I-407-001 I am writing to you to let you how the proposed Lynnwood Link would impact my family and the Baltic community as a whole. Along with my parents, my family has attended church, Latvian school, folk dancing, concerts, plays and social events at the Seattle Latvian Center since its founding. My confirmation and wedding were celebrated in the church; I currently live in Kingston with my husband and our two teenage boys. Along with this third generation, we continue these same traditions – both of our children have attended and graduated from the Seattle Latvian School and continue to participate in events at the center. The Seattle Latvian Center is a regional gathering place for the entire Baltic community. If not handled correctly, the impact of the proposed light rail link will be devastating on this valuable group.

I-407-002 The Latvian Center and Church was designed and built by the community itself in its present location near Northgate after being relocated from Wallingford when the city of Seattle needed that land. To relocate

I-407-003 and rebuild again would be an unfathomable burden both emotionally and financially. I urge Sound Transit to proceed carefully and in good faith to allow us the use of our center while under construction, to mitigate noise, vibration, dust and any other impacts before, during and after without expense to the

I-407-004 center. If this is not possible, all efforts need to be made by Sound Transit to relocate the center to an equivalent location with room for all of the many groups that currently use it. As our current center and church were custom built with all of this in mind, the alternative must be equal to the current location in size, scale, interior customization and ease of access. I ask that you work with the Seattle and greater northwest Latvian, Lithuanian and Estonian communities to preserve this community resource.

Thank you,

Daina Birnbaums

Hillbend Lane NE

Kingston, WA

360-297-3304

I-407-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church.

I-407-002

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-407-003

Construction of the light rail guideway in proximity to the Latvian Evangelical Lutheran Church would take approximately 1 to 2 years, and mostly occur between 8 am and 6 pm during weekdays with occasional nighttime and weekend construction. Near-term construction activities would included outreach and coordination with the church. Access to the church and community center buildings would be maintained before and during construction, though the access may change somewhat from existing conditions for short periods. Visual, air quality, and noise impacts would be avoided and minimized with the implementation of best management practices. These would include fencing the construction area for public safety, spraying the construction area with water to reduce dust, and use of temporary noise walls. For additional information, see Sections 4.5.7, 4.6.7, and 4.7.7, respectively.

The discussion of potential long-term impacts associated with the refined Segment A alternatives has been incorporated into the the Final EIS. Section 4.5.2 describes visual and aesthetic impacts; Section 4.6.2 outlines impacts to air quality; and Section 4.7.2 presents anticipated noise and vibration impacts. Potential mitigation measures

for unavoidable impacts are listed in the following sections respectively: Section 4.5.7, Section 4.6.7, and Section 4.7.7.

I-407-004

Thank you for your comment. Please see the complete response to Comment I-407-001.

Subject: Lynnwood Light Rail

Hello -

I have been a resident of Lynnwood for 20+ years and commute to Seattle for work using bus service from the Lynnwood Transit Center.

I-408-001 Having reviewed the documents available online, I believe Segment C3 (at park-and-ride) provides the best alternative given the known potential impacts vs benefits.

Thank you for taking my input into consideration.

You are doing a great job of of informing the public and inviting input.

Anne Cunha
6600 191st Street SW

Subject: DEIS Comment

Regarding the DEIS for the 185th Street station location:

I-409-001 The current DEIS suggests options for building one large or a couple small parking garages. One idea floated is to have one small garage on the West side of I-5 that would also serve as stadium parking for the Shoreline School District.

It is premature to offer suggestions for building parking garages without first doing a traffic study. Parking needs for the stadium are seasonal. There is some overflow parking on 185th and 5th Avenue during football season on Friday nights. The rest of the time the existing lot is largely empty.

Has the Shoreline School District been asked whether they intend to even keep the Stadium? They might like to get a big check from a developer instead.

Even with anticipated increase in traffic and demand for parking with the addition of a station, Sound Transit needs baseline knowledge of existing traffic patterns in the area before they can justify building a parking structure.

I do not have an opinion of whether a station should be built. I would like to see a traffic study before making any conclusions.

A second concern regarding parking:

I-409-002 Sound Transit has a limit as to how much money can be invested into the community to mitigate the impacts of the station. If a lot of funds are spent on a parking garage, those are funds that will not be available for sidewalks, cross walks and stop lights, which are items required for pedestrian and auto safety in order to make the new station acceptable to the community.

Sound Transit cannot assume that the City of Shoreline has the resources to provide these amenities. The City will instead expect developers to build sidewalks and stop lights as part of TOD. This strategy would result in piecemeal upgrades without the connectivity required for a safe and effective traffic plan.

For the sake of better decision making it is imperative that Sound Transit disclose to the community the consequences of each decision. What are the opportunity costs? For example, if X dollars are spent on parking structures, how many street lights and sidewalks would have to be eliminated from the plan?

1

I-409-001

Sound Transit has been coordinating with the Shoreline School District, which has expressed an interest in a shared facility. Section 3.2.4 of the Draft EIS documents the traffic analysis conducted at each of the potential station locations, including surrounding the NE 185th Street area. Morning (AM) and evening (PM) peak hour conditions today, and in the future with and without the stations were analyzed. More detailed documentation is included in the Transportation Technical Report that supports the Final EIS. Chapter 3 identifies the improvements and mitigation that could be implemented with the various alternatives, all of which assume parking as part of a multimodal access program.

I-409-002

Although Sound Transit has defined a project budget, it is also committed to mitigating adverse impacts identified in the Final EIS. The Preferred Alternative and other alternatives have defined bicycle and pedestrian improvements in the station area, and the project does not create safety hazards requiring mitigation.

I-409-002 The tendency of the community is to envision grand plans without an understanding of the budget limits involved. Then, the City and/or other agencies are blamed when the citizens are disappointed with the end results. Better upfront disclosure of what is/is not feasible will help the community prioritize what it is they want to lobby for.

I was a member of the 185th street station committee from its inception but had to withdraw due to changing family responsibilities. Therefore, my concerns were not included in the letter that you received from them.

There are others in the community who have expressed similar concerns or do not want to see a parking structure built at all. Their voices are also not represented by the 185th Street Station organization. The committee has done a lot of outreach to residents to inform them of the station and that now is the time to weigh in on its design.

Thank you for considering my comments.

To: Lynnwood Link DEIS
Subject: DEIS Lynnwood I

Morning,

Instead of a long letter, the following are some final thoughts.

I-410-001 a. Glad to see all line on east side of I-5 until above Lake Forest Park station then down I-5 median.

b. Believing immediate access between parking structure, local buses and light rail is design's highest priority, Lake Forest Park station should also be on east side of I-5.

I-410-002 c. Lynnwood Park and Ride station. With future extension of light rail to surely to Paine Field's future commercial airport and Everett, distance equals time which makes the straight-line down I-5 favored. However, I prefer Option A because it eliminates the long walk between the far ends of the parking structure and the station--distant parking is much closer to trains but moreso is safety for people walking to cars late at night. Surely the shorter the distance between cars and trains also reduces cost of security officers making Option C more expensive to operate.

I-410-003 d. All stations seem to have a maximum parking structure plan of 1900 cars. Are all stations designed for future expansion? My thoughts return to the Silver Spring, MD parking structure for the DC Metro station. Would be

I-410-004 interesting to learn the vehicle capacity of that parking structure--it includes parking over a street. Related to this would be to learn how much they spend on security patrols at that station because the parking structure is separated from the station by the huge bus terminal and compare Sound Transit parking structure designs to projectable annual security costs to system budgeting.

Thanks,

Terry Forsyth
Friday Harbor, WA

1

I-410-001
Your interest in the median alignment is noted. We assume that you mean the Mountlake Terrace Station, and a preference for the station alternatives at the center, rather than the freeway station.

I-410-002
Thank you for the comment. The Preferred Alternative features a refined station design that places parking and the station close to the transit center, which reduces walk distances. Security costs at the system level would be generally similar for all alternatives, however.

I-410-003
Station parking, facility sizing, and design is balanced between the demand for parking and the need for good multi-modal connections in order to serve the needs of the region as well as local communities.

I-410-004
Security will be a consideration as the design of the station and parking area are refined in the Final Design phase of the project.

Subject: My Grandfather's Hands: Latvian Church and Hall

Dear Whomever it may concern,

My grandmother and mother are both Latvian refugees who came to America when Latvia was invaded by the Soviet Union. I was born right before Latvia was freed from the Soviet Union. Even though my parents lived in Utah at the time, they brought me to Seattle where I was christened and baptized in the Seattle Latvian Church at age 4 months. This Latvian church and hall wasn't and isn't just a place for worship, it is the only place that we can share our Latvian heritage, have Latvian language school, and get to know each other. My grandfather, over 40 years ago, helped build this church with his very own hands and last year we held his funeral service at this very church which was attended by over 100 other Latvians. Every event that occurs in the Latvian community happens here: birthdays, funerals, christenings, celebrations, school shows etc. I am 22 years old and I want to be able to provide my future children Latvian heritage and show them a building and a center that their great-grandparents created and built. This building has housed mine and every other Latvian's most important events of our entire lives. Not only does it provide a shelter for the Seattle Latvians, but it allows a place for Latvians from around the world to come and visit. In fact, the President of Latvia, who recently met with President Obama, will be visiting the Seattle Latvian Church and Hall at 11:30 am September 22nd 2013. My grandparents specifically bought their house over 40 years ago because it is less than a block away from our Latvian Center. I have spent many Christmases and New Years walking from our house to our Latvian church. I can hardly bear the thought of not being able to do that anymore, especially since my grandfather just passed and it is a place of solace in my grandmother's life. I am telling you all this because if you choose to destroy The Latvian Center you will not just be tearing down a building, you will be throwing a whole community into debt and disarray. Losing the Latvian church would not only break our hearts, it will likely be a blow that the Latvian community will never be able to recover from. So I please ask you to realize the consequences of this action and know that a whole community filled with grandmothers, grandfathers, teenagers, babies, and parents will be permanently affected.

I-411-001

Sincerely,
Viktorija R. Hill

Subject: Sound Transit Link Light Rail system impacting the Seattle Latvian Church and Center at 11710 3rd Ave N.E, Seattle, WA 98125

I-412-001

I am writing to voice concern over the proposed plans for the Lynnwood Link Extension of the Sound Transit Link Light Rail system as it pertains to the Latvian Church and Community Center.

I was born in Latvia in 1943 and in 1944 my family was forced to flee our home to escape the invading Soviet Army. We lived in a Displaced Persons camp in Germany until 1949 when we were sponsored by the Lutheran Church to relocate to Olympia, Washington. This is a story many Latvians of my generation have. My parents, along with fellow Latvians that emigrated to Washington, worked hard to build a new life in America after losing everything.

My parents eventually settled in Sumner, Washington and were active in building the foundation for both the Tacoma and Seattle Latvian Communities. My father even helped to build the Seattle Latvian Church and Community Center. As a community in exile, it was of the utmost importance to have a way to preserve our language and heritage and to guarantee that it would be passed on to future generations.

As my parents grew older, I would drive them up to Seattle regularly to enjoy cultural and religious events, such as weddings, confirmations, holiday parties, plays and programs. I can attest to the fact that the Church and Community Center is as actively used today, if not more so, than it was during my parents' generation. Their dream of preserving the Latvian heritage is seen nearly every day at the Latvian center, from Latvian school to folk dance and choir, and larger community activities. Please don't deny future generations a chance to celebrate their heritage.

The Latvian Community Center has allowed me to keep active in my older years and stay involved with our community. Living in Puyallup, it is one of the few opportunities I have to meet and socialize with old friends and speak in our native language. I enjoy attending all of the cultural programming the Center hosts, including folk dance performances, the Christmas Bazaar, Latvian school programs, the annual Rummage Sale, as well as significant celebrations marking important Latvian holidays. I have also gotten involved with volunteering at some of these events.

I am also a member of the Tacoma Latvian Lutheran Church, which has been on the verge of losing a meeting place for our church services. It is becoming likely that our congregation will have to

I-412-001

Thank you for describing the importance of the church and center to your family and the Latvian/Baltic community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-412-001 start commuting to Seattle for church services, as this is our only other viable option. A loss of the Seattle Latvian Church and Community Center would mean the end of our congregation.

For Latvians living all over the Puget Sound, the Seattle Community Center is essential. It is the only place we are all able to gather for community and social events. There is no other place for us to gather without the Seattle Latvian Community Center. A loss of this center, even temporarily, would be devastating. I urge the Sound Transit board to work with us to find a solution that does not result in the loss of Seattle Latvian Church and Community Center. Please help us to keep our heritage alive for future generations and to not let everything my parents' generation worked for to be in vain.

Thank you,

Subject: Draft eis comments

The proposed impacts to the Latvian Community Center and church are not acceptable. The Latvian community in Seattle has had to suffer being uprooted from their homeland, then again uprooted from their original community center for "the public good" by the city of Seattle and is now under threat from wsdot and sound transit to be uprooted yet again.

I-414-001 The at grade alternative eliminates our access, reduces parking and condemns the caretakers residence while the elevated alternative transforms the entrance to our church and community center into an environment not unlike that under or adjacent to the elevated section of SR 99 through downtown. Neither of these are acceptable. The at grade alternative could be acceptable if through the adjacent condemned properties, the Latvian Community Center and church could be provided a new access, a new caretakers residence, parking, bike or transit support.

I-414-002 The elevated alternative could only potentially be acceptable if the elevated rail section were routed further west, maybe between the I-5 though lanes and the northbound northgate way on ramp/NE 130th street off ramp merge lanes. That might put it far enough west to avoid impacts to the Latvian community center, church and other adjacent properties. Please consider this as a potential solution to minimize impacts to the Latvians and other residents along this section of the light rail extension.

I-414-003 As the project moves forward, I expect that wsdot and sound transit will keep our community informed and seek our input on the design as the project moves ahead. Instead of simply asking us whether the visual and other environmental impacts are acceptable, why not engage and involve us in defining some of the aesthetic opportunities that might present themselves to reflect our culture and heritage within the actual design along this section of track. Form liner patterns are an example of something that could reflect our rich heritage to both riders of light rail and possible travelers along I-5.

I-414-004 The proposed alternatives both have impacts that have the potential to fatally affect our Latvian community and the greater Baltic community of Seattle and the northwest. Our community has to struggle to maintain our cultural identity and to convey our heritage to our children. We expect that the public agencies who are responsible for the Lynwood light rail extension will ensure that their project does not compromise our future and our children's futures.

Sincerely,
Ints Luters and the Luters family

1

I-414-001

Thank you for your concerns about the potential displacement of the Latvian Evangelical Church. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. The Preferred Alternative realigns the access road, which would also provide the opportunity to maintain adequate parking supply.

I-414-002

The potential for this approach was reviewed during early planning described in Chapter 2 of the Draft EIS. I-5 lacks the available median in this section of the freeway to accommodate light rail and construction impacts would be higher; relocating lanes would also be more impacting than the currently proposed alternatives. This is consistent with the review of potential alignments described in Chapter 2 and it reflects the results of the compatibility report developed in collaboration with WSDOT. The elevated alternatives require a similar amount of land on the west side of the church parcel, but they would not need to realign the road.

I-414-003

Sound Transit will continue to involve the church and the community as design for the project progresses.

I-414-004

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church.

Subject: Save the Latvian Church

I-415-001 Save the Latvian Lutheran church. The church has provided continuity for Latvian in culture. It is just as important now as it was during the Cold War. Perhaps even more so. Now that Latvia is free country once again the members of the church and their children can travel there and use their language and experience their culture. This is especially important for the children who went to Latvian school at the church. Now with the added incentive of visits to a free Latvia the children and grand children can in turn raise their children to be bilingual in English and Latvian. They are in a a unique position to appreciate freedom, democracy and self-determination .

Subject: DEIS comment

I-416-001

Good info in the DEIS. For the B section of Lynnwood Link, I support Alternative B2 or B2A. It will support the most ridership and transit-oriented development. A station on the east side of the Transit Center at I-5 and 236th Street is a priority for maximizing the use of light rail and ridership opportunities in this area. This is consistent with Alternatives B1, B2 and B2A. Aligning the rail line so that a future station is possible at 220th and I-5 is also wise; this can happen under Alternative B2 or B2A. More ridership is possible with transit-oriented development near both stations than is currently acknowledged in the DEIS.

Shane Hope, AICP
Community & Economic Development Director
City of Mountlake Terrace

Subject: Appeal to preserve Latvian Center in Sound Transit Expansion

Dear Sound Transit Decision Makers,

I-417-001 My name is Daiva Dambrauskas and I am a member of the Lithuanian-American Community of Seattle. I am writing today to ensure the continued lifeline of the Latvian Center which is under threat from the future Lynnwood rail link.

The Latvian Center has played an important part of preserving my own heritage and connecting me with others of my Baltic heritage (Lithuanians, Latvians and Estonians). Fourteen years ago I moved to Seattle from Chicago for a career opportunity. When I moved here, I knew all of one person in Seattle. Aside from this one friend, I did not know anyone of Lithuanian or Baltic heritage. A few weeks after my move to Seattle, I attended the Lithuanian Independence Day celebration at the Latvian Hall. It was at this event in the first few weeks of moving to Seattle where I met new lifetime friends who shared my heritage. Since that fateful day of attending the event at the Latvian Hall, I have worked with the Baltic Community at this site to host the St. Martin's Eve fundraising event for the Baltic Studies Program at the University of Washington as well as attend other Baltic Community Events.

Additionally, I write to express the unwavering need that the Latvian Center continue to be open during construction. Without the facility, these communities lack a space to meet for events that are hosted here: the Saturday school, the independence day celebrations of these three small nations, the St. Martin's fundraising event, church services,folk dancing and folk singing practices for the respective groups...the list continues one. Coupled with keeping the Center open also means that activity to mitigate the impact of construction; we will need access and parking and that power, lighting remain intact.

The Latvian Center in Seattle is unique and special in so many ways. I know of no other Baltic center in the United States that consistently supports all three Baltic communities. Seattle is a special place that has welcomed all three nationalities and enabled them to flourish under one roof, in one location. Any relocation or threat to the Latvian Center means a threat to all three cultures, all three communities and diminished access to a center of cultural importance.

Regards,
Daiva Dambrauskas

Importance: High

I-418-001

Dear Sound Transit,

The Latvian Center has been an important part of my life for over 20 years. Because of the Center and the communities it is home to (The Lithuanian, Latvian, and Estonian communities) the University of Washington has a Baltic Studies Program with a teaching staff. It is through activities at the center for over 20 years that this program has come into existence and receives continued support.

The Center provides on-going educational opportunities for university students, families, community members, and the public. Without the Latvian Center, these opportunities to gather in one consistent location would not be possible. The Center is a church and provides a wide variety of services.

My life-connection to friends both at the Latvian Center and in the Baltic countries is a direct result of the activities at the Center.

I urge you to keep the center open during construction phases, preserving parking access and the continuation of the Center as a facility after the construction is complete.

Sincerely,
Nanci Andvik
Lithuanian and Estonian Community Member

Subject: Please respect and preserve the Latvian Center of Seattle

Hello,

I-419-001 I am writing this email to express the importance of respecting and preserving the Latvian Center of Seattle during the upcoming Sound Transit rail link construction to Lynnwood.

Though I am not Latvian, I am Lithuanian and I know what it means to have your place of worship and cultural heritage threatened and, ultimately, extinguished by outside forces. I am not speaking of the experience of my parents who fled their native country to escape Soviet rule, but rather the struggle and ultimate closure of my own Lithuanian parish and school in Gary, Indiana. Since the closure of my parish and the school where I learned to read and write in my parent's native language, the Lithuanian community there has lacked a place to meet and experienced a slow and painful dissolution.

Having personally experienced the loss of my own cultural center, I fear that the outcome to the Latvian Center will also be one of dissolution. Creating and allowing easy access to the Center during construction will enable all of the users a place to meet and continue their social, religious and cultural events. Don't do to the Latvian Center as other outside forces have done in other places in the US and caused the dissolution of a community and heritage in the name of progress. This truly is a Baltic center with all three heritages utilizing the facility.

If the Latvian Center should close or be moved, the displacement will be to all three heritages and communities and to a center that is one of a kind not just in the Pacific Northwest, but in the United States.

Regards,
Daiva Dambrauskas

I-419-001

Thank you for describing the importance of the church and center to the Latvian/Baltic communities. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: In favor of B2A for Segment B

I-420-001

For Segment B which includes Mountlake Terrace, I'm writing to support alternative B2A, which serves both the Mountlake Terrace Transit Center and the "optional" station at 220th Street SW.

The Mountlake Terrace Transit Center is a significantly better station location than the Mountlake Terrace Freeway Station (alternative B4), due to its proximity to the business district of Mountlake Terrace, designated a Town Center in the city's official comprehensive plan.

The importance of the freeway station location will diminish over time as Link is extended to the north. The Mountlake Terrace town center, in contrast, will become increasingly important over time to this growing community that has been especially proactive in imagining a better future for its downtown. As it stands there is a bit of a walk between the transit center and the true town center; the location in the freeway median is too indirect for a significant population, especially the less abled, to consider "walking distance" from the town center, thus severely diminishing the synergies that town center will hopefully feel with the region at large once this Link connection is constructed.

Meanwhile, it would not make sense to omit a station at 220th St.SW, This area already has strong employment density and has the potential for significant residential and employment growth over time. This location is one of the points where I-5 and SR 99 are closest. Without a station at 220th St., a very long stretch would be underserved by Link, and a station there will yield many long-term benefits.

thank you,
Jonathan Dubman
2014 E Calhoun St.
Seattle, WA

1

I-420-001

Thank you for your comment stating your preference for the B2A alternative with the Mountlake Terrace Transit Station and 220th Street SW optional station. The Preferred Alternative is based on Alternative B2, but has an option for a 220th Street SW Station.

Subject: Impact on Latvian Center with Light Rail

I-421-001

I am a long time member of the Seattle Lithuanian Community. We have had many opportunities to use the Latvian Center over the years. We have been able to participate in weddings, funerals, fund raisers, cultural events, Lithuanian events, Latvian events, events including all three Baltic countries, and fundraisers for the programs at the University of Washington. The Latvian center is a special facility for us since it houses a chapel, a main hall with a stage and kitchen, and classrooms downstairs. My request is that during the construction of the rail line, that the center be allowed to stay open for us to use for our regularly scheduled events. It seems that an at-grade line would make the least amount of impact on the center. If we were to lose the use of the center, I don't know where we could go that would replicate what we have with the main hall, stage, kitchen, etc. I worry that the relocation of the center would be next to impossible for all of us who use it. The Latvian center was built at a time when economically, it was easier, and there were donation monies and labor that would not be available in this current day.

The Latvian Center is the focal point for all of the three Baltic Communities that use it. I hope that Sound Transit will do all in its power to see that the center stays open in the future and functions as it does today.

Geni Orrico

Subject: Light Rail

I-423-001

To whom it my concern,
I am a member of the Latvian Center next to I-5 that will be impacted by the extension of the Light Rail to Lynwood. I support Light Rail, but would it be possiblevery much appreciated if you could come up with a plan that would not disrupt or eliminate the Latvian Center.
I personally went to Latvian School in this building until the 10th grade. I was confirmed at the Latvian Church in 1980. I danced in the Latvian fold dancing group from 1988 - 1993. My son goes to the Latvian school for the past 3 years and will be going for the next 6years hopefully. I have a 22 month old who will start going to the preschool starting next year. My mom had here 80th birthday party at the Center. My grand parents and my fathers Memorial service was held at the Latvian Church/center.
Beyond a personal story, Seattle is enriched culturally by the presence of the Latvian community. There are only 2 million people in the entire world that speak the Latvian language. It is considered possibly the oldest spoken language in Europe. The other 2 ancient ethinc groups from Europe are the Lithuanians and Estonians. They also use the Latvian center for their community events. Seattle has bragging rights. The only University in the world that teaches Latvian, Lithuanian and Estonian is the University of Washington. That would not have been possible without a strong Baltic community.
Please work on a solution that will not disrupt the Latian Center.

Subject: Draft EIS Comments

Sound Transit:

I-424-001 Thank you for the opportunity to comment on your Draft EIS. I am enthusiastic about the light rail extension and would like for it to proceed once the implantation details are vetted with the community. Regarding the particular light rail route, I would like a stop in Shoreline near NE 175th or NE 185th Streets.

I-424-002 However, an existing transit operational deficiency in the area along this route needs to be considered in this EIS. With this route crossing county borders, particularly with each county served by their own bus transit systems, I am concerned that the overall transit plan overlooks the potential benefits of merging the 2 county's separate bus transit systems into a single entity. From the perspective of a reverse-commuter and one who works at a facility with the world's largest building and a huge commuting workforce, the regional transit is woefully inadequate today, and the alternatives in the draft EIS do not appear to address this shortfall or its role in the future. I live in Lake Forest Park and work at Paine Field in Everett. This deficiency should be addressed as an alternative in the EIS for a more technically complete comparison, and beyond just a what-if study, it could provide seamless bus service to greatly serve the community and reduce traffic growth with minimal incremental cost.

Such a single regional bus transit agency would realize efficiencies, provide missing cross-boundary transit services, and allow reallocation of existing labor and equipment resources. Specifically, this merger would include the Transit portion of Metro, Snohomish County's Community Transit, and perhaps Pierce County's Pierce Transit all under Sound Transit. Some cities have small transit services (e.g. Everett Transit) that may or may not join this merger but may readjust their routes to complement a re-organized regional transit authority.

This proposal comes from seeing nearly an estimated hundred or so empty dead-heading Community Transit (CT) or Sound Transit (ST) buses per week along my commute between Lake Forest Park and Everett, with the frustration that they are taking a route very close to my commute and I can't ride them! These are not just small buses, but the newer double-length or double-decker buses. Metro provides service toward Seattle and a milk-run towards Bellevue, but no service along the heavily traveled I-5 corridor, and certainly nothing worthwhile into Snohomish County. The CT and ST buses deadhead northbound in the morning out of Seattle and the Eastside to their two parking bases within a short walk of the Boeing plant with thousands of workers who commute from King County in their cars working in one concentrated location with virtually no transit service because of the jurisdictional boundary of the county line. In the afternoon, this process reverses with many buses deadheading south into King County. One of the subject CT bus facilities is at Kasch Park a couple blocks south of the main factory and the other is east of the engineering office buildings and buses pass through the main intersection that is closer to the building than most people can park their cars.

CT's goal is understandably to get Snohomish County residents into King County in the morning and back in the afternoon so stopping for other riders (like me) who live and pay taxes in King County is not in their direct interest and would slow down their buses' return to fetch more of their residents. Meanwhile, those of us within a couple miles of the county line in north King County live in a no-man's-land of bus practical service. Sure, Metro offers a small number of "custom buses" early to support a small number of factory workers but these are expensive because they go out of King County, run infrequently and are too early for many workers thus are not a viable commute approach for anyone needing the slightest flexibility in their work schedule. This leaves people in my situation not getting served despite paying taxes to support both Metro and Sound Transit.

In my daily commute of about 25 minutes each way, I'd estimate that I see nearly a hundred empty dead-heading buses each week (about 10 each way, 5 days per week = 10 x 2 x 5 = 100) so I'd estimate there are a more such dead-heading buses if I were to extrapolate my 25 minute commute samples out over the whole peak commute times. Although some ST buses occasionally have passengers, they are operated by CT with overlapping objectives thus not realizing their full potential as a regional transit solution.

1

I-424-001

Thank you for your comment stating your overall support for the Lynnwood Link Extension project and a preference for a light rail station at NE 185th Street. No transit station is being proposed at NE 175th Street. Please see Section 2.5.1 for a description of the alternatives and especially look at Table 2-1a. A station at NE 175th Street was previously considered, as described in Table 2-3.

I-424-002

Thank you for your perspective on regional transit service. The merging of transit agencies is not within the scope of this study; however, Sound Transit will work with King County Metro and Community Transit to develop/refine transit integration and detail service plans as this project progresses.

I-424-002 Merging these agencies would remove the jurisdictional boundaries along the county lines, which today are nothing more than arbitrary lines as far as commuters are concerned in our regional economy. All of these empty bus trips each week could be re-allocated to meet our growing transit needs and alleviate freeway traffic. Many more commute trips could be accommodated with no additional operating expenses for drivers or maintenance, and no new capital expense for buses. In much the same way that airlines or other companies merge to achieve efficiencies, such a merger of these constrained county agencies into a single agency is overdue.

For my commute, I would like to simply board a frequently-running bus at the new mid-freeway Mountlake Terrace Transit Center at SE 236th Street (which sadly is not used as it could be) and take it all the way to either Kasch Park or the intersection near the engineering buildings (but hopefully not nearly as many of these buses would be dead-heading any longer). I could reverse this process in the afternoon and even ride my bike between the transit center and home when the weather is cooperative.

Sincerely,

Steve Beland

To: Lynnwood Link DEIS
Subject: DEIS comments in support of a 130th street station

I-425-001

To Whom It May Concern,

I am writing to support a light rail station at 130th Street in Seattle as part of Lynnwood Link, with or without a station at 145th Street. These are the only options under consideration that allow for frequent and direct bus connections to the Bitter Lake Hub Urban Village and the Lake City Hub Urban Village in Seattle. These hub urban villages are an integral part of Seattle's Comprehensive Plan, which itself is integral to the implementation of Washington State's Growth Management Act, an act which also guides Sound Transit.

These urban areas are well established and fast-growing multi-use urban areas. They are served today by bus lines along their principal arterials (SR 99 and Lake City Way), including Sound Transit's own Express route 522, but these buses do not connect with Link, and these intensifying commercial and residential mixed-use neighborhoods lack good transit connectivity to the rest of the destinations on the Link system.

Neither 130th nor 145th has excellent transit-oriented development opportunities due to the effects on the walkshed of I-5, major arterial streets and nearby parks, which is all the more reason why bus connections are so critical at this location. Even if Seattle and/or Shoreline are willing to intensify development around 145th Street, that location is too far north to directly connect the centers of these two northerly urban hubs with connecting bus service without adding travel time and permanently boosting operational expenses. Traffic related to I-5 would impede reliability of east-west bus connections at 145th Street.

An added benefit of a bus line connecting Bitter Lake and Lake City to Link via the 130th Street Link station is the improved direct bus connection that will be created between these two urban hubs, a connection that is lacking today. A crosstown route in this area would create transit synergies via the network effect, given existing and planned transit investments along SR 99 and Lake City Way.

There may be reasons to site a station in the vicinity of 145th Street, but if there is insufficient will or funding to create a station at both 130th and 145th Streets, 130th should take priority due to its proximity and better transit connection opportunities to the largest urban hubs in the northern section of the City of Seattle.

Thank You,
Meghan MacKrell
6387 NE Radford Drive
Apt. #4124
Seattle, WA 98115

1

I-425-001

Your support for a 130th Street Station is noted. However, Sound Transit anticipates the Northgate and the NE 145th Street Stations would also be accessible to transit connecting to Bitter Lake, and Lake City hub urban villages, based on initial planning for transit integration between Sound Transit and King County Metro. The 130th Street Station is included as an option being considered in the Final EIS for the Preferred Alternative.

Subject: comments on Lynnwood Link Extension Draft Environmental Impact Statement

My comments relate to the impact of the Link extension on the Latvian Lutheran Church, school, and community center complex at 11710 3rd Ave Ne Seattle, WA 98125 (abutting the east side of I-5 between NE 117th and NE 120th St.

I-426-001 The proposed Link extension route passes through the west side of this property, removing the access road and requiring demolition of the caretaker's house. However, I strongly urge that the *entire* property NOT be taken for Link use. The church and community center are a reflection of the diversity of the Puget Sound area population, and serve important community enrichment and civil society functions *in situ* in the Northgate area. It would be difficult to recreate these social benefits at reasonable cost elsewhere, in part due to the relatively large size of the parcel and functions performed there, and in part due to the central and accessible current location.

I-426-002 In order to preserve the important and valuable civil society functions of the Latvian church/community center complex, I urge that Sound Transit make the following mitigations regarding the property:
1) Build one of the elevated options of Link north of 117th St (i.e. A3, A7 or A11).
I-426-003 2) Mitigate the train noise from the elevated section with a sound wall shielding the property to the east from train noise; make additional mitigations to the tracks, train speeds, etc, as necessary to further reduce noise.
I-426-004 3) Provide an alternate access driveway to the complex, either from adjacent properties to the southeast or northeast.
I-426-005 4) Compensate the center for taking the caretaker's house by building or paying for a new caretaker's house on or adjacent to the property.

Thank you for your consideration,
Armand MacMurray
1753 NW 57th St, #304
Seattle, WA 98107
armandjohn@earthlink.net

I-426-001
Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. A portion of land on the edge of the church property would still be acquired for the Preferred Alternative and other at-grade alternatives and the caretaker's house would need to be relocated.

I-426-002
While elevated options remain under consideration, the Preferred Alternative is at-grate, but avoids displacing the church.

I-426-003
The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below FTA criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Noise walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, if existing WSDOT noise walls are removed as part of the project, they will be replaced.

I-426-004
The Preferred Alternative redesigns the access street to the south.

I-426-005
Please see the response to comment I-426-001. Sound Transit would provide for the relocation of the caretaker's residence. As noted in

Section 4.1, any acquisition of property would involve compensation to the property owner in accordance with the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970; the Washington State property acquisition policies and procedures in Chapter 8.26 Revised Code of Washington (RCW); and Sound Transit's adopted Real Property Acquisition and Relocation Policy, Procedures, and Guidelines.

Subject: Please consider the following when choosing C1/C2/C3

Please consider the following when making a decision regarding the Lynnwood Light Rail C1/C2/C3 route alternatives.

I-427-001 It is well-known that the C1 alternative would (negatively) affect residential neighborhoods, along with the people who live in them. It is very difficult to put a price on the hardship caused by moving from a place you love, a place you call home - a place you chose to live because of its tranquility, beauty, and the quiet and serene setting. It is also fair to say this would be the case for many. Therefore it would not make any sense to assume that ***some would purposely look forward*** to the unneeded and unnecessary intrusion of the Light Rail Link to snake through our neighborhood, and displace many residents if the C1 alternative is chosen. Yet this is precisely the case!

The C1 alternative, if chosen - will seek to acquire the Cedar Creek condominium complex to make way for the Light Rail Link. This is a privately-owned complex, one that many of us call home, and one that would be acquired in its entirety. It would be logical to think that all the people who live in the Cedar Creek condominium complex would be firmly against the C1 alternative from being chosen. Yet a very small number of residents, ones who reside here, and call this place home - are for the C1 alternative. Why do you ask?

We all know that in 2008, our economy suffered a tremendous negative growth. It was at this precise time that some of these people bought units in the Cedar Creek condominium complex. Naturally, prices paid were much higher than the actual value of the units, and after a few years, these units were labeled as "under water" (price paid is less than what it is worth now.) When Sound Transit released the C1 alternative as one of the possibilities - these people saw the C1 alternative as a way out of their poor financial choice. I find the fact that these people would choose the C1 alternative only because Sound Transit would offer to purchase their units utterly unethical, extremely selfish, and simply inhumane.

I-427-002 The vast majority of our community is against the C1/C2 alternatives since they so negatively affect us, our beautiful and beloved Scriber Creek Park, and the overall tranquility of our serene neighborhood. The vast majority of our community therefore wishes for the C3 alternative to be chosen by Sound Transit Board. We have more than 1800 signatures to show this to be the case. It is therefore only

I-427-001
Thank you for your comment stating your opposition to Alternative C1 due to displacement. Please see Section 4.1 for details on mitigation.

The Preferred Alternative evaluated in the Final EIS is a modified version of Alternative C3, which would avoid displacing residents at the Cedar Creek condominiums. However, if Alternative C1 is selected to be built, Sound Transit will compensate property owners affected by the project; see Section 4.1 of the Final EIS for property acquisition mitigation.

I-427-002
Thank you for your comment stating your opposition to the C1 and C2 alternatives due to the adverse effects on Scriber Creek Park, displacement of adjacent residents, and intrusion into the heart of the neighborhood.

I-427-002 natural for me to ask you not to consider the comments of these people for any financial gain reasons they may forecast. If there are any valid reasons they have for the C1 alternative, consider them instead.

Sincerely,

Gleb Shein

Comments can be about anything related to the project, ranging from giving an opinion or observation to discussing technical aspects of the environmental analysis. The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

Comments

I-428-001

It is really painful that with Lynwood Link Extension just a straight line is made without regard to destroying the Community Center and the Church for all the Baltic countries (LATVIA, Lithuania and Estonia). They already have a painful road in history – so, the center served as a connection to their countries, culture and kids were able to learn the language and rich history and culture.

SOUNDTRANSIT
RIDE THE WAVE

I-428-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Fw: Lynnwood Link

To Whom it May Concern,
I am a resident of South Lynnwood one block west of the proposed Lynnwood Link route for C1 and C2. I am opposed to these proposed routes for the following reasons;

I-429-001 C1: - C1 is the most invasive and disruptive route of the three. It would take out far too many homes, displacing many Lynnwood residents. This route would completely change the dynamic
I-429-002 of quiet neighborhoods, and potentially ruin an F4 designated wetlands.

C2- - C2 is even more harmful to the valued wetlands and park. This plan would destroy the wetlands and endangered wildlife. The park would never return to it's current pristine condition.
I-429-003 It would also bring the train through quiet neighborhoods needlessly and take out a large engineering complex which employs over 100 employees.

I-429-004 C3- Is definitely the least damaging route for the local residents and the wildlife of the wetlands not to mention keeping the spirit of Lynnwood conservation alive. You see we are more than just a mall and a freeway exit. We are a thriving harmonious group of diverse neighborhoods, small businesses, ethnic restaurants and civic minded people.

I urge you to select option C3 as the route for the Lynnwood Link.
Thank you.

Devv Anderson
5308 202nd Pl SW
Lynnwood, WA 98036
206-261-4605

I-429-001
Your opposition to Alternatives C1 and C2 is noted.

I-429-002
In Segment C, Alternative C3 and the Preferred Alternative would have the least impact on the Scriber Creek wetland complex. Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts on environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure no net loss of ecosystem function and acreage as a result of agency projects.

I-429-003
Comment noted. Section 4.4 of the Final EIS evaluates the project's potential impacts on neighborhoods. Section 4.1 discusses potential displacements.

I-429-004
Thank you for your comment stating your preference for Alternative C3.

Subject: 145th/155th station

I-430-001 After talking with a few neighbors, we submit that a light rail station at 145th would be better than one at 155th Street. But, we do NOT want a parking garage built at either site as it would be extremely disruptive to the flow of traffic throughout our neighborhood. We believe that Sound Transit should NOT be building parking garages--they should be focusing on public transportation, NOT private automobiles. Instead of spending millions of dollars to buy land, force people out of their homes and build a massive concrete structure, that money would be better spent improving and expanding bus services to the light rail station. If someone feels they need to drive to a light rail station, then they can freely drive to Mountlake Terrace or Northgate and catch the light rail there.

I-430-002 Whatever station is built, we also feel it is important to design it in such a way that there are easy and quick connections to bus routes. Having to walk too far in the wind and rain to transfer would make many people not want to take the time for public transportation.

I-430-003 Again, we stress that we do NOT want a parking garage in the Ridgecrest neighborhood and will actively campaign against it as well as any city council member who advocates for it.

Thank you.

Your Ridgecrest Neighbors

1

I-430-001

Your preference for a 145th Street Station is noted. The proposed station with a parking facility addresses a need for good multi-modal access serving the needs of the region as well as local communities.

I-430-002

The station includes areas for efficient connections to transit routes feeding the station. Multimodal connections to stations will be refined in coordination with partner transit agencies and local jurisdictions in the Final Design phase of the project. Appendix F of the Final EIS contains the conceptual plans for the project.

I-430-003

Your opposition to a parking garage is noted.

Subject: Proposal of NE !45th Station

Planners,

I-431-001 Any combination of sites that would include 145th, is a waste for Sound Transit. A station there would fail from the start and then negatively impact other stations and ST in general. This I5 on/off corridor is already an over worked location and adding ST, Metro and mass parking will not change that location as the #1 choice for most north east (Lake Forest Park, Kenmore, Bothell, N. Kirkland) commuters that want to drive south on I5.

Please contact WADOT for their input concerning this site.

Thank you.

Dennis Barrett

1

I-431-001

Thank you for your comment stating your opposition to a light rail transit station at NE 145th Avenue. Traffic analysis was conducted for the operations of local streets for multiple modes of transportation. Section 3.2 of the Final EIS evaluates potential adverse effects the light rail transit station would have on highway access, local street capacity and level of service, and pedestrian and bicycle facilities. Where negative impacts would affect any of these modes of transportation, mitigation measures have been proposed in Section 3.6 to ensure there would be no deterioration in operations compared to future No Build conditions.

Subject: Sound Transit DEIS / Comments c/o Lauren Swift

Dear Sound Transit Board members,

I-432-001

Hello. I am very excited for the light rail system and the ability to walk to a light rail station from my house. I do have legitimate concerns over the Shoreline City Council's recommendation for the light rail station and parking structure to be placed at 145th St. (SR-523) and I-5. The Shoreline City Council is not discussing the reality of the conditions of traffic on 145th Street, or the 130th/155th St. options with WSDOT, Sound Transit, or the community.

The intersection where it would be placed (145th St. NE and I-5) is already a highly congested area. According to WSDOT, the intersection and the stretch of NE 145th St. surrounding it is already, in their words, over-capacity. Adding another destination focal point can only cause more congestion.

There are a couple of contributing factors to this, including, but not limited to:
* It is the only complete set of I-5 on and off-ramps between Northgate and 175th St. NE.
* There is minimal queuing area for the cars to enter the I-5 on-ramps. Which creates backups on 145th St. east and west of the intersection and in-between on the overpass bridge. This, in turn, creates backups on the I-5 off-ramps.
* It is a main arterial to I-5, that receives the bulk auto traffic not only from Shoreline neighborhoods, but also from Haller Lake, Greenwood, Aurora, Lake City,Bothell, Woodinville, Pinehurst, Lake Forest Park, Kenmore, and east-side traffic.
* According to WSDOT, traffic increased 11-15% on NE 145th St./SR-523 after the 520 bridge was tolled and people started using it as the connector around the north-side of the lake to I-5.

Currently, 145th St. east and west of the I-5 intersection during morning and evening rush-hour has two-lane 1/4 to 1/2 mile backups of cars waiting to go northbound and southbound onto I-5. One of the major problems is there is no good way to mitigate the issues of a light rail station on 145th. Some of the ideas floated are:
* Add complete sets of off and on-ramps at 130th and 155th St, to reduce the influx of vehicles that use 145th. St solely for the purpose of I-5 access. (which WSDOT says it will not do)
* Acquire hundreds of folks properties to widen the 145th arterial, in some instances this would place a state highway within feet of Seattle and Shoreline folks' front doors, or directly in the path of current homes. There is also current infrastructure and or protected spaces in the immediate vicinity, such as a pumping station, Thornton Creek, and the Jackson Park Golf Course.
* Add direct on and off-ramps to the station and parking structures from I-5.

I-432-002

When I asked the Shoreline City Council how they plan to address this, or if they have worked with WSDOT to address these concerns, I receive blank stares and replies along the lines of "WSDOT will mitigate any issues". When I asked WSDOT if they had an official position, they said they had not released one but would be more than happy to talk to Sound Transit about the facts. I encourage you to speak to the WSDOT planners and employees who control this area.

I-432-003

I have been to multiple Ridgecrest community meetings, and to the majority of the folks in the effected neighborhoods it makes much more sense to have the proposed two stations at 130th St. and 155th St. Some contributing factors supporting this are:
* The already over-capacity and congested NE 145th St. arterial.

1

I-432-001

The Draft EIS included the results of the traffic analysis conducted for the operations of local streets for multiple modes of transportation, including at NE 145th Street, along 5th Avenue NE, and the on and off ramps and adjacent sections of I-5. Several of the alternatives, including the Preferred Alternative, revise the on-ramp and include features to help move traffic through the area and address queues. This includes turn lane additions, intersection modifications, and new signalized intersections. Section 3.2 of the Final EIS defines the potential adverse effects the light rail transit station alternatives would have on highway access, local street capacity and level of service, and pedestrian and bicycle facilities. Where negative impacts would affect any of these modes of transportation, mitigation measures have been proposed in Section 3.6 to maintain operations at least as good as No Build operations. The analysis does not reveal that the project would notably alter operations on I-5 or increase the volume of vehicles using the I-5 on or off ramps, in part because the interchanges in this area are limited, and because a potential transit patron trying to access light rail via I-5 would have other light rail stations closer to where they would start or end their trip.

I-432-002

Sound Transit and FTA have been working with WSDOT, Shoreline, and area agencies since the start of early scoping for the project alternatives analysis in 2010. WSDOT is a cooperating agency for the Lynnwood Link Extension project and has been extensively involved. As a cooperating agency, WSDOT has jurisdiction by law or special expertise with respect to transportation related impacts involving the interstate.

I-432-003

Thank you for your comment providing a detailed list of reasons for your preference for new light rail transit stations at NE 130th and NE 155th Streets and your opposition to a light rail transit station at NE 145th

I-432-003

* 130th is an arterial from Greenwood/99 to Lake City, but currently does not have the congested traffic that 145th St. does.
*155th is an arterial from Greenwood (via turning into Westminster Way, which turns into Greenwood), Aurora/99, to 15th Ave. NE
* The more stations a mass-transit system has, the more people will have access to it, and more people will use it. The two stations, 130th and 155th St. would server a greater amount of citizens and provide access to more light-rail riders.
* Two stations will split the traffic, and if applicable, the parking between two stations.
* It will allow people to access the stations from 130th(125th&Roosevelt&130th), 145th, and 155th (All of which are East/West arterials).
* 155th St. and 130th St. both have designated bike lines. 145th Street does not have a bike line, and is not safe for bicycle traffic.
* 155th St. and 130th St. both have newer accessible sidewalks. The 145th St. and I-5 intersection is not very walkable, nor accessible. The sidewalks, where they exist, are not accessible.
* It creates easy light-rail access not only for the Ridgecrest and Parkwood neighborhoods, but also for Lake City, Pinehurst, Bitter Lake, Haller Lake, Olympic Hills,and Broadview.
* This will free up the East/West arterials for the crosstown bus routes to feed the stations.
* Less, if any at all property and homes would need to be acquired. The property around the proposed 130th St. and 155th. St. stations are owned by the municipalities.

If you can, please visit and observe the congested NE 145th St. and I-5 intersection during morning or even rush hour. You will see how wanting to place a light rail station at 145th St. is very troubling.

Thank you for your time.

Ryan Basile
921 NE 146th Street
Shoreline, WA 98155

Street. Please see Section 3.2 in the Final EIS for updated discussions of both long-term adverse transportation effects compared to the No Build Alternative and the updated list of potential mitigation measures in Section 3.6. Please note that the Preferred Alternative includes localized bicycle and pedestrian improvements, and safety and operational improvements.

Subject: Save the Seattle Latvian Lutheran Church

To whom it may concern:

I-433-001

I am writing to you to in hope that the Seattle Latvian Lutheran Church and Latvian Center can continue to operate normally during and after the Lynnwood Link Light Rail construction.

I was born and raised in the Seattle area and grew up a part of the Seattle Latvian community. Due to my career and studies, I moved out of state and overseas for about 14 years and one of the primary reasons I chose to return to Seattle was due to its strong Latvian community. Both of my parents immigrated to the US after WWII and eventually settled in Seattle. My life revolved and continues to revolve around the Latvian center and church: I attended and graduated from our local Latvian school, attended Latvian church for as long as I can remember, danced for many years with the Seattle Latvian folkdance group Trejdeksnitis and even ended up marrying a Latvian from Latvia, who now lives with me in the Seattle area, along with our two young children, who both speak Latvian and attend Latvian school each week. I am part of the Latvian church's board and an active church member. The Latvian church and Center is a place of worship, learning and also a place to meet old and new friends.

I'm very concerned if the Center and church were to relocate as it could really impact my family's ability to participate in the Latvian community, especially if our commute increased significantly or if the new facility was not at least equivalent in size and quality as our current facility. Moving could eventually lead to the collapse of our Latvian community if other members aren't able to regularly participate in the church and Center's activities.

Our Latvian church and Center has already been forced to relocate once before and it seems hardly fair to ask us to relocate again, especially given the number of people who have chosen to live in the current location's vicinity and the extent the Center revolves around our lives. It has always bothered me that my parents could not christen me in our own Latvian church as I was born shortly before the current Latvian church was built and after the previous Latvian church was razed to make way for a park. My children were christened in our current Latvian church and I hope that when they have kids, they can elect to christen and raise their kids in our church as well.

I-433-002

As my family's life revolves around the Latvian church and Center, I feel strongly that we need to have uninterrupted access to the current location during and after construction of the Light Rail. I pray the train's path can be altered to avoid any impact to us, but if that's impossible, please build the train at grade level to minimize the impact (view, noise, hopefully vibration, etc.) to our Center's regular operation.

Thank you,
Martin Berzin
(425) 420-7495

1

I-433-001

Thank you for describing the importance of the church and center to you and your family. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-433-002

Access to the church would be maintained during construction. The Preferred Alternative identified by the Sound Transit Board is at-grade adjacent to the church. The project will include design and mitigation measures to minimize visual impacts (Section 4.5 of the EIS). The project will include mitigation to reduce noise and vibration below FTA criteria.

Subject: Save the Seattle Latvian Lutheran church and Center

To whom it may concern:

I am providing my comments regarding Sound Transit's plans to build the Lynnwood link.

I've been living in the US for about 6 years and just returned from a trip home to Latvia and realized that I wouldn't feel as comfortable living here without our Latvian community that's been going strong for so many years mainly thanks to the Latvian Center and Latvian Church. It fulfills my need for Latvian culture and language, something that I never really thought about in the past. I've met a lot of friends at the Center – Latvians that were born here and those that have moved here from Latvia. Both of my children regularly attend the Latvian school and I hope that thanks to that they'll grow up truly bilingual. We have quite a lot of things happening in the Center throughout a year – several bazaars a year, different events during Christmas, Easter, Summer Solstice etc. Theater from Latvia visits our Center several times a year and that's especially important for me personally.

I-434-001 Losing the Latvian Center would really impact me and make it more difficult to feel at home here in Seattle as it's a big part of my life. Moving the Center to an inconvenient location would have a huge negative impact on our Latvian community as so many of us have chosen to live in the Center's vicinity and wouldn't be able to remain an active part of the community, which could lead to our Latvian community's eventual collapse. We need our Latvian church and Center to remain at its present location and have its doors open, even throughout the Light Rail's construction period. I'm really concerned that the dust, vibration, noise, access issues and view of the train (especially if it's elevated) will negatively impact our regular church and Center activities.

Thank you.
Sandra Berzina

1

I-434-001

Thank you for describing the importance of the church and center to you. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the edge of the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describing the acquisition impacts; Section 4.4 describing impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including portions of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

Access to the church and center will also be maintained during construction.

Subject: Latvian Community Center - Light Rail

Importance: High

Dear Lauren Swift & Sound Transit,

I am by blood lines, not Latvian. However, I am in my heart and soul a Latvian. I married my wife Ruta in the Latvian Church on May 17th 1986. Our son, Aleksandris was baptized there and attended Latvian School each Saturday for many, many years. The community center is the heart of the community and we Latvians are the blood. One without the other is not possible.

In the 30 years I have been a part of this community it is the Church and Center that has been the example of what the Latvians wished their country to be: Free, open, democratic and safe. The Country of Latvia now has these rights, in part, due to centers like this where ex-pats were able to gather, discuss and even vote for change in their home country.

I-435-001

Many of the Latvian elders have moved to neighborhoods near the Latvian Church so they may be close to those they care most about and to be able to be a part of this very special community. To displace the function, the Baltic communities that know this place as a sanctuary, would be to essentially disband the community and send them adrift in a sea of uncertainty…like they were in World War 2 and in 1969 when the church was forced to relocate previously. In 1969 the community was much smaller, but just as tight and as important as it is today. However today, the Church and Community has grown to a size that would making it extremely difficult to move and have it survive for those it serves.

For the record, I am a huge supporter of Light Rail. Having lived in, and traveled throughout Europe over the years I know how important this is to our community in so many ways. I want to see Light Rail succeed.

I do not envy you and your team in this process of evaluating the best solution. What we do need is a solution that will be the best for all involved, and that would have to include the Latvian Church and property staying there and available to its members and friends as it has for so many years.

Thank you for the work you do.

Warm Regards,

Jim Biteman

Subject: comments on DEIS

I reside at 20314 5th NE in Shoreline WA. I am both excited and concerned about the siting of stations at 236th SW and 185th NE.

I-436-001

Living just outside the impact rings drawn by both station plans I would like to urge your team to consider the possible ramifications of the design of either of these stations on the families living along 5th NE. I would like the impacts of the siting both stations to be considered concurrently as a whole and not separately. 5th AVE NE is the closest through street on the west side of the freeway and I assume traffic will increase as ridership increases. Myself and about ten residences face 5th and are outside the half-mile zone that is in consideration for planning of the two stations. I am concerned that the impacts will be considerable if proper planning for alternative routes to and from the stations are not addressed. Currently the neighborhood in which I live (Northridge) is isolated by 205th NE to the north and I-5 to the east. The site planning for the station at 236th SW should address pedestrian and automobile access from the south for this area and the commuters from Lake Forest Park to help mitigate turning 5th NE into the major access route from 205th NE. I recall all to well the diversion created when the carpool and traffic flow regulation signals were installed. The time to get this right is now during planning. I do not want to see my street turned into a thoroughfare for commuters. This was and still is a neighborhood and planning should take into account the human scale impacts. Our neighborhood has had to absorb much of the noise, congestion and aggravation of the increased traffic moving down I-5 without much in the way of return. I would hope that this project would consider the historical impacts and seek to minimize the effects of this new stage of transportation development

Thank you for your time,
Sincerely
Wes Brandon

1

I-436-001

It is anticipated that 5 to 10 percent of the trips accessing the 185th Street Station would drive on 5th Avenue NE, which translates to 25 vehicles or less in the morning (AM) or evening (PM) peak hour. This is a relatively small addition to the traffic already using the facility. Chapter 3 of the Final EIS describes potential impacts and identifies mitigation measures in Section 3.6.

Subject: Preserve the Latvian Center

Folks,

I-437-001 I am glad that Light Rail will be extended but I hope that you can arrange to preserve the functionality of the Latvian Center and church. This facility serves as the hub, not just for the Latvian Lutheran congregation, but for the extended cultural communities of all of the Baltic countries in Washington State. For the past 30 years, I have been learned much and met many people representing Lithuanian, Estonian, and Latvian communities at the Latvian Center. We have celebrated our respective independence days, held schools for our children and fund-raising and cultural celebration events, and come together across the three communities in ways that only a large facility of this sort permits. These events and the school that is held there are key links in nurturing and preserving the culture and language of these communities. This is where we come together to sing, to dance, to pray, to honor our heritage, and to support each other as we move forward.

Please work out ways that the center can remain open and functional during construction and will retain as much access and parking as possible after construction is completed.

Sincerely,

Steven L. Buck
Treasurer,
Lietutis Lithuanian Dancers

To: Lynnwood Link DEIS
Subject: Latvian Lutheran Church

To whom it may concern:

I lived in the SF Bay Area when BART first opened and have ridden it periodically when I return to visits. I applauded the Seattle area finally getting a rapid transit system and voted for it many years ago and look forward to it being up and running sometime in my life time...maybe even along the I-405 corridor as well.

Imagine my dismay when I found out the light rail was going to adversely affect the Latvian Lutheran Church! This church has been an important part of my family's life since I married my Latvian husband. When my husband's parents were still alive, we would take my them there for senior citizen club and to watch my father in law perform in plays.

After we had our children, Latvian Saturday school became part of our lives. Our daughter was confirmed there and danced on Sunday evenings with the Tredekitnis dance group. I learned both Latvian cooking and Latvian sewing there. We look forward to annual Latvian bazaar each November.

I-438-001 I don't understand why you think it would be okay to affect our cultural center by building your light rail on the east side of the freeway. It seems like you could move the light rail on the west side of I-5 instead with less impact on communities.

Thank you-
Nancy Celms

1

I-438-001

Thank you for describing the cultural importance of the Latvian Evangelical Lutheran Church. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. Subject: Latvian Community Center

I-439-001 I am writing to voice my dismay that the light rail train will run right past my community center. I deeply wish that the train could run along the west side of the freeway. I feel like that would spare us and other families and communities from much distress.

I-439-002 Understanding that Sound Transit has moved ahead with its planning with the line running along the east side of the freeway, I hope that a ground level option will be selected. In addition, I hope that a sound barrier will be build to protect my community center from noise disruption and that

I-439-003 our caretakers' home will be replaced. It is necessary for us to have continuous access to the community center throughout the construction process so I hope that will be taken care of as well.

Thank you for your time,

Sara Celms

1

I-439-001

Thank you for your comment stating your concerns about impacts to the Latvian Evangelical Lutheran Church. The Preferred Alternative is at-grade, but all alternatives now avoid displacing the church and hall. During early project planning, a broad range of corridors and alternative alignments were considered. The results of this analysis are found in the Alternatives Analysis Report and described in Chapter 2, Section 2.6.

I-439-002

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Noise walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts.

I-439-003

Although current designs show the caretaker's residence needs to be relocated, Sound Transit would provide for the relocation, as described in Section 4.1. Access to the church and hall would be maintained during construction.

To Whom It May Concern,

I-440-001

I am writing as a Seattle resident to express my support for regional light rail. and, in doing so, to urge Sound Transit to do right by a longstanding community organization that has been unduly disrupted by our civic decisions and needs over the years. The Latvian church and community center plays an irreplaceable role in the lives of many people in our region, and a solution that allows them to continue to operate as a place of worship and an essential cultural gathering place must be found.

It was a pleasure to read in the local paper today that the President of Latvia was visiting on a trade mission. I am sure you appreciate how extraordinary it is for a visiting head of state to decide to weigh in on a local civic matter. He clearly understood how very critical it is for emigres to have a place that connects them to their culture and personal history. That is especially true when the reason for their emigration was to escape an invading regime that represents a world view that we as Americans have a long tradition of trying to contain in the

To: lynwoodlinkdeis@soundtransit.org

Dear Sir or Madame of Sound Transit,

I-441-001

My family and I are very distressed by the thought of and disruption of the Latvian Center. This is a massively important place for us as we use the facility at least twice a week by us from school to church. It is the only location that is offering language for my children. I met my wife there baptized my family buried my grandfather... This has been for the past 40 years a huge part of my identity.

The significance of this facility has a massive historical significance to the Lavian community as it was raised by refugees of the 2nd world war. During the 50 years of occupation the Latvian culture and people have been almost completely destroyed. Most of the population does no longer speaks the language or knows the culture. Facilities like this one in Seattle USA provides a beacon of hope of what the country could be again. Relocation again will be dangerous as we will loose more members as proven by history.

Latvian come to visit center and go to the local Universities. The local community center raises money yearly for the University of Washington thru donations and rummage sales. The donations support the Baltic studies program. With out the center we would risk loosing the yearly efforts and capital needed to fund the Baltic studies program.

Thank you,

Michael

Thank you for taking the time to review public input on the DEIS.

I represent a number of homeowners on the east side of the freeway in North City in the likely future station area.

I-442-001 We believe that the best way to distribute the impact of a Light Rail station at 185th is to have the parking structure on the West side of the freeway adjacent to the current parking lot at Shoreline Stadium---that is part of **Option A1**. This parking structure would not displace any houses and would divide the impact of Station East side - Parking structure West side.

A short walk from the future station - (much shorter than the walk from parking garage to current busses at the Mountlake Terrace Transportation Center) - the parking structure in this location also better serves the bulk of Shoreline traffic/population from the west side of the freeway via Meridian and 185th - as well as connecing to 200th via 5th avenue. Another future overall benefit of the structure being in this location would be to provide addtional parking for events at Shoreline stadium and Shoreline Center, (depending on its future use for light rail drivers - being first priority).

I-442-002 The other key component of the benefits of **Option A1**, is that it is At Grade with less noise and visual impact to the neighborhood. This is very important to the home owners east of I-5 in the station area. This would also be a cost savings to the project as all of the options North of 185th (The Section of track from 185th to approx. 200th are At Grade.) The line could have almost all of the section from just north of 155th up to 200th At Grade! (besides the need to elevate over 175th intersection). Actually from 117th - 200th.

I-442-003 Regardless of what happens in terms of stations south of 185th - please be flexible and fluid in the design plans to consider these suggestions. The garage at 185th could be west of the freeway AND this section could be At Grade - regardless of some of the plan details that transpire to the south - stations and sections. Please take a mix/match approach and don't just stick to the options as presented. These parts of **Option 1A** could be mixed with the 'best' parts of sections south.

- Spread the impact of the station on the neighborhoods around 185th - Put the Parking structure, tucked into the hill along side the west side of the freeway.

1

I-442-001
Thank you for your comment stating your preference for layout of the parking garage at the proposed light rail transit station at NE 185th Street.

I-442-002
Thank you for your comment stating your preference for an at-grade alignment. The Preferred Alternative is mostly at-grade in Segment A.

I-442-003
In the Final EIS, the Preferred Alternative includes a station at NE 185th Street to the north of NE 185th Street and east of I-5. The parking garage would be located on the west side of I-5. Please see the Final EIS Chapter 2 Alternatives Considered for more detail on the Preferred Alternative.

Options to extend the station south were not advanced because the station requires a straight section, and the area to the south would not accommodate the station without more impacts.

I-442-003 - Please put the Line At Grade! Less noise, less visual impact and the opportunity for cost savings to have long sections of track At Grade from 117th to almost 200th!

- Please consider the idea of moving/streching the station - just a bit south - to utilize the relatively large section of unused property just south of 185th between I-5 and 5th Avenue. If the station were to 'straddle - strech' under the 185th street bridge - it would make better use of the available space, could provide access to the station without having to cross the street (185th) and could hopefully make better use of the available footprint - decreasing the impact on the neighborhood. Please investigate using this section of available land for the Final EIS and design plans.

I-442-004 - Please continue to work with the City of Shoreline to measure the impact a station will have on drivers cutting through North City from Lake Forest Park.
Perkins Way and NE188th are narrow, low visibility, blind turn streets that will need study and mitigation. 185th in the Station area is a minor arterial that does not connect to 15th or 522 to the East.

- Please work with the City of Shoreline to slow down traffic in the station area, making it Pedestrian and Bike focused - with good, well lit, safe covered walkway from the garage and consider dropping the Speed Limit around the station area to 20-25mph. We must all work to slow traffic down in this area.

I-442-005 - Please contiue to work with the City of Shoreline to emphasize how to be succesful in putting a Light Rail station into a neighborhood with minimal current (or future) opportunity for T.O.D. Sound Transit does not need T.O.D. at 185th for the Lynnwood link to be successful and meet ridership goals!
By providing a parking garage, Buses connecting from Aurora Avenue, the Aurora Transit station near Costco and to North City - the station and the line can be successful without having lots of T.O.D. The city of Shoreline has gone beyond painting the picture of an "opportunity" for the city and have instead described the "requirement of T.O.D." when this just simply is not the case. 185th is unlike any other station currently on the Rail Line (or future stations). It is NOT on a major arterial, like 145th or 175th or 130th, or MLK Way. It is NOT in an area of already up-zoned w/commercial like on Capital Hill, the U-District, Northgate or Beacon Hill. It is NOT like the huge footprint opportuniy at the Mountlake Terrace station with the current garage or future commercial development south of there along the freeway.

What 185th IS is an opportunity for a carefully designed - neighborhood station - unlike anywhere else on the Sound Transit line. Though there may be some change with some controlled development over time - everyone needs to approach the success of the station and its impact on traffic and the existing neighborhoods with the idea that T.O.D. might not happen for quite some time - and needs to be planned very carefully. (This onus falling on the City of Shoreline of course).

2

I-442-004

The Final EIS Section 3.6.5 identifies mitigation measures to discourage station-related cut-through traffic. All the stations will have pedestrian and bicycle facilities to support and encourage use of those modes. Stations will be designed with safety in mind; see Section 4.14 of the Final EIS for the safety analysis.

I-442-005

Thank you for your interest in Lynnwood Link Extension and your comment regarding TOD and the NE 185th Street Station. The City of Shoreline developed a subarea plan near the proposed NE 185th Street Station that may permit some commercial development and higher density housing near the station. The subarea plan also addresses other aspects of the neighborhood including public spaces, recreation, and access.

Thank you for taking the time to read, incorporate and respond to public input.

Best regards,

Dan Dale

Subject: Lithuanian community member on behalf of Latvian Center

I am a member of the Lithuanian-American community that regularly uses the Latvian Educational Center that would be impacted by the new Sound Transit railroad plan.

My family attends events at the Latvian center often, including:
- folk dance rehearsals for my 10 year old daughter
- singing rehearsals for my 7 year old son
- February 16 independence day celebration every year where the kids perform, the community gathers, and many congressmen and other dignitaries attend
- St. Martin's Eve party to celebrate Halloween Baltic-style!
- Spring fundraising event for the Lankas Lithuanian youth summer camp
- Lithuanian school events, which both of my children attend
- And plenty of other events and parties throughout the year...

I-443-001 I urge you to do whatever is possible to maintain access to the Latvian Center during construction, and to make it possible for us to use it productively throughout that time, with a similar amount of parking and some reasonable access both during and after the train is

I-443-002 built. It appears that the at-grade option would likely be preferred for our needs, to minimize noise impacts long term.

I-443-003 Many people have reorganized their schedules, lives, even where they live based on the location of this important community building for the entire Baltic community. Relocating the Latvian Center would be a major disruption, and for many, this building holds special memories and sentimental value that cannot be replaced.

Thank you for your consideration!
austina

Austina De Bonte

I-443-001

Sound Transit plans to maintain access to the church property during project construction. Details of construction access would be defined in coordination with the church after the publication of the Final EIS, during the final design and construction planning phase.

I-443-002

Thank you for your comment. Noise walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts.

I-443-003

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Lynnwood Link DEIS comments

Dear Lynnwood Link,

I have carefully read the DEIS and have watched the September 13th Tech Talk. I am looking forward to the completion of the Northgate to Lynnwood segment of the Link. Please consider the following comments:

I-444-001

1. As a resident in the Haller Lake neighborhood, I am in support of the at-grade option in the segment from Northgate to 130th, along with careful mitigation of noise pollution through use of sound walls. At-grade choice is preferred to minimize the negative visual impacts and to preserve the residential landscape. As a resident of the area, noise pollution from I-5 is already an issue, and we would appreciate your help to minimize further addition to noise pollution. As for visual impacts, we are a quiet residential neighborhood where many homes are single story structures. Having an elevated track would be a bit of an eye-sore. Furthermore, I did not see any indication in the DEIS referring to adequate noise mitigation in elevated options. My worry is that an elevated track will only allow the noise to travel even further, affecting more people, inside or outside of buildings.
2. I support a station at 130th in segment A.

I-444-002

3. Please consider putting in less infrastructure for cars and more infrastructure for bikes (including bike parking and safe bike lanes to reach stations).

Thank you for considering our needs and preferences. Please do not hesitate to contact me if you have any questions.

Sincerely,

Pieter De Temmerman

1

I-444-001

The noise analysis for the Lynnwood Link Extension uses the FTA impact criteria and Sound Transit's policy is to mitigate moderate or severe impacts under FTA criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Noise walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. The visual impacts of the project are evaluated in Section 4.5 of the EIS.

I-444-002

The park-and-ride facilities have been sized to accommodate a balance between forecasted parking demand and minimizing potential impacts created by the facility. Stations will include pedestrian and bicycle facilities.

To: Lynnwood Link DEIS
Subject: DEIS comments supporting a Link station at 130th Street

I-445-001 I'm writing to support a light rail station at 130th Street in Seattle as part of Lynnwood Link, with or without a station at 145th Street. These are the only options under consideration that allow for frequent and direct bus connections to the Bitter Lake Hub Urban Village and the Lake City Hub Urban Village in Seattle. These hub urban villages are an integral part of Seattle's Comprehensive Plan, which itself is integral to the implementation of Washington State's Growth Management Act, an act which also guides Sound Transit.

These urban areas are well established and fast-growing multi-use urban areas. They are served today by bus lines along their principal arterials (SR 99 and Lake City Way), including Sound Transit's own Express route 522, but these buses do not connect with Link, and these intensifying commercial and residential mixed-use neighborhoods lack good transit connectivity to the rest of the destinations on the Link system.

I-445-002 Neither 130th nor 145th has excellent transit-oriented development opportunities due to the effects on the walkshed of I-5, major arterial streets and nearby parks, which is all the more reason why bus connections are so critical at this location. Even if Seattle and/or Shoreline are willing to intensify development around 145th Street, that location is too far north to directly connect the centers of these two northerly urban hubs with connecting bus service without adding travel time and permanently boosting operational expenses. Traffic related to I-5 would impede reliability of east-west bus connections at 145th Street.

I-445-003 An added benefit of a bus line connecting Bitter Lake and Lake City to Link via the 130th Street Link station is the improved direct bus connection that will be created between these two urban hubs, a connection that is lacking today. A crosstown route in this area would create transit synergies via the network effect, given existing and planned transit investments along SR 99 and Lake City Way.

There may be reasons to site a station in the vicinity of 145th Street, but if there is insufficient will or funding to create a station at both 130th and 145th Streets, 130th should take priority due to its proximity and better transit connection opportunities to the largest urban hubs in the northern section of the City of Seattle.

thank you,
Jonathan Dubman
2014 E Calhoun Street
Seattle, WA 98112

I-445-001
Your support for the NE 130th Street Station is noted. The 130th Street Station is included as an option to the Preferred Alternative in the Final EIS.

I-445-002
Thank your for your comment regarding the applicability of walk sheds and light rail stations. Sound Transit developed a walk shed and bicycle shed analysis for each station and identified barriers to each station. As you mentioned, I-5 and large parks do limit the walk shed to a station and accessing the station by transit becomes more important. The stations at NE 130th Street and NE 145th Street were assessed for future TOD and results are documented in the *Station Area Transit-Oriented Development Potential Report*, as referred to in the Final EIS, Chapter 4.2.

I-445-003
Multimodal connections to stations, including bus connections, will be refined in coordination with partner transit agencies and local jurisdictions in the Final Design phase of the project.

Subject: Comments

I-446-001 | Please include a station at NE 130th. Also, please don't make the Lynnwood extension just another
I-446-002 | commuter railroad with lots of park and rides. That's what Sounder is for. Link should be an urban rapid transit system with plenty of transit-oriented development around the stations. Station areas need housing, jobs, and shopping centers. They do NOT need massive park and rides.

Yours,

Justin Elder

1

I-446-001

Your support for a station at NE 130th Street is noted. Parking supply is being offered at the stations as part of a balanced multimodal access program that serves the mobility needs of the nearby communities and the region.

I-446-002

Sound Transit's TOD policy in part, states: “Assess the extent to which development of alignments, station locations, and transit support facilities affect and support implementation of Agency and Community TOD strategies.” Sound Transit prepared a *Station Area Transit-Oriented Development Potential Report* that provides details about each station area and how it might (or might not) support future development. Section 4.2 on Land Use includes information on the plans of corridor jurisdictions.

Subject: Save the Latvian Community Center - Lynwood Link DEIS

To the Sound Transit team-

I-447-001 I thank you for giving the Latvian community a chance to voice our concerns about the Lynwood light rail encroaching onto our property, making it impossible to access our community center.

I am urging you to come up with some other solutions that would deter you from harming our most special center, as this unbelievable place can never be replicated nor replaced.

I am a first generation Latvian, who grew up attending the Latvian church and Saturday school. There I made friendships that have lasted my entire lifetime, I have found a sense of community with so many people from all generations who fled Latvia to find a safe and free place to live and build their families. Now I am proud to say that my 4 yr.-old son is attending this very same school so that he may experience the same friendships and strong community that I did when I was younger. He just attended his first class this past Saturday, September 21st and said he had the greatest day, that it was even better than his regular pre-school. That says a lot, considering he loves his American pre-school. It brings me SUCH joy to be able to pass down the language and culture to my kids, and I cannot even express to you what a tragedy it would be for us to lose this place for our children's use. Without this gathering place for the Baltic communities we run the risk of losing members and losing touch with our Latvian roots.

I hope that you have the heart to come up with a solution that would allow us to keep our present location in tact. Our families have already lost so much, sacrificed so much and this is not just a building, this is the heart of our community. Please don't take that away from our children.

Thank you for your time and your help in this very important matter.

Sincerely,

andra freet (36, mother of two)

I-448-001 I think the best alignment for the Lynnwood link is with the stations at 130th and 155th. There are enough "transit stations" along the Lynnwood link, one at Northgate, Mountlake terrace park and ride, as well as the Lynnwood transit station. We need neighbor station where people can easily walk to the station and keep cars off the roads

Subject: Comments on Lynnwood link DEIS

To Whom it may concern,

I am a resident of the Ridgecrest neighborhood, in south Shoreline. I would like to comment on the DIES for the Lynnwood light rail extension; especially with regards to the proposed and currently undecided stations at 145th or 155th.

I-449-001
- I and many neighbors in my neighborhood would like to see little to no use of parking garages, around the planned stations. It seems puzzling to us that Seattle Stations do not have planned parking garages but Shoreline Stations all have planned parking garages. In general, If there must be a garage around the station I/we would like the garage to be as unobtrusive as possible, displacing the fewest number of residents as possible. That being said I would prefer a smaller station at a 155th street and move the site of the garage, to the north side of the street and to the east of I-5, where the small church is. By doing this you displace fewer residents and you hide the garage against the freeway. You also make the garage more accessible to driving north along 1st. It's then just a short walk under the covered freeway overpass to the proposed station.

I-449-002
- Accessibility to these stations is also a very large concern for residents in Shoreline. If people aren't able to easily reach the stations then no one is going to use them. One idea I've heard that to help make either station more accessible is a walking/bike path along the tracks of the trains against the freeway. The biggest way to increase accessibility for Shoreline residents are the chosen locations. I feel that a 155th Street Station is a better choice for our area. It is has far more residents currently living within walking distance of the station. The 145th Street station only has a few neighbors living to the north east and even fewer to the west. Also as zoning restrictions change the area around the 155th station will be able to add more new housing without displacing as many current residents since both the north and south sides of the street will be open to development. In the case of the 145th Street station only the north side of the street will be open to development. this also means that any development at the station location would have to be a large condominium or apartment structures which no one in the neighborhood wants to see. The 155th Street station will also be more bike friendly since that street already has bike lanes moving in both directions. 145th Street currently has none. Finally accessing the station by car will also be easier at the 155th St station. 145th Street itself is currently being used at peak capacity. During rush hour times traffic can be backed up all the way to 15th Ave, and we are still 10 years away from having a station put in. To that even more cars from people trying to access the station and that street will be a nightmare. The only way to make that 145th Street more useable will be to widen it. With Jackson park and Lakeside School to the south the only way to widen

I-449-003

I-449-004

I-449-005

1

I-449-001

Your preference for a station a NE 155th Street is noted. Station parking facility sizing and design proposals were developed to balance the need for good multi-modal connections and access to serve local communities and the region.

I-449-002

Park-and-ride spaces provide access to light rail for areas transitioning from suburban to urban densities and reduce spillover parking impacts to neighborhoods. Sound Transit's design seeks to find a balance between competing interests of providing auto access to stations, potential spillover parking, and encouraging pedestrian, bicycle, and transit access to light rail stations.

I-449-003

Thank you for noting your preference for a station at NE 155th Street, rather than at NE 145th Street.

I-449-004

Your comment on bike lanes on NE 155th Street is noted.

I-449-005

The Preferred Alternative includes a station at NE 145th Street. The Final EIS analyzes potential traffic impacts in Chapter 3. All alternatives would include improvements that address traffic impacts as detailed in Section 3.6.4.

I-449-005

that street would be to take properties away from Shoreline residents, probably in the amount of 20ft or more, which would displace hundreds of local residents. Traffic at 155th Street is not anywhere as bad as 145th and in fact the street could still handle more cars and not be over used. To top it off all of 155th street could be widened by 20ft, to better handle the increased traffic do to the station, without displacing any current residents (just possible easements). Because both sides of the street could be used to widen the road, only people's yards and a small strip of two parks would have to be taken.

I hope you will take our concerns seriously, I see light rail transportation as a great remedy to our current worsening traffic problems. However, if you do not make it easily accessible, no one will use it.

Thank you,

Jeremiah K. Fulford-Foster

Sent: Sunday, September 22, 2013 6:39 PM
To: Lynnwood Link DEIS
Subject: Shoreline station

I-450-001 1) The station in Shoreline needs to be connected to other transit options. There also needs to be adequate parking. More people will use transit if there is parking nearby (as can be seen in current light rail stations by the low ridership where there are no parking spots nearby). Most residents who want to commute by train year round are going to have to park their cars, not bike, not walk. Not many people out there taking a stroll during the November-March weather.

I-450-002 2) 185th street is a small residential area and there are not any public transit options on that route. There are also a high number of young drivers/pedestrians using that access to the stadium for games, matches etc. Keeping those kids safe around the train station could be problematic-locate the tracks as far from the stadium as possible-kids between 13-18 are not known for their common sense.

I-450-003 3) 145th street seems to be the most viable option for the train station. It doesn't give as good of access to the upper areas of Shoreline, but it has better transit options, parking options, existing areas.

I-450-004 4) The light rail project could very easily be put in the middle of the I-5 corridor. It's flat, it's clear, and people are already able to access it easily. Other cities have done it with far more efficiency.

I-450-005 I have one final comment. This project is very bogged down in the political process and it frustrates me that the light rail won't be here until 2023. The Panama Canal did not take that long to build!

Inspiring women with hope that they can live their best life ever

I-450-001

Multimodal connections to stations will be refined in coordination with partner transit agencies and local jurisdictions in the Final Design phase of the project. Sound Transit's design seeks to find a balance between competing interests of providing auto access to stations, potential spillover parking, and encouraging pedestrian, bicycle, and transit access to light rail stations.

I-450-002

Your concern for the safety of children in and around the NE 185th Street Station is noted. All light rail alternatives are entirely grade-separated in a secure, protected guideway. Further discussion of public safety is discussed in Section 2.3 for station areas and in Section 3.2.8 for analysis of transportation issues related to public safety. NE 185th Street currently has bus transit service. This transit service would integrate with the light rail station.

I-450-003

Comment noted. A station at 145th is included in the options considered in the Final EIS.

I-450-004

The proposed construction of rail in the middle of the I-5 corridor was not advanced for further consideration in Segment A. There is insufficient room to construct light rail in the median until Mountlake Terrace, and widening the roadway and moving lanes out would have similar property impacts and greater environmental impacts, particularly during construction. Additional details are provided in Final EIS Sections 2.5.1 and 2.5.2.

I-450-005

Comment noted; the project schedule reflects the time required to help

the project successfully meet requirements for federal funding approvals as well as local approvals needed for construction.

Sent: Monday, September 23, 2013 5:56 PM
To: Lynnwood Link DEIS
Subject: Comments

Thank you for taking comments on the Lynnwood Link project.

I-451-001

1. I would like to express my preference for the Segment A5 or A7 alignments that include stations at 130th St. 155th St. and 185th St. This arrangement has geometry on its side. It has the best spacing between stations and the best placement of stations in the street grid for future development oriented to maximizing our transit investment. This arrangement keeps the stations away from routes that are auto dominated and makes them more central to neighborhoods. A station at 130th is critical to avoid drawing thousands of people and cars south across Northgate way everyday. If these people can board at 130th, more of them will ride and overall tranffic and transit operations will be much better in the area. 155th St. will not work as well as 145th St. for cars coming from farther than 1 mile away. That is exactly why it should be chosen. You don't want to draw cars and then spend millions to mitigate the impact. You should draw the people who live close by and 155th has the best ped / bike connections. For 185th please keep everything on one side of the highway and provide adequate space for bus turnarounds.

I-451-002

2. In the B segment the station at Mountlake Terrace Transit Center should be placed East of the current garage, not in the freeway station. The walk to the freeway station is too long and will depress ridership and nearby development potential. The location of the proposed 220th St. Station should be altered slightly to go under the highway bridge on the west side of I-5. More riders would be drawn to the station if it were submerged rather than elevated at this point. The 220th St. Station would provide a good linkage with areas ripe for additional development and already hosting the densest concentration of jobs in South Snohomish County. Becaue many employees travel to these jobs from the North, the station may draw significantly more ridership than projected in the current study when further extensions are completed on the Link system. For that reason, even if the ST board chooses not to fund a station there at this time, it would be wise to reserve a place in the alignment for a future station to be voted on and built with ST3. This station would be the closest for many Edmonds residents and much easier for them to reach due to congestion expected to grow around Lynnwood. It has the potential to play an outsized role in shifting mode share of residents and employees in the area because of proximity to the Interurban Trail and Swift Bus Rapid Transit on Hwy. 99. Building a station at 220th St. could also relieve some pressure from intersections along 44th Ave. where residents living to the east would turn to reach light rail if it was only accessible at Lynnwood Transit Center or Mountlake Terrace Transit Center.

I-451-003

3. In the C segment, C3 is the clear winner. The impacts associated with the other two alternatives are not acceptable and would turn many light rail supporters in Lynnwood into vocal opponents of further expansion. C3 is actually closer to the core of Lynnwood's planned downtown development than the other options and would be the best site for walkability, despite

I-451-001

Your preferences for either Alternative A5 or Alternative A7 and the reasons why you support these alternatives are noted.

I-451-002

Your preferences for stations at Mountlake Terrace Transit Center and 220th Street SW, and the reasons why you support these alternatives are noted.

I-451-003

Your preference for Alternative C3 and the reasons why you support this alternative are noted. The Preferred Alternative evaluated in the Final EIS includes a modified Alternative C3, which realigns the guideway and station to better connect with the Lynnwood Transit Center.

I-451-003 proximity to the interstate. It could be designed to have direct access to the existing ped bridge that is part of the Interurban Trail and would thus avoid sending a flood of pedestrians across 200th St at 44th, 46th and 48th Aves. These are already horrific intersections for everyone, especially transit buses. If C3 is selected, the bus transit center should be moved to be proximate to the LRT station. Moving the bus bays to the SE quadrant of the site will allow better access from the highway HOV ramps with less conflicts. There should also be transit access provided at 202nd St. from 44th Ave. This would speed up trips and reduce congestion on 200th St. Also, as a mitigation, please explore extending the HOV lanes of 46th Ave. north from 200th St to 196th St. This improvement would likely reduce traffic loads significantly at 44th & I-5, 44th & 200th, 44th & 196th, 48th & 200th and 50th & 200th. In conjunction with the Lynnwood Link extension more work need to be done to provide for bus access to Lynnwood Transit Center. It is currently impossible to enter LTC from the HOV direct access ramps when coming from or going to I-405 or SR525. There is also a missed opportunity to have freeway stops on SR525 at 164th and on I-5 at 128th St. The Swamp Creek Park and Ride and Mariner Park and Ride are currently underutilized due to the lack of direct stops and ST service. The lack of stops confounds routing and forces duplicate service to be provided from Everett to the south, wasting precious transit operating funds.

I-451-004 4. Either I missed it or, The DEIS fails to account for a low parking scenario where auto parking is effectively managed and priced so that some spaces are always available, but demand is balanced by assessing to users the cost of parking provision and congestion while bicycle parking is expanded, with maintenance and sharing service also accomodated on site. Considering the cost of parking improvements and traffic mitigation proposed as part of the project, such an omission is not acceptable.

I-451-005 5. Finally, There is little discussion of the power used for train propulsion. Electric power drawn by LRT trains should not cause the region to increase generation or purchase of power from sources that are not clean and renewable. LRT should include regenerative braking and battery systems and should incorporate solar, micro-hydro or wind power generating equipment in the stations, guideway and right-of-way whenever possible.

Thank you for your time in reviewing my comments and for all the hard work that has gone into this project. I support it 100% and look forward to using Link more regularly.

Eric Goodman, AICP
8010 181ST PL SW
EDMONDS, WA 98026

I-451-004

The EIS considers the highest traffic impact with no parking restrictions at the stations. The station parking facility sizing and design proposals were developed to create balanced multi-modal access programs that serve the needs of the region as well as local communities. Parking management strategies, including pricing, may be considered in future phases of the project, based on Sound Transit Board directions for applying its system access policy.

I-451-005

The light rail alternatives are expected to primarily shift commuters from automobiles and light trucks to light rail as well as bus traffic to light rail. It is projected that with light rail, energy consumption would decrease by about a half of 1 percent as a result of mode shift as well as higher operating speeds on roadways, which would improve fuel economies for all vehicle classifications. During final design, Sound Transit would investigate methods of reducing energy use during light rail operations and construction as part of its *Sustainability Plan* and agency-wide sustainability efforts. Please see Section 4.10 of the Draft EIS for more information.

Subject: Please Save the Latvian Church and Community Center

Hello,
My wife and I are members of the Lithuanian community and I am writing to you to regarding the Latvian Church and Community Center. The Latvian Community generously allows our community to utilize its facilities.

Connecting with the Baltic people at the Latvian Church and community center has greatly enriched our lives here in Seattle. I have attended St Martins festivals, Independence Day Celebrations, religious worship service, funerals, and Memorial Services for the Anniversary of the Deportation of Baltic People to Siberia (some of which my wife's family endured. I participate regularly in these events at this center, and it has connected me to a community that I hold dear.

I-452-001 Losing this great facility would impact our lives and be a great loss to Seattle. This community center is just the kind of thing that makes Seattle a multi-cultural and unique place in which to live.

I understand that construction will go forth with the rail line, but please include the following requests during construction in order to keep our Church and Center available to the community.

- Please keep access to the Latvian center open during construction, at-grade rather than the elevated options

I-452-002
- Please mitigate construction and post construction impacts such as dust, noise and vibration.

I-452-003
- Please do NOT relocate the Latvian Center. Please help us find ways to keep adequate parking and access.
- If it mandatory that that Latvian Center be relocated, please ensure that a fair price is paid and that we are able to relocate to a nearby location of the same size and accessibility

Thank you very much in advance for including these requests in your construction plan.

Sincerely ,
Bill Graffis

1

I-452-001
Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. Access to the church would be maintained during construction.

I-452-002
Sound Transit would mitigate dust during construction. Please refer to Section 4.6 in the Draft EIS for more details on air quality and specific mitigation commitments.

Sound Transit would mitigate noise and vibration during construction and would provide noise and vibration mitigation where feasible and reasonable. Please refer to Section 4.7 in the Draft EIS for more details on noise and specific mitigation commitments.

I-452-003
Thank you for your comments. Please see Sound Transit's full response to comment I-452-001.

Subject: Latvian Lutheran Church, Northgate

Dear Board,

I-453-001 I'm writing you with extreme concern about the fate of the Latvian Lutheran Church and Community Center in the Northgate area. This is a facility I helped build when I was 12 years old. My main job at that time was to help pick up trash. After its completion I attended Latvian school there in the early 70's. I also went to listen to choir concerts and watch plays. During the Cold War period, I remember going and listening to Senator "Scoop" Jackson speak about the U.S. position on Latvia with respect to the Soviet Union. For years I participated with the Latvian folk dance group as we rehearsed for various song festivals around the US and numerous trips to Latvia to perform. I have been a official member of the Latvian Lutheran Church, since my confirmation there in 1977. I was married in the Church in 1998.

Currently, I attend various functions at the church or community center numerous times per month. I purchased my house in the Shoreline area to be close to this cultural/religious center. We frequently hold events at the center that includes Latvians from up and down the West Coast. We have concerts or plays from groups from Europe, Australia and Latvia.

I would strongly urge the board to follow the suggestions/whishes of the Latvian Assoc./Church board that you have been meeting with.

As a side note, in the back of the Church is a play area for the kids that attend the Saturday Latvian school. This area is dedicated to my cousin, who died tragically, way too young. He was a student and teacher at the school. I would hate to loose access to this area.

Thanks and regards,

Valdis Grauds and family
14813 Interlake Ave N
Shoreline, WA 98133

Subject: Save the Seattle Latvian Hall

Good afternoon,

I-454-001 I am a member of the Seattle Lithuaninan and Seattle Latvian communitites having a Lithuanian mother and Latvian father. I have attended events at the Latvian hall since I was a baby over 30 years ago and now have a child of my own that I hope will attend events at the hall.

Besides the many cultural events that include Independence Day celebrations, folk dancing practice, Latvian school, Christmas and other holiday get togethers; I've been to baptisms, memorial services, concerts, and weddings including my sister's wedding in 2009. When I graduated college my friends and I held a large party at the hall.

This year I was the director of Lankas, the Lithuanian American children's camp. We depend on events held at the Latvian Hall for our fundraising events and to build up our community.
Our communities have been struggling financially for years and we depend on the Latvian Hall as a place dear to our hearts but also as an affordable venue.
The hall is important to our communities for many reasons and while I understand the transit will come I sincerely hope you take our letters into serious consideration and work with us to find a solution that satifies all sides.
If we must move, we need a venue that meets many needs-a church, a large hall or auditorium with a stage that can accomodate 200 people, classrooms, handicap accessable restrooms, a kitchen, pleasent grounds outsides with a reasonable amount of parking and a place that is easy to find.
I know that older members of our communities live close to the hall and very much hope their needs will be considered as well.

The hall is used frequently and we hope that the hall can stay open during construction as we do not have other available venues.

Maintaining our cultural identity and passing on the traditions to our children is crucial and the Seattle Latvian Hall is thet primary venue for the Lithuanians, Latvians, and Estonians to do so.
Thank you,
Julija

Subject: Re: submitting comment

Hello,

I would like to submit the following additional comments:

I-456-001 1. Infrastructure for bicycle parking at Northgate station and all additional stations would be beneficial.

I-456-002 2. As a resident in the Haller Lake neighborhood, I support at-grade choices in the segment from Northgate to 130th with careful mitigation of noise pollution through use of sound walls. At-grade choice is preferred to minimize the negative visual impacts and to preserve the residential landscape.

I-456-003 3. I support a station at 130th in segment A.

4. Please consider putting in less infrastructure for cars and more infrastructure for bikes (including bike parking and safe bike lanes to reach stations).

Thank you for considering our needs and preferences. Please do not hesitate to contact me if you have any questions.

Sincerely,

Joanne Ho

To: Lynnwood Link DEIS
Subject: Sound Transit Lynnwood Link Alternatives

Sound Transit Board Members,

My name is Jeffrey Janssen, and I have been a resident of Lynnwood for 23 years, living in the same home, raising five children. My address is 20314 56th Ave W. I live four blocks from the cross streets of 204th St SW and 52nd Ave W. After attending the most recent Sound Transit/Lynnwood Community meeting on September 14th, I was approached by seven of my neighbors and asked to write a letter to the board and express our concerns, referencing the options C-1 through C-4, Lynnwood Link Extension. I respect the endeavor, the process and obligation Sound Transit is charged with.

I-457-001

Regarding the alternatives Sound Transit presented to citizens of Lynnwood, at a meeting on September 14th, 2013, for consideration in extending Link Light Rail into our community; we believe the options labeled C-1 and C-2, to be inferior and destructive to our neighborhood and the city of Lynnwood, as a whole. Option C-3 and the additional option C-4, are vastly superior in scope and far less intrusive to the people who will be impacted the greatest.

Options C-1 and C-2, continue the erosion of our neighborhood and the very structure of the city itself. In years past, Lynnwood has been bisected by the construction of Interstate 5, which directly results in significant and constant traffic headaches moving people and services from East to West and vice-versa. The neighborhood in question, from 200th St SW to 212th St SW, and from 52nd Ave W to the Interstate has also been greatly impacted by the Lynnwood Park N Ride. In short, we cannot move along the streets without a constant stream of stagnant traffic. The end result is a much lower standard of living for the surrounding residents as well as the business owners trying to make ends meet, midst an already poor and elderly population. Options C-1 and C-2, will continue to destroy this fragile community, remove businesses from their property and customer base, as well as uproot a large number of families. The very idea that a resident of this neighborhood must remain in their home and be offered a 'view' of an elevated track and train from their living room window is repugnant.

C-1 and C-2, will obviously destroy a substantial area of existing wetlands and a small but environmentally important park. Why this is an option is beyond reason. The damage to 52nd Ave and 200th St SW will never be reversed and can't be mitigated. Certainly, along 200th St SW, from 52nd to the East entrance of the Lynnwood Park N Ride, this tree lined avenue is attractive and although heavily traveled, very inviting. C-1 and C-2, will be a permanent eyesore with far-reaching consequences to the citizens of an already low-income community.

Please consider option C-3 and the possible option, C-4. Both offer a lower dollar cost as well as a much lower cost to the immediate environment and neighborhood. The proposed Lynnwood Sound Transit Station, needs to be a 'get on, get off' affair. Any illusions that this particular station will become anything more than a hub, is at the very least, unrealistic. 'Destinations' should be reserved for future light-rail extensions, serving and supporting the Lynnwood Convention Center and Alderwood Mall. The Sound Transit Board should consider these options with concern for the citizens they serve.

Thank you;

Jeff Janssen
425-773-6682

Subject: Lynwood Extension/Latvian Church

I-459-001 I think this would be a real disservice and hardship to the Baltic community. The Estonians and Lithuanians also use this facility, and it is thus a public facility for the 3 Baltic American groups. I have been going there for 40 years -- to church, to public holiday and commemorative celebrations, and for private celebrations like weddings and funeral memorials. Lack of access, plus the noise and vibrations, would mean the end for these uses, and result in the end of these vibrant communities since they have nowhere else to go that is large enough. Would you do this to any other cultural group? I doubt it.

Linda R. Kask

Subject: Latvian Center

I-460-001

As part of the Lithuanian-American Community organization, I am dismayed that the center of our cultural activity is in jeopardy. The numerous members of the Baltic community and their friends from other ethnic and American groups in Seattle and from the whole world attend meetings, concerts, commemorations and various other activities at the Center which is geographically ideally located for our events. As an affiliated professor at the University of Washington, I go to the Center several times a month, as does my daughter's family, living in North Beach with her husband and two young children--in fact, they go even more often than I. They participate in folk dancing, singing, Christmas party with Santa, egg-dying at Easter, Saturday school and other activities too numerous to mention. I go to other events, many of them educational or cultural. The Center is a focal point of many of our civic and cultural meetings and lectures and it would be an incredible loss for our extended communites, if the building and parking lot were to become unuseable for us. Currently the Center has a very comfortable layout, and great facilities with church, various halls, kitchen, and room for all our and other organizations' needs.
This is the result of the efforts of many people over many years and cannot be allowed to go to waste.

Although we are aware that the rail line extension is a valuable project and will be of benefit to many, I hope that a way can be found to minimize the impact on the Latvian Center at all times, during construction and in the future. I would like to state my preference for the at-grade option as leaving us a workable parking lot. Of course, I am very concerned that the Center and its surroundings remain open and useable during construction. I am sure that a workable solution can be found and appreciate any and all efforts to accomodate our needs. The Center is one of the bonuses and delights of living in Seattle for many.
I thank you for your attention and wish you all the best in your difficult but judicious deliberations,

Violeta Kelertas PhD

Subject: DEIS Comments

From: Pat Kenney
14824 Densmore Ave N
Shoreline, WA 98133
Patkenney00@hotmail.com
Please sign me up for project email updates.

Thank you for this opportunity to respond to the Draft EIS for the Lynnwood Link Extension. I believe the increased transit options will add a great deal to Parkwood neighborhood and all of Shoreline. My major concern is for safety and the environment.

I-461-001 Safety includes not only at the stations but in the near vicinity and access routes to the station. This includes good lighting that lights the intended space and does not cause excess light to residents, neighborhoods, or parks. Sidewalks are necessary for the access to the station to allow for wheelchairs, strollers, and luggage. Intersections must have good crosswalks, be well lit, and have pedestrians separate from vehicles and have accommodation for slow walkers, and have good signage prior to the approaches The traffic lights need to be timed to reduce the frustrations that cause pedestrians to race through traffic across streets and drivers to pull into a clogged intersection.

I-461-002 Land Use; I realize some homes will be purchased or property reduced and that the owners will be appropriately compensated and assisted to find alternatives. This is for the good of many more. I am concerned that lands that are habitat for migratory birds be replaced in as close proximity as possible with similar fauna. There is concern that sandy soil (around Ridgecrest Park) if disrupted could put homes above in danger, and that bog land (Ronald Bog and vicinity) could also impact homes.

I-461-003 Economy: A station at NE 155th would be closer to local business in Shoreline, and closer to the Aurora Square Retail/Condo complex envisioned for 155th near Aurora.

I-461-004 Neighborhoods: There will be spillover traffic on neighboring streets which must be mitigated for with circles or other speed control measures.

I-461-005 Visual and Aesthetic Resources: Trees and vegetation removed should have new greenery which will mitigate both the noise and the lack of view.

I-461-006 Air Quality & Greenhouse Gas Emissions: There should be adequate turn around for buses and for safe drop off of riders in order to reduce idling time and emissions.

I-461-007 Noise and Vibration: Sound barriers can be living rather than cement which vibrates sound back and forth.

1

I-461-001
Sound Transit will work with jurisdictions and local communities to determine the most appropriate treatments to provide for safe and effective pedestrian access to and from the station for pedestrians. Sound Transit will build ADA-compliant pedestrian facilities fronting the station areas and roadways that are reconstructed as part of the project. It would be a local responsibility to complete sidewalk links away from the station. Section 4.14 of the Final EIS discusses safety.

I-461-002
Sound Transit's *Sustainability Plan* promotes the establishment of native vegetation. The revegetation plan for this project will emphasize the use of native plants.

During preliminary design, Sound Transit conducted geotechnical borings and detailed soil analysis to inform and refine potential design and construction approaches to avoid potential impacts. At Ronald Bog Park, the preferred alignment will be located on the east side of the freeway. Because of the distance of the project from the park, the construction and operation of light rail are unlikely to affect the soils below the park. See Section 4.11 of the Final EIS for the discussion of geology impacts.

I-461-003
Your comment is noted.

I-461-004
Sound Transit will mitigate for traffic impacts caused by the project at intersections that will operate at levels of service below standards.

I-461-005

I-461-008 Ecosystem Resources: Permeable pavements for sidewalks and driveways would minimize runoff. The additional traffic to and from the station will produce more toxins getting into the ground water. The effect should be mitigated from getting into the waterways nearby (streams, creeks, ponds, and
I-461-009 bogs). Solar technology should be used for lighting and signaling as much as possible.

I-461-010 Station Amenities: There should be drinking water and restrooms at the stations. There should be adequate handicap parking, as well as space for scooters and other mechanical means of transportation which help riders get to the stations without using cars. These should be close to the station, especially where the parking garage is at a distance.

2

See Section 4.5.6 in the Final EIS for discussion of the potential visual impact mitigation measures.

I-461-006

Stations are designed to provide adequate access and turn around for buses and for safe drop off of riders. See Appendix F for the project's conceptual plans.

I-461-007

Your comment is noted.

Vegetation offers limited noise abatement value. At least 100 feet of dense foliage that contains leaves year round is needed to provide up to 3-dBA reduction. However, a 3-dBA reduction in noise is barely perceptible to most people. Noise walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts.

I-461-008

Managing stormwater is a priority for Sound Transit. The project would be designed to comply with all federal, state, and local regulations, controlling potential risks to water resources through project planning, design, and the application of required best management practices. In addition, Sound Transit requires all projects to consider low-impact development (LID) methods, such as permeable pavement, as a first choice for stormwater treatment (Design Criteria Manual, July 2012).

I-461-009

During final design, Sound Transit will investigate methods of reducing energy use during light rail operations and construction as part of its *Sustainability Plan* and agency-wide sustainability efforts.

I-461-010

Sound Transit station designs do not include public restrooms, partly for health and safety/security reasons, and drinking fountains are not standard features of the current system's light rail stations. The stations will include pedestrian and bicycle facilities to support and encourage the use of nonmotorized transportation to the stations.

To: Lynnwood Link DEIS
Subject: Lynnwood Link

To Whom it May Concern,
I am a resident of South Lynnwood one block west of the proposed Lynnwood Link route for C1 and C2. I am opposed to these proposed routes for the following reasons;

I-463-001

C1: - C1 is the most invasive and disruptive route of the three. It would take out far too many homes, displace many Lynnwood residents, completely change the dynamic of quiet neighborhoods, and potentially ruin an F4 designated wetlands. This is seriously a bad plan.

C2- - C2 is even more harmful the valued wetlands and park. This plan would destroy the wetlands and wildlife. It would never return to it's current pristine condition. It would also bring the train through quiet neighborhoods needlessly and take out a large engineering complex.

C3- Is definitely the least damaging route for the local residents and the wildlife of the wetlands not to mention keeping the spirit of Lynnwood conservation alive. You see we are more than just a mall and a freeway exit. We are a thriving harmonious group of diverse neighborhoods, small businesses, ethnic restaurants and civic minded people. We like our city.

I urge you to select option C3 as the route for the Lynnwood Link.
Thank you.

Karen Kinman
5308 202nd Pl SW
Lynnwood, WA 98036

1

I-463-001

Your preference for Alternative C3 is noted. The Preferred Alternative in the EIS is a modified Alternative C3.

Subject: Comment on DEIS for the Lynnwood Link Extension proposal

Sir or Madam:

Major inadequacies in the nominal DEIS for the Lynnwood Link Extension proposal are patent in several essential areas, including at least those five critical-to-fatal defects identified hereinafter.

I-464-001 Highly adverse impacts on the state highway system by the proposal at issue are inadequately addressed to fulfill central requirements of the Washington Administrative Code, including explicit legal responsibilities to examine negative impacts thereon, so as thereby to yield a legally deficient nominal DEIS due to failures to meet minimal adequacy requirements for any acceptable DEIS, pursuant to WAC 197-11-440, *via* analyses of "reasonable alternatives" and of "costs of and effects on public services," inclusive of "roads" specifically.

The nominal DEIS also fails to analyze pivotal legal limitations imposed upon the proposal, both pursuant to the WAC provision cited *supra* and also otherwise, due to inadequate evaluations of: (2) insufficient funding resources available to the proponent to pay full and fair market value for extensive state highway rights-of-way required for the proposed project as is indisputably required legally by the 18th Amendment under the Washington State Constitution following our state Supreme Court's decision on September 12, 2013 in *Freeman v. State*, ___ Wn.2d ___ (2013); (3) planned reliance upon financial resources from an anticipated federal full funding grant agreement in a fashion squarely contrary to legally mandatory application of Sound Transit's "subarea equity" obligations to allocate federal grant funds across all five subareas so as to benefit East Link equitably; (4) further planned reliance upon debt financing far beyond said agency's $800 million maximum limit upon total long-term debt for the project at issue pursuant to statutory contract obligations that it squarely undertook, legally, to obtain any taxing authority from King, Pierce and Snohomish counties, including Pierce County's incorporation of said legal limitations into its authorizing ordinance; and (5) clear lack of adequate parking within the City of Seattle for the Lynnwood Link Extension to operate as a part of a reasonably functional light rail system.

Respectfully yours,

Will Knedlik

1

I-464-001

Your comments are noted. Sound Transit and FTA have prepared a legally sufficient Draft EIS and Final EIS pursuant to NEPA and SEPA. Both documents contain reasonable alternatives (see Chapter 2) and discussion of the potential impacts of the project on environmental resources (Chapter 4), and the highway system (Chapter 3).

The Lynnwood Link Extension is part of the Sound Transit 2 system expansion that voters approved in 2008. Sound Transit's financial plan assumed some federal funding as well as voter approved sales, motor vehicle excise and rental car taxes, state and federal grants, passenger fares, and bond proceeds.

Subject: save the Latvian Center!

I-465-001

I am writing with a concern about the construction plans for the Lynnwood link extension. I strongly urge you to keep the Latvian Center (11710 3rd Ave N.E., SEATTLE, WA 98125) open during construction, specifically the at-grade option, not the elevated option. Please do everything you can to keep the Center open after construction as well.

I am a member of the Lithuanian-American community. We use the Latvian Center regularly throughout the year for miscellaneous cultural events. My family specifically uses the Center for weekly folk dance lessons and for summer camp planning meetings. We go to holiday parties which foster connectivity in our community. We attend our annual Independence Day event, with guests from the region, as well as other cities and states, and even from Lithuania. I am also a member of the charity group Daughters of Lithuania, which hosts many events there, including fundraisers and memorial services. The Latvian Center is just the- central to our lives. Please consider the impact of any changes you make during and after construction!

Thank you for your time,

Rima Kulikauskas
7345 18th Ave NE
Seattle, WA 98115

I-465-001

Thank you for describing the importance of the Latvian Center to you and the Lithuanian-American community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained during construction and operation of the project.

Subject: Effect of Lynnwood Link on the Seattle Latvian Cultural Center and Church

Dear Members of the Board,

I-466-001 I am writing to you with the hope that you will consider choosing the route option that is the LEAST disruptive to the existence and operation of the Latvian Cultural Center and Church just north of Northgate.

I am a first generation Latvian-American and have lived in the Seattle area since 1992 when I moved here from the East Coast. The Latvian Center has been my home away from home and has allowed me to continue participating in the cultural activities that I enjoyed growing up in New York and Connecticut. In addition to attending church services, I am a member of the choral group "Sigulda" and we use the Center for weekly practices and regular performances. I am a member of the student fraternity "Beveronia" and we use the center for our meetings. My young son just started Latvian School this month and will spend several hours every Saturday learning about Latvian traditions, folk songs, and language (which his mother and I speak at home). In addition to these main uses of the Latvian Center, we also attend dance performances, lectures, concerts, films, weddings, and dinners.

The Seattle Latvian Center is the hub of a great number of events that help preserve the culture of our parents and grandparents. Any disruption to its operation (even temporarily) would negatively affect the important work that is done there.

I hope that the board will choose a route that will minimize impact on the Latvian Cultural Center. Thank you for your time.

Sincerely,

Dr. Paul Kulits
Everett, WA

Subject: ATTENTION: In Support of The Seattle Latvian Evangelical Lutheran Church/Center

Hi, there!

I recently heard about the possible extension of the light rail through The Seattle Latvian Evangelical Lutheran Church/Center from a good friend of mine who is of Latvian heritage and has been part of the Latvian community her entire life. I know my e-mail is last-minute, but I really wanted to lend my support to the Center. :)

I-468-001 I don't live in Seattle, so the Church/Center doesn't affect me directly. But I do know how important Latvian culture is to my friend, and that she not only spends a lot of time at the center itself but also works to bring cultural experiences such as those shared there to communities outside the Seattle area. I believe it's important to do our best to preserve our multi-cultural opportunities, and I'm sure the Center means just as much to a lot of other people in the area, too. So I hope that a compromise can be made so that they can continue to access the Church/Center alongside the new light rail plan.

Thank you for listening! I appreciate your time.

Subject: Symbols of Latvian Freedom

To Whom It May Concern:

I-469-001 I am writing to you because I have just learned the unfortunate news that the Latvian church and community center in North Gate is in danger of being torn down or a similar fate in order to make way for a light rail system.

While I recognize that local governments must do an extraordinary balancing act when planning such necessities as mass transit, it is my hope that I can appeal to your sense of appreciation for what exactly this place means and what it stands for.

I could discuss at length about what amazing services that the place currently offers, or how much it meant to our grandparents, refugees from the war, to build such a center. But I'm sure that others haven't already written at length about this. Instead, I'm going to tell you about what this place symbolizes.

Living on the East coast, in cities such as Washington, DC, Boston, New York and Philadelphia, one actually gets to immerse oneself in our Nation's history, including the revolutionary war. A lot of that history is enshrined in many of the historic buildings and structures that dot the cityscape as well as the countryside. Many of these buildings, such as the Carpenters' Hall in Philadelphia, are not historic only because they're old. They're historic also because they played such a pivotal role in shaping our history. In the case of Carpenters' Hall, it is the site of the meeting of the First Continental Congress. No history lesson needs to be given as to how important the Continental Congress was.

Much the same way that the Carpenters' Hall continues to stand to this day because it was so instrumental in helping to enshrine the fundamental groundwork of this Nation, including our many liberties and rights that we cherish so dearly, our Latvian center continues to stand in large part because it served as a stalwart in Latvia's existential fight against Soviet aggression. As long as that building has stood, Latvians and their allies have had a place to convene.
Not just for the sake of fraternity and community, but also for the sake of planning and action. The Latvian struggle for independence was long, and it was hard, but the sweet nectar of freedom and liberty from the Soviet yoke meant that it was worth it.

It is a little known fact that many Latvian organizations, such as the American Latvian Youth Association (http://alja.org/en/about/) received seed money for their founding from the CIA. These organizations were on the front lines in organizing the people into action and bringing awareness to the Baltic plight. These organizations were of such vital importance to not only Latvia's continued existence, but also to U.S. national security and foreign policy interests that the American intelligence apparatus helped to prop them up. And these same organizations have hosted countless meetings, conferences, conventions and congresses; many of them at this very Latvian center under question.

Today, Latvia stands free, but the shadow of Russian power is long, and it is dark. Latvian centers such as this one serve as a daily reminder of what it took to stand free. They also offer a place to go in case Latvian freedom is ever threatened again. And this last part is important, because many Russian polls consistently list Latvia as a top

I-469-001

Thank you for your comments about the need for the Latvian Center. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-469-001 enemy of the Russian state. Because of this, Latvia and Latvians must always remain vigilant, and we will always need the Latvian center.

Carpenter's Hall in Philadelphia, because of its roll in our history, will essentially never be in danger of a mass transit system ruining its historical integrity. Considering this Latvian church and community center's historical context, it should not be too much to ask to extend it a similar respect.

Warmest regards,

Imants Mohseni
Germantown, MD

Subject: Lynnwood link for Sound Transit input

Sound Transit,

I have attended the recent Lynnwood meeting for information on the proposed Transit link up in Lynnwood and would like to put forth my input.

I-470-001 C#1 and C#2 cause most disruption and ecological damage. C#3 avoids much disruption but is in conflict with the existing transit offramp and the Lynnwood Treatment plant that needs to be enlarged.

The proposed amended C#3A (C#4) is the best of all proposals; it avoids most disruption, Environmental damage and places the off load in a favorable location. It will also be in the best location for further rout direction in the future... I commend the Lynnwood Engineering Department for thier C#3A (C#4) proposal.

Sincerely,
-Roger Oborn

Lynnwood area resident

I-470-001

Your preference for Alternative "C#3A" is noted. "C#3A" is a modified version of Alternative C3 that was developed by the City of Lynnwood.

The Preferred Alternative for this project, as described and evaluated in the Final EIS, includes Alternative C3, modified from what was shown in the Draft EIS so that it better connects with the Lynnwood Transit Center, preserves more re-developable area, and further minimizes wetland and stream impacts to the extent feasible.

Subject: Sound Transit station @ NE 185th St

Dear Transit Planners...

I am writing in regards to the proposed station at NE 185th St in Shoreline.

I-471-001 I am very pleased at the prospect of a station quite convenient to my home. Looking at the possible station orientations and facilities I note particularly the proposed parking solutions.

The most useful placement for parking for people using the light rail is on the East side of the freeway, as close as possible to the station itself. The most useful configuration is a structure rather than a strictly ground-level lot.

If the parking lot is too far, for example on the West side of the freeway, or the secondary lot proposed for the 10th Ave NE open space, people will not want to walk Anyone with a mobility challenge or material to carry would find the trip daunting.

In order to serve the purpose of increasing the use of mass transit instead of single-occupant cars, the system must be convenient and easy to use. If people have to walk far, or drive around looking for a place to park, they will choose to drive instead.

Thank you for considering this opinion.

Sincerely,

Ieva Ohaks

17810 3rd Ave NE

Shoreline, WA, 98155

206-362-9252

ieva@pandorahouse.org

I-471-001

You comments are noted. The station a NE 185th Street will have bus transit, pedestrian, and bicycle facilities to support and encourage other modes of transportation than cars.

Subject: ATT: Lauren Swift RE: Latvian Center

Dear Sound Transit officials:

I-472-001 I am writing from Washington, DC in support of the movement to resolve the issue regarding the possible displacement of the Latvian Church and Center because of the northward expansion of the Sound Transit line.

My wife's family has been actively involved in the Latvian community through theater, folk dance, choir and Latvian school since they arrived in Seattle in the early 1950's. My late father-in-law was president of the Latvian Organizations of Washington State for more than 10 years.

We were married at the church and celebrated our wedding at the center. In our 35th year of marriage we still maintain close ties to the Latvian community in Seattle and many of my wife's childhood friends remain our closest friends. Our children have become friends as well. The common thread in these relationships is the cultural, academic and spiritual experiences and bonds that the Center and its community have provided. We have a similar Latvian Church and Center here in Washington DC which bonds our community together as well.

Endangering the Center is not the same as, for example, a church being demolished and the parishioners simply asked to move to another church. There is no other Latvian Church or Center in the Seattle area that holds all of its functions in the Latvian language and maintains the traditions of our Latvian heritage. It is hard to imagine all that would be involved to develop a new location.

The Center is the heart of the community and losing it would indeed be the loss of our community as we know it. I hope that our letters will address both the hearts and minds of the Sound Transit Board and move them to seek an alternate solution perhaps something as simple as having the line traverse I-5 at some point before the location of the Latvian Center.

Kind regards,

Aivars Osvalds
Scarlett Berkolds Osvalds
Laura Osvalds Kalnins
Grant Osvalds

Washington, DC.

To whom it may concern.

I am very concerned about the impact of the light rail on my Latvian Cultural Center at 11710 Third Ave. N.E. Seattle, WA 98115

I-473-001 For almost 30 years, the Latvian Center has been an integral part of my life. Growing up, I went there every Saturday to learn Latvian culture and language. My father was forced to leave his country when he was just a young boy. The Latvian Center allowed him to stay connected with his roots and people, and also allowed my sister and I to learn the language and culture. Words cannot express what this meant to our family. I have so many memories from the center. I love it so much, that I decided to get married there this last summer. I would be deeply saddened if this was taken away from our family and community. It would be so sad to think that people who were forced to leave their country, would now years later be forced to loose their cultural center as well.

Jana Pelekis

I-473-001

Thank you for describing the cultural importance of the Latvian Evangelical Lutheran Church to you. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. Subject: Lynwood Link Effects on the Latvian center

Good afternoon

I-474-001 As an active member of the Lithuanian-American Community in Seattle since moving here in 1978, I have regarded the Latvian Center as a home-away-from-home. Without immediate family here, the Center has provided a means of gathering with our extended family of local Lithuanians and fellow Balts, the Latvians and Estonians, to celebrate our rich ethnic heritage, enjoy happy events and commemorate the sad ones. The Latvian Center plays a critical part in maintaining our quality of life and wealth of our cultural diversity in the Pacific Northwest.

I understand that the region must move forward in developing alternate transportation schemes to the automobile and that the Latvian Center sits along the route devised for Sound Transit's light rail line between Lynnwood and Northgate. From my perspective as an engineer, the "at-grade option" would certainly be the most economical in terms of simpler construction complexity, lower long term maintenance costs and overall safety than the "elevated option".

Regardless of the final scheme, I respectfully request that all potential impacts on the functionality and viability of the Latvian Center during and after construction be carefully identified, evaluated and resolved well before breaking any ground at the Center. Significant impacts would include:

- preserving access to the Center
- minimizing noise, dust, runoff and other environmental hazards
- maintaining parking space quantity that the Center's users require

The possibility of relocating the Latvian Center (as was done once before) would unfairly impose punishing burdens on all the members of the Latvian, Lithuanian and Estonian Communities in this region and should not be considered a viable option in these difficult economic times.

In your reviews, determinations, planning and execution of this project please bear in mind the spirit of a simple door sign in my Boeing office conference room -

1

I-474-001

Thank you for describing the importance of the Latvian center to you and the Baltic community.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Sound Transit will avoid or minimize project impacts as described in the EIS: Section 4.6 (air quality), Section 4.7 (noise), and the rest of Chapter 4. The project would modify the church's parking, but the supply would be maintained.

I-474-001 "PLEASE LEAVE THIS PLACE IN THE CONDITION YOU FOUND IT OR BETTER". I would hope that Sound Transit will first try to make things better.

Sincerely,

Joseph G. Petkus

Subject: Latvian Church and Community Center

Importance: High

Dear Pat McCarthy,

I-475-001

I am writing to you in deep concern about the possible destruction of the Latvian Center and Church. The Latvian Church and Community Center is a historical building for the Latvian Community because it was designed and built by the Latvian Community. This building cannot be replaced. Because of these buildings have been the center of the Latvian community for over 40 years many elderly Latvians have established there homes within walking distance. Historical events are held at this Church and Community Center that allows the Latvian,Lithuanian and Estonian culture to flourish. Not only is this a Latvian historical building but, many other communities relies on this location for important events some examples are: Latvian Fraternity meetings, Latvian, Estonian and Lithuanian celebrations, Baltic Studies program meetings and fundraisers, Church, Latvian dance groups, weddings, presidential visits, school for the children, group meetings,choir, cultural celebrations etc. The Baltic community has a very rich culture and importance of history and traditions.

The many people rely on this historical building to continue the culture of Latvian, Lithuanian and Estonian cultures. If this building is destroyed or access is limited to this historical site the culture of the Latvian, Lithuanian, and Estonian will be endangered.

Do not allow the historical Latvian Church and Center to be destroyed. The Latvian people have worked endlessly to build a center that provides the Baltic's a historical location to continue the culture. If you allow this to occur a historical building will be lost and culture of the Baltic Community.

Paldies-Thank you,

Cynthia Phillips

Subject: Comments Regarding Lynnwood Link Light Rail and Latvian Church and Center

Greetings,

I-477-001

While only recently introduced to the Latvian community, it became abundantly and immediately clear what a positive and critical impact the Latvian Lutheran Church and community center has on the generations of Latvian-Americans in King County (and beyond) that use and depend on it.

Talk, and better yet, listen to young and old tell stories of people renewing and being strengthened by their faith, children being educated, families and friends meeting at a long-since familiar place, a strong culture being preserved, and I'm sure you'll agree that this is not simply another building whose disposition can be determined quite so easily.

While all in greater Seattle certainly understand the importance of light rail, we ask that all consideration and effort be given by Sound Transit to not just minimizing the impact of light rail, but ensuring that the Latvian Lutheran Church and community center can continue and thrive in peace.

Specifically, this consideration should come in the form of:

- Actively working and consulting with the church and community center in ensuring that there are no access restrictions to the property during any and all phases of planning and construction. This should include, prior to any work being done, providing (at a minimum) an equal number of close, off-street parking spaces as currently exist.
- Construction noise being kept to a minimum.
- Construction debris/dust cleaned up regularly.
- The trains being slowed to the absolute most minimum speed as they past by the center as to minimize noise.

I thank you for your time and consideration.

Kirk Pittman

I-477-001

Thank you for describing the importance of the Latvian Lutheran Church. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall, during construction and operation of the project.

For construction, the local construction noise ordinance would be applicable, and Sound Transit is committed to maintaining construction noise levels within the criteria. For operation, noise walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. See Section 4.7 of the Final EIS for proposed noise mitigation.

Sound Transit would mitigate debris and dust during construction. Please refer to Section 4.6 in the Draft EIS for more details on air quality and specific mitigation commitments.

Sent: Sunday, September 22, 2013 8:11 PM
To: Lynnwood Link DEIS
Subject: Comments on the Draft DEIS

Dear Sirs:

I would prefer to see a train station at 145th instead of 155th for 3 main reasons:

I-478-001

1) I think a station at 145th would be desirable since it would have I5 access. If other station parking areas start filling up, people will start using a different station where there is more parking. If that station is in Lynnwood, they probably would head for another station with easy access, such as at an I5 exit. That won't be the 185th station or the 155th station. If 155th starts filling up, to get to 185th, they would probably start using some smaller streets like 5th and 15th causing a lot more traffic on those roads. If the station was at 155th, then there would be no Shoreline station with an I5 access.

I-478-002

2) If there were a station at 155th, I would be concerned about pedestrian, and in particular, child safety due to increased traffic along 155th. Just a few blocks east of the station on 155th is Paramount Park with a picnic area and skate park right on 155th. Just a few blocks west of the station is Twin Ponds Park and a little further west is an elementary school both of which are on 155th.

In addition, currently in the morning when school starts and in the afternoon when school ends there is a stretch along 155th in front of the school that requires traffic to slow to 20 MPH. I wouldn't want to see train riders ignoring those speed limits and putting children in jeopardy in order to catch a train.

I-478-003

3) If the station were at 155th, it does not seem wise having it right next to a fire station.

I am concerned about pedestrian and bicyclist safety around the fire station. Pedestrians and bicyclists might take shortcuts getting to the train station, going through areas they should not be near in the event of a fire or emergency.

Commuters might be annoyed because they missed a train while their car was waiting for fire engines and/or emergency vehicles. The trains will be running on schedules but fires and emergencies do not.

Thank you,
Liz Poitras
Shoreline resident

1

I-478-001

Your preference for a NE 145th Street Station is noted. The Sound Transit Board identified the 145th Street Station as part of the Preferred Alternative, and not the NE 155th Street Station.

I-478-002

Sound Transit will work with local jurisdictions to determine the most appropriate treatments to provide for safe and effective pedestrian access to and from the station and for students and other pedestrians around the station. See Section 3.2.8 of the Final EIS for long term safety impacts.

I-478-003

In the design and development of a station at that location, and the management of traffic serving the station, Sound Transit would work closely with the Fire Department to resolve any potential conflicts with bus and vehicle traffic to ensure that emergency response times would be maintained both during the construction period and operation of light rail. See Section 4.14 of the Final EIS for impacts and potential mitigation measures on public services, safety, and security.

Mr. Priidik,

Thanks for your comments. I have forwarded them to the email inbox for formal comments on the Lynnwood Link Extension DEIS and they have been submitted for the public record.

Your comments are appreciated.

Regards,

Roger Iwata

Subject: Lynwood Link Light Rail

Dear Mr. Iwata,

I-479-001 I just wanted you to know that I am not in favor of this Light Rail extension if it means that the Latvian Church of Seattle will be destroyed. This Church has been there for many, many years and is very important to the Latvian, Estonian and Lithuanian communities. The destruction of this Church (in it's present location) is not worth the "progress" of light rail to Lynwood.

Thank you.

Albert E. Priidik

I-479-001

Thank you for your comments about the potential impacts to the Latvian church. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Lynwood Extension of Light Rail

To Whom it May Concern,

I-480-001

I am not in favor of the Lynwood Light Rail extension, if it means the demolishing of the Latvian Church in Seattle. This church has been in it's present location many, many years and is very important to the Latvian, Estonian and Lithuanian communities of Seattle. Mass transit to Lynwood is not worth the demolishing of the Latvian Church.

Please come up with another solution to Light Rail extension to Lynwood.

Thank you.

I will preface this by saying that I am a San Francisco latvian. I moved to Seattle in 1980. However, I had traveled to Seattle a number of times previously for some latvian functions, i.e. the West Coast Latvian Song Festival held in Seattle in the summer of 1975, a West Coast Latvian volleyball/basketball tournament in the spring of '75, as a member of the latvian singing group 'Līča Vēji'. Through various latvian functions up and down the west coast (Los Angeles, SF, Portland, Seattle) I did not arrive in Seattle fresh off the boat, but had a good group of latvian contacts and friends when I moved.

We call it the 'Latviešu Nams' which is the 'Latvian House'. Just like when you are growing up, your house is the center of your life and activities, parents, family, relatives, and friends. The Latvian House (and it's previous incarnation in Seattle) was and is our cultural and spiritual house where most of the area Latvians were raised in, a home away from home. Raised in by our WWII DP (displaced persons) parents, coming to America with young kids to start a new life or like me, a '50's first generation kid born in America to these Latvian parents.

Christmas service, Candlelight, Easter, the Latvian Independence Day, baptisms, confirmations, weddings, or memorial services. Rehearsals and staging for in-house Latvian theater or actual theater troupes from Latvia. The Latvian choir getting programs ready for the holidays or to travel to the West Coast Latvian Song Festivals, or the national US or Canadian Latvian Song Festivals. The folk dance group Trejdeksnitis practicing and getting ready for the same or performing at the Folk Life Festival or at one function or another at the UW. The local singing group Staburadze, the Portland singing group Dzintars, a 'friendly' basketball/volleyball match between the Seattle Latvians and the Australian Latvians as they traveled to 'Garezers', in Michigan, for the Latvian Sports games in the mid-80's..

Many an hour was spent at home as a child doing my Latvian homework, a school attended on Saturdays. Language, history, literature, catechism, latvian culture were all taught at this school. I did not find it odd that my grade school friends had Hebrew school or their Catechism classes

I-481-001

Thank you for describing the importance of the Latvian Church and center to you and the Latvian community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained during construction and operation of the project.

I-481-001

during the week. My wife Lisa attended her last years of Latvian school at the present site of the Latvian House. Both our sons graduated from Latvian school here, at the end of their 8th grade year. With both boy's dancing in the folk dance group 'Trejdeksnitis' and now out of high school, our family of four made the first time trek to Latvia this summer for the Latvian Song and Dance Festival.

My wife and I were married here in the Latvian Church, both our kids baptized and confirmed here. Our kids did the 'Latvian' stuff, 10 years each at the Latvian summer camp 'Mežotne', now as camp counselors. They spent two or three summers at the Latvian teen camp 'Kursa'. The West Coast Latvian Education Center located outside of Shelton, Wa. was built by many of the same hands and their sons and daughters, that built our current Latvian House in the early '70's. Currently (or near) Trejdeksnitis had a spring fundraising dinner and dance program, as they headed off in July to participate in the actual Latvian Song and Dance Festival held in Riga, Latvia. The SLGA just finished their 13th Annual golf tournament at the Jackson Golf Course, with an awards and steak dinner at the Latvian House. The Latvian kid's school just started, the President of Latvia, Andris Bērziņš, just visited. In October we have the Harvest Festival brunch, also various individuals and groups are preparing for the November Christmas Bazaar, and of course the 18th of November, Latvia's original Independence day. Church services are most every Sunday, on occasion in English.

All these events are directly involved with or indirectly made possible by each and every function that goes on at the 'Latviešu Nams'. This is a place to go back to when you've been away. I can reasonably, without a doubt, say that you can apply these functions and events to just about any larger west coast city where Latvians congregate at their 'Latviešu Nams'.

Personally speaking, a yearlong interruption or a claim of Eminent Domain would be a death knell. What we have now provides sustainability for the local Latvian population, it's an attraction for out-of-towners, another facility for national or international Latvian troupes or groups. It provides fuel to run the only children and teen Latvian summer camps in the Western United States, down in Shelton. In the end it would not be good.

Thank You

1 - The Trejdeksnitis folk dance group that went to Riga, Latvia this summer.
2 - Wife and son Julijs (L), and Julijs' friend Peter working at the Latvian Christmas Bazaar last November.
3 - Julijs after his confirmation at the Latvian Church.
4 - Older son Krisjanis after his confirmation at the Latvian Church.
5 - My wife Lisa's confirmation at the same Latvian Church.
6 - Lisa's mom after her Latvian confirmation service in Seattle, before the current Latvian Church building was built.
7 - Krisjanis and his two best latvian friends (Alex and Modris) at 8th grade Latvian School graduation.
8 - Julijs and his graduating class.
9 - This year's Mezotne summer camp with many future Latvians of the NW. The Littlebird parents at one time were attendees when the camp was still up at Camp Waskowitz in North Bend.
10 - This is a 519 page book published in 2011 about the various activities, organizations, and groups that were/are a part of Northern California latvian community, basically from postwar

immigration in the 1950's onward. Theoretically you could apply this type of voluminous history to Seattle, Portland, Vancouver, BC and so on. Our parents and grandparents accomplished a lot coming here with just a couple of suitcases.

Subject: Latvian Center- Northgate

I-482-001

The Latvian Center has been a huge part of my life ever since I was a young boy. Attending Latvian Saturday School for 10 years and meeting some of my best friends. I have participated in the Latvian dance group Trejdeksnitis for the last 3 to 4 years and this past summer we went to Latvija to dance in the Latvian song an dance festival. None of that would have happened if we didn't have our Center. It's where we can keep our culture and traditions alive. I would feel as though a piece of me would disappear if we were to lose the center. This center helps not only us but the other Baltic countries keep some traditions going. Losing the center would only weaken our community which has already been moved from our original location years ago. We may not live in Latvija this helps us keep our little piece of Latvija together.

Thanks,

Krisjanis Pruzinskis

Subject: Lauren Swift - SAVE THE SEATTLE LATVIAN EVANGELICAL LUTHERAN CHURCH/CENTER

I am writing to save the Seattle Latvian Evangelical Lutheran Church/Center! When I first heard of the sound transit planning a light rail many months ago, my initial thought was that it is a good idea, and am happy that public transport is growing in America. But, when I learned further that it would possibly run through the Seattle Latvian Evangelical Lutheran Church/Center, I became sad and thus writing this letter.

I myself grew up in Los Angeles, but spent all of my summers in Washington, where there is a Latvian summer camp. Being at summer camp, from time to time, we would travel to the Seattle Latvian Center to perform the folk dances we learned, or sing, or meet other groups visiting from Latvia. Most of my Latvian friends had grown up going to the Center for Latvian school, they participate in the folk dancing group, they sing in the choir, and they go to church. I had the joy to fly up from time to time to visit their Latvian school, and attend my friends' confirmations later. I had the pleasure of being there a couple years ago again for my godson's christening.

I-483-001

I personally realize how important such a center and church is to a community - because growing up in Los Angeles, I attended both. Now I live in Norway, and can't say how much it is missed. Although there is a Latvian community here, we do not have a center or a church. It makes it a lot more difficult to regularly meet because of not having a center or a church that is easily accessible for all the cultural things. It isn't easy to find halls for the folk dance group to have their practices and performances in, it isn't easy to find rooms for the choir to meet, and isn't easy to rooms to hold Latvian school on Saturdays/Sundays...non the less to have regular church services. With not having a church and center, there is less motivation for Latvians here to meet, then less motivation to teach our children the language, the traditions, the culture. The Latvian community in Seattle has the benefits to accommodate all the needs to help the culture thrive outside of Latvia. To take away their community center and church would be absolutely detrimental.

Please find a solution that would allow the center and church to remain at the current location.

Kind regards,
Brigita Pukite

To Whom It May Concern,

My name is Ilze Puķīte, and I am you writing regarding the Lynwood Link DEIS issued July 26, 2013. It may surprise you that a comment regarding this situation is arriving from California, but I hope you will nonetheless take my opinion to heart, even though I may not be a member of your voting block. It is my sincerest hope that the time I take now, to write you from over 800 miles away, is not wasted, but helps to bring to your attention the importance of the dire situation which you have created for the Seattle Latvian Community Center.

I-484-001 The Latvian community is one of the most closely knit communities I have ever had the honor to be a part of. Our culture is a small one, and our home country of Latvia has a population just barely topping 2 million – less than a fifth the size of LA. However, our people are strong, and united. When Latvia was occupied by the USSR, thousands of Latvian refugees fled the country, and many found save haven in the United States. There, we found solace in each other, and vowed to keep our language, traditions, and history alive, despite the tragedies back home. To this end, we created Latvian Centers all across America – including Seattle.

I-484-001

Thank you for describing the importance of the church and center. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-484-001 These community hubs served as schools, dance centers, churches, choir halls, and homes. They host everything from Christmas bazaars to rummage sales, to folk dance performances and evenings of song. I have fond memories of the Latvian Center in Seattle, when my mom and I would occasionally drive up from Portland, where I grew up, to participate in an event or see a Latvian group performing. These centers provide so much for the communities they serve – they inspire children to take pride in their heritage, they give our seniors opportunities to socialize, and they unite us as a community.

I do not doubt for a moment that the proposed changes – whether "just" losing ingress/egress and parts of the lot, or losing the property as a whole – would be devastating to the Seattle Latvian Community. While I am absolutely supportive of public transportation expansion, I wonder if there are no possible alternatives to this. It is, quite frankly, shocking to me that this plan has gotten so far. I wonder that at no point during the propositions for this expansion did anyone think to wonder what this building was, and, if they did inquire as to its usage, did they really think it should be razed nonetheless? Were this new construction going to have to go through a 7-11, well, I think the world would be quite indifferent, as there is one on every corner. Of Latvian Centers, however, we have very little, and the community it supports would be very hard pressed indeed to find a replacement, let alone afford the move.

I sincerely hope that the efforts of our community to reach out to you do not go in vain. I am certain that we can find a solution that will no longer put the Seattle Latvian Community Center in peril, and I hope that you will take the necessary steps to protect this dearly loved fixture of the community.

Sincerely,

Ilze Puķīte

Subject: Comment in favor of C3

Dear Sound Transit Board:

I first read about the proposals to extend the light rail to Lynnwood in the September 2, 2013 edition of The Seattle Times. Based on that report, I was concerned that a valuable park in my area would be damaged, when other options were available. My preference, other things being equal, would be to preserve the park as it is.

I am a resident of Edmonds, but I often visit Lynnwood, either to walk in the parks or shop at the stores. I appreciate what Lynnwood offers to Snohomish County.

I am a customer of Sound Transit. During a typical week, I ride the Sounder to Seattle five times a week; and, of course, five times back again to Edmonds. I appreciate what Sound Transit offers to Snohomish County.

I-486-001 I have examined the alternative routes for segment C of the light-rail extension, according to the DEIS, as well as the impacts listed as Potential Property Acquisitions and Displacements (Table 4.1-1). It seems clear that, beyond my preference for preserving natural areas, alternative C3 is the most practical alternative: it is the shortest, most direct route, and it affects the fewest parcels.

Please choose C3.

Thank you.

Sincerely,
Douglas Resnick

Dear Sound Transit Board c/o Lauren Swift,

I-487-001 I'm a resident of Lynnwood and have earnestly followed the DEIS from Sound Transit and the comments of Lynnwood citizens. I have also attended several meetings and have studied the DEIS to some degree. I favor the C3-Modified as presented by the City of Lynnwood. C1 and C2 are simply too intrusive and disruptive to our city, to homeowners, to businesses and to the ecosystem. C3 has some problems too and has the terminal too far from boarders. C3-Modified corrects many of the challenges of

With that said, I would hope that the engineers and planners keep looking at ways to perfect C3-Modified. Since the track it is a permanent structure, please make it as citizen friendly as possible to our eyes, to our ears and to the landscape. Please also take into consideration where it would need to depart if ST3 is approved and what the disruption would be there.

I-487-002 Please also take seriously the traffic impacts associated with 20,000 riders per day. I don't believe that most of them will come by bus.

Thank you so much for bringing light rail as far as Lynnwood. Overall, it will make it better for us in the long run.

Sincerely,

Sid Roberts
Lynnwood, WA 98037

1

I-487-001

Thank you for your comment stating your support for Alternative C3 as modified by the City of Lynnwood. This alternative was not evaluated in the Final EIS; however, elements of the alternative have been incorporated into the modified C3 Segment C alternative evaluated in the Final EIS. Please see Section 2.3 for an updated description of the refined Segment C alternatives currently under consideration by Sound Transit.

I-487-002

A traffic analysis was performed for the Lynnwood area taking into account the additional 500 parking spaces that are provided at the station as part of the project. Sound transit will work with the City of Lynnwood to provide mitigation for traffic impacts caused by the project.

I-488-001

I am commenting on the Lynnwood Link DEIS issued July 26, 2013. I am a member of the Seattle Latvian Community, whose Community Center and Church at 11710 - 3rd Ave NE in the Northgate area of Seattle, is slated to have tremendous impacts with any of the alternatives presented to date. The property would either be acquired in total or lose ingress/egress, as well as the caretaker's house and a significant section of parking and entrance areas. More significant, will be the impacts to the Latvian and other Baltic Communities – not just in the Northgate area, but all throughout Seattle and the surrounding area, and in some cases, throughout the West Coast.

The Seattle Latvian Community Center and Lutheran Church, over the last 40 years, has become the vital epicenter for preservation of Baltic (Latvian, Estonian, and Lithuanian) culture, religion, education, and social interaction in the Pacific Northwest. It has also become a political symbol, representing our success in resisting Soviet occupation, preventing "Russification", and restoration of democracy in the Baltic republics. Historically, the Center has hosted several visits from Baltic presidents, Seattle mayors, and Sen. Henry M. Jackson. The beautifully designed church, community hall, and school, are a source of pride for the Latvian community, because it was built by their own hands – their own donations, volunteer labor, and skills. Today, the Center also serves as meeting place, and source of information and "networking" contacts for new immigrants from the Baltic countries.

I was born, raised, and educated in Seattle. For me personally, the Latvian Community Center & Church greatly influenced my life, and continues to do so. My father was one of the primary Latvian activists and community leaders, that guided the development of the Center in the 1970's. The Center was intended to serve the Latvian community, and our children's children. As a teen, I worked on the construction of the church and school – as did many of my relatives and friends. As soon as the Center was completed, our family relocated from Magnolia to Northgate, so that we would be close by. As a youth, I attended the Latvian School and Lutheran Church there. During weekends, I learned the Latvian language, history, literature, religion and culture. Even while studying at the University of Washington, most of my extra-curricular activities (music, folk dancing, traditions, social events) were at the Latvian Center – regularly, several times per week.

Looking forward, if the Latvian community were to lose access to this Center - I'm not so worried about the impacts to myself – but more for the youth of the community. My loss would probably be limited to a disruption in social, cultural, and religious gatherings. For the youth, the loss will also be

1

I-488-001

Thank you for describing the importance of the church and center. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-488-001 educational, and developmental – which will be unrecoverable, if the disruption due to relocation/re-construction lasts several years. Without a "home", this gap could cause a loss of "critical mass", and the Latvian community membership and activities could severely decline.

There is already a precedent for this kind of disruption to the Latvian community in Seattle. The first Latvian Center in the Wallingford area of Seattle was acquired by eminent domain in 1969 for the construction of a park. This first Center was a run-down, old building that had been purchased, so was perceived by some as a "call to action" – that the Latvians should build their own community center. Many still remember the difficulty in keeping the church, school, and cultural activities going in various rental spaces, during the interim years of 1969 until 1972, when the presently used Center was opened, Since the level of activities and pride at our present Center are much greater than in the past, and the same Center is also key to Estonian and Lithuanian communities in Seattle, I believe the impacts will also be much greater. This time they will be demoralizing, and devastating.

I urge the Sound Transit board members, engineers and planning committees to find a solution that allows the Latvian Community to retain its present property and location in a way that maintains its viability. If our community should be forced to relocate yet again, I feel it would be an insurmountable challenge.

Thank you for your consideration. I truly hope a reasonable solution can be found.

Sincerely,

Ed Rusis

Sound Transit
Draft EIS comments
c/o Lauren Swift

I-489-001

I am commenting on the Lynnwood Link DEIS issued July 26th, 2013. I am an active member of the Seattle Latvian Community , whose Center is at 11710 3rd Ave NE in the Northgate area of Seattle. The property is slated for monumental impact with any of the options presented to date.

I was born in Seattle in 1964 and I have been a part of this community and Church which has greatly influenced my life and family. It's our place of worship, community, sanctuary.

In 1969 we lost our church to eminent domain in the Wallingford area. The result of this is the present day Latvian center... it was built by the community... including my family. It is an example of what the Latvians wished their country to be: Free, open, democratic and safe. The Country of Latvia now has these rights, in part, due to centers like this where ex-pats were able to gather, discuss and even vote for change in their home country. However today, the Church and Community has grown to a size that would make it extremely difficult to move and have it survive for those it serves. Many families have relocated there over the years to be near the church and hall. The loss of the church to the elderly would be insurmountable. The loss to the youth of our community would be unrecoverable and this disruption devastating to my family, our community and the Latvian people.

For the record, I am a huge supporter of Light Rail. Having traveled throughout Europe over the years I know how important this is to our community in so many ways. We do want to see Light Rail succeed.

I do not envy you and your team in this process of evaluating the best solution. What we do need is a solution that will be the best for all involved, and that would have to include the Latvian Church and property staying there and available to its members and friends as it has for so many years.

1

I-489-001

Thank you for describing the importance of the church and center. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. To: Lynnwood Link DEIS
Subject: Please don't displace the Latvian Church and Center!

I understand that this is a day late – our server kicked it back and I am trying again.

The Latvian Church and Center represents much more than just a church, more than just a gathering place. I grew up near Martha Lake and spent a good part of the 70's and 80's travelling up and down I-5 to the Center for Latvian school on Saturdays, folk dancing on Wednesday nights, church on Sundays, Concerts, holiday bazaars, rummage sales, men's choir... the list goes on. I was married there, I first met a US Senator there (Scoop!), I saw Lithuanian and Estonian performers there, and it has grown to to be the heart of our entire extended Baltic community today. Due to service in the Air Force, I was away from Seattle for almost twenty years, but the Center today is the hub of a community as strong as what I remember from my youth.

When I was a kid, the "Latvian Community" was a homogenous, Latvian speaking community centered on its cultural connection. Today that community is just as vibrant, but the Latvian Center rings with all of the Baltic languages, as well as English (mixed with Latvian!) with visits from Baltic Studies Program students from UW, non-Latvian speaking spouses and friends. But all come to give and to get, what it is that makes this a special place in our community.

I-490-001 I would only hope that the discussions currently taking place are all focused on how best to find an amenable solution that keeps the center where it is. Displacement should not be an option. As an Engineer and supporter of infrastructure that will make our city a better place to live (including light rail), I know there has to be a solution that keeps the Latvian Center functioning as it does, where it stands, with minimal disruption. Please don't lose sight that the Latvian Center is also part of the structure that makes Seattle a great place to live.

Thanks.

Andy

Subject: Lynnwood C1/C2/C3 alternative - NO to C1

Please consider and address before making a decision regarding the Lynnwood Link Extension C1/C2/C3 alternatives:

I-491-001 The C1/C2 alternatives proposed by the Sound Transit as possible options to route the Light Rail Link are simply unacceptable for our neighborhood community, for our beautiful local environment, and for our working business professionals. There is the C3 alternative - one that makes perfect and clear sense. The C3 alternative is the rational and responsible way to route the Light Rail Link for current and future use. Below is a list of explanations and concerns that support these statements.

I-491-002 First and foremost, the C1 alternative is the most intrusive and the most negatively-impacting route choice. It is a very unnecessary route to follow while building the Light Rail Link. Sure, it may be closer to the "Lynnwood City Center" and it the final stop would be serving the highest amount of people within a walking distance. However, Lynnwood City Center is something that actually doesn't exist. The Lynnwood City Hall sits empty, and council sessions bring a handful of people in. The Lynnwood Pool is a destination - yet because it is more than 1 mile away from the C1's proposed final stop, it would not make a difference regarding the C1/C2/C3 final stops, as just a hundred yards that would separate these stops make no difference to those who would walk that far. As far as walkability for local residents - they will definitely NOT be the primary users of this mode of transportation. The vast majority of people who come to the current Lynnwood Transit Center DRIVE, and will continue to do so! Having a stop a few hundred yards to either direction makes no difference at all!

I-491-003 Secondly, the current amount of high-density living, shops, businesses, and a beautiful Scriber Creek Park, designated a 4F and federally protected public space will suffer tremendously. With the C1 alternative, 77 high-density private residential units will be demolished. In our current day and age, real estate is not easy to come by in a metropolitan area, as everything is already developed. Choosing the C1 route will uproot a close-knit community of neighbors, retired seniors, young professionals, and young families. With the C3 alternative - this will be unnecessary. Furthermore, due to the fact that the C1 alternative has a route that goes directly through a single-family dense neighborhood, a lot more families will be affected by the visual, noise, and construction effects that come with this project.

1

I-491-001
Thank you for your comment stating your preference for Alternative C3.

I-491-002
Thank you for your comment stating your reasons for opposing Alternative C1.

I-491-003
Thank you for your comment stating the reasons you do not support Alternative C1.

I-491-004 Third - the Scriber Creek Park (as mentioned previously) is a federally - protected park. It was purchased with Futures Conservation Fund - SO THAT FUTURE GENERATIONS COULD ENJOY THIS TRANQUIL PLACE. It is a neighborhood mini-park. The C1 (and the C2) route directly negatively affects this park, its usability, and its fundamental beauty. The C1 alternative route has a plan to purchase ½ acre of this park - the absolute-most usable part of the park, with picnic benches, open areas for human congregations, and so on. The C1 alternative has a plan to route the Light Rail Link directly over this pristine land, thus making the park fundamentally different in every way, shape, and form. It is important to note that this park has ancient bogs, a creek that runs to Lake Washington, becoming a habitat to a vast amount of wild life. Running rail over this land, developing it during construction, and maintaining light rail above this land is unfeasible - basic understanding of this is before our eyes.

I-491-005 As the C1 proposed path continues on north - east toward its final stop, the plan would be to demolish high-density business parks, as well as one more very dangerous place - a HazMat site. The only hazardous materials site anywhere in S2 Light Rail link extension from Seattle to Lynnwood is impacted - with the C1 alternative. This is a very dangerous situation, where choosing C3 alternative will definitely avoid it.

All the aforementioned negative impacts the C1 alternative brings with it make this a very unrealistic choice to route the Light Rail in Lynnwood. Seriously consider just a small handful of concerns that come with this project, as you make the decision to build the Light Rail route from Mountlake Terrace to Lynnwood. Choose the C3 alternative when you plan to build the Light Rail in Lynnwood.

Sincerely,

Gleb Shein
tallgleb@hotmail.com
253-951-1812

I-491-004

Thank you for describing the importance of Scriber Creek Park and your desire that Sound Transit avoid impacting it. Section 4.18 describes the results of the Section 4(f) analysis Sound Transit and FTA have conducted, indicating that Alternative C1 would not be approved in its current form due to the acquisition of and impacts to the park.

I-491-005

Thank you for your comment stating the reasons why you prefer Alternative C3 over Alternative C1. Sections 4.12.2 and 4.12.3 of the EIS analyze potential impacts due to hazardous waste sites. Mitigation measures are discussed in Section 4.12.6.

Subject: Latvian Lutheran Church

To Whom it May Concern,

My name is Aleks Sils and I have been an active member of the Seattle Latvian Community for virtually my entire life (23 years). I attended the Seattle Latvian School almost every Saturday for thirteen years as well as participated and assisted in a great number of cultural, religious, and educational events that were ALWAYS at the Latvian Hall.

I am currently a Graduate Student at Washington State University and as you can imagine I have been extremely busy, however I am taking this time to write to you and express my deep concern about the potential loss of our beloved church and center.

I-492-001 What needs to be understood here is that the Seattle Latvian Church is not just some small church with a short history. This property has been home to many years of Latvian school, cultural gatherings, weddings, freedom celebrations, town-hall meetings, and of course a healthy following of church goers.

In fact, my parents Vilnis Sils and Rita Ridzenieks met at the Seattle Latvian Hall some 24 years ago and my Grandfather, Karlis Ridzenieks built this church. Therefore, I owe my life to the existence of this hall.

I-492-002 I will ask you to please reconsider the current Link Light Rail route that would damage our ONE standing community center and church.

Thank you,

Aleks Sils

Subject: Effect on Latvian Center of Lynnwood Sound Transit Extension

To whom it may concern,

I-493-001

My name is William V Sils and I am a 61 year old Latvian-American currently living on Bainbridge Island. It has come to my attention that the proposed light rail extension to Lynnwood is likely to negatively impact the Latvian Center located just north of Northgate way. While I am generally in favor of providing mass transit opportunities to the public, I must caution the government entities involved with this project to keep in mind that minimizing the importance of the Latvian Center to the Baltic community would be a gross injustice.

Please add my voice to the many others that have contacted you urging care and consideration of the Latvian Center. As a community, we have a need to have a place where we can come together and maintain our cultural identity. The Latvian Center has functioned in this capacity for 50 years and should continue to do so for the good of the entire Baltic community.

Thank you for your attention to this matter.

Subject: Sound Transit - Comments Regarding Light Rail and Latvian Church and Center

To whom it may concern,

I-494-001

I am a member of the Latvian Lutheran Church and also the Latvian Community in Seattle. I am writing to you to express my concern regarding the impact of the proposed Sound Transit Light Rail line extending northward from Northgate. You have identified the need to build this link parallel to I-5 on the East side of the freeway which impacts our current community center and our church. While I understand the need to build the Light Rail and support the overall project, I ask that you consider any and all alternatives to find a route that does not impact our center.

I was a child attending the Latvian school in the Densmore/Greenlake area when we had to relocate to Northgate. I remember bringing pennies each week to Latvian school to save and help build our new community center. My deceased father, a brick mason, and my brother laid the brick and slate in the current Latvian church and school. To me it's more than a building. It represents the generation that fled their homeland after Soviet occupation and build a new community home.

I finished Latvian school in this new community center and was confirmed in the Latvian Lutheran church. I have also taught in our Latvian school and Sunday School. I cannot imagine us relocating again or impacting our current property to the degree that the initial designs have proposed.

As a long-time Seattle resident, I ask for your understanding of the importance of this church and community center. I ask for your consideration of our community, the entire Baltic community and the next generation of children being raised in this community. Please find a way for us to keep our church and cultural center, minimize the impact of noise from the light rail, and provide us access to the church and center such that we can continue church services and our cultural activities that on any given week can run 24/7.

Respectfully,
Aija Stapars, VP Human Resources
Wesley Homes

Subject: Comments for Lynwood Rail Extension

I-495-001 I am a resident in the Northgate/Pinehurst neighborhood and reside at 325 NE 117th St, Seattle, WA 98125 which is about one block away from the current East sound wall along 1-5. With the draft EIS published, it is clear from the report, that no matter what route is decided that my residence will be impacted greatly by the decisions made by the board.

I-495-002 First, I would like to state that I think that a high capacity bus alternative should be studied more as a possible solution as opposed to the link light rail. The associated cost of construction, realignment and residential property impacted with a no-build alternative is low compared to a Light Rail Extension.

I-495-003 However, It appears that the board will be moving forward with the Lynnwood Light Rail Extension and with a route along the 1-5 corridor per the results of the Lynnwood Link Extension Draft EIS. If that is the case, I would like to voice that I prefer an at grade option along the 1-5 corridor as opposed to an elevated structure. The elevated structure will have a very high visual impact for both neighborhoods east and west of I-5 and I as a residential property owner do not want to see a large concrete structure housing a train from my front yard that can be seen above the East Sound Wall. The Northgate neighborhood has had many cosmetic improvements over the last 10 years and is becoming more of an urban center and I think that an elevated structure that can be seen from residences along both the West and East-side of Interstate 5 will be counterproductive to the neighborhood improvements that Northgate/Pinehurst neighborhood has undergone.

I-495-004 My first and really only preference would be A1: At-grade/elevated to NE 145th and NE 185th east side stations. I prefer the at grade option over an elevated structure due to the lower visual impact, noise during construction (DEIS states that an elevated structure would probably require work at night and on the weekends due to interstate traffic) and the associated lower cost of construction. Station placed at 145th and 185th make more sense with the existing structures and projected ridership levels. I think that 3 stations placed at 130th, 155th and 185th will over-saturate the neighborhood and will delay ridership with an extra stop. A station placed at 145th as opposed to 155th makes more sense due to ease of access to I-5 from 145th as opposed to 155th.

I-495-005 A5 is not an at grade alternative that I would prefer as my neighborhood would be impacted by placing an at-grade structure east of the 117th overpass as opposed to moving the train under a re-built 117th overpass. A3 moves the light rail closer to my residential property than A1, and will disrupt the bike and

1

I-495-001
Sound Transit developed the alternatives considered in the Draft EIS based in large part on their ability to minimize acquisitions, displacements, and relocations, compared to other possible alternatives, but some property acquisitions will be unavoidable. Chapter 2 of the Draft EIS describes the other options considered during early planning, most of which involved higher levels of property or other environmental impacts.

I-495-002
Thank you for your comment recommending that a high capacity bus alternative be studied as a solution instead of the Lynnwood Link Extension project. In fact, this mode of transportation as well as other modes were evaluated, along with other corridors serving the north Seattle to Lynnwood area. This analysis is presented in detail in a separate report titled the *Alternatives Analysis Report (*Appendix K of the Draft EIS) and is summarized in Section 2.5 of the Final EIS. It was not advanced because it was less effective in providing the speed, reliability, and capacity needed in the corridor.

I-495-003
Your reasons for preferring at-grade alignments are noted. Visual impacts and mitigation are discussed in Section 4.5 of the EIS.

I-495-004
Your comment stating your preference for Alternative A1, which was the basis for the Preferred Alternative, is noted.

I-495-005
Thank you for your comment stating the reasons why you oppose Alternatives A3 and A5. The Preferred Alternative features an alignment east of the NE 117th Street bridge, but has refined the design to replace

I-495-005 pedestrian path used by local residents to cross over 1-5 to schools, parks and churches as the overpass will be untouched in this alternative.

I-495-006 I understand that the Seattle Latvian Evangelical Lutheran Church, which is about a block away from my house will be possibly forced to relocate, if an at-grade option for segment A (A1, A5 and A10) is selected. I also realize that the parishioners at the Latvian Church have fairly strong ties to the Church structure and most would probably prefer an elevated structure so the church is not displaced. However, as a residential property owner in the area that will be impacted, I and my neighbors will be the ones that live 24/7 near the link light rail extension and I think that our preference for an at-grade structure should be given more weight than the church members.

I-495-007 Once again, I think a no build alternative should be more seriously considered, however, if the Lynnwood Light-rail Extension is to proceed further my preference as an impacted property owner would be for Alternative A1, an at grade alternative as the associated visual impact is lower for both neighborhoods East and West of 1-5

Sincerly,

Zachary Stephen

Graduate Research Assistant

University of Washington

Dept of Materials Science and Engineering

sidewalks and the bike path to maintain the connections currently made.

I-495-006

Thank you for your comment stating your preference for the at-grade alignments of the guideway. The Segment A Preferred Alternative, and all at-grade alternatives now avoid displacement of the church, as described in Section 2.3 of the Final EIS.

I-495-007

Thank you for your comment stating your preference for the No Build alternative or Alternative A1.

Please forward this comment to the proper regulator as we understand this is last day for pubic comment.

I-498-001 We Scott Maria Eva Alexander and Anna are opposed to your light rail transit expansion if it in any way damages, imperils or condemns the Latvian church or community center Our Lithuanian family has spent much time celebrating our Baltic culture with the gracious assistance of the Latvian Community at this location over the past 3 decades. Taking this property from the people like our parents in laws and grand parents who saw Stalin and Hitler take their possessions countries and lives is at best ill advised and at best insensative.

You need to provide recompense for relocation at an. amount that is realistic to resettle rather than split this property.

We have lived in Seattle since 1981.

Subject: Feedback on Draft EIS - Segment A

I-499-001 I live in Seattle about a half-mile west of the site of the potential Segment A Light Rail stop on 130th Ave NE. I recommend putting a stop at that location, so I endorse options A5, A7, A10, and A11. This site makes the most sense to me as it would be far easier for my community (Haller Lake) to access light rail instead of needing first to commute south to the Northgate Transit Center, and transit options could also link the Bitter Lake and Lake City communities with the 130th Ave light rail stop. A potential stop on 145th would not be as easily accessible to Bitter Lake or Lake City residents, and I know that these are the urban villages where the City expects to concentrate future development.

I-499-002 That said, I am also concerned about additional noise from construction and subsequent operations that a 130th stop would bring to the neighborhood, as well as what the options would be for park&ride

I-499-003 commuters. I suggest that the recommended option consider how to best mitigate the potential negative effects on the neighborhood, by selecting the option (at/grade or elevated) that would be least disruptive to the neighborhood and which option would offer suitable parking for commuters (to limit the number of commuters parking on neighborhood streets).

I-499-004 My take on the alternatives is that A5 (at-grade stop at 130th NE, with 100 parking spots) would be the best option given my concerns.

T.J. Stutman

1

I-499-001

Thank you for your comment stating your preference for a station at NE 130th Street (over a station at NE 145th Street) due to improved access for residents living west of the I-5 highway. A station at NE 130th Street was identified as an option for the Preferred Alternative by the Sound Transit Board.

I-499-002

For construction, the local construction noise ordinance would be applicable, and Sound Transit is committed to maintaining construction noise levels within the criteria. Further, construction noise for this project is similar to construction noise for a paving project, building construction, or any other construction project. Best practices and mitigation measures are described in Section 4.7.

I-499-003

The 130th Street Station is included as an option being considered in the Final EIS. Station parking facility sizing and design will be balanced with the need for good multi-modal connections in order to serve the needs of the region as well as local communities. Minimal parking is anticipated to be provided at a 130th Street Station should it move forward.

I-499-004

Thank you for your comment stating your preference is for Alternative A5 considering your primary concerns.

Subject: Latvian Cultural Center

Sound Transit;
ATT: Lauren Swift

I-500-001 My family have been members of the Latvian Lutheran Church of Seattle for 15 years. Since moving to this area we have attended worship services and celebrated all life affirming events at the Latvian center. My children attend Latvian school at this location, have sung in the chorus, danced in Christmas performances, and performed in school plays. This is more than a church and an assembly hall.
The cultural aspects of this Center can not be overstated. Latvians, Lithuanians, and Estonians throughout the Northwest congregate at this location to share their rich heritage with children and the community at large. The recent visit by the President of Latvia is a good indication of the importance of this Center. The fact that it is also recognized as a voting location for national Latvian elections, is another indicator as to the importance of the Center.

I-500-002 The taking of the land the Latvian Center stands on can not be valued by mere dollars and cents. Disrupting events and worship services would likely result in the demise of this culture in the pacific NW, and cost the Northgate community one of the things that makes it a diverse and ethnically rich community.
If the minimal information provided in the Sound Transit Lynwood Link Extension DEIS is to be believed, either the raised or at grade option would be disruptive to every event held at this venue. Neither church services, school, nor any sort of cultural performance could be held with trains rumbling past every 4-7 minutes. I am sure that this will be self evident when the Sound Transit Board visits the site and observes the proximity of the proposed rail line to the Center. Will the Sound Transit Board visit this location that is so important to the community at large?
I ask that the Sound Transit Board reconsider the proposed location for the Lynwood Link Extension. Moving the rail slightly west, away from the Latvian Cultural Center located at 11710 3rd Ave NE, Seattle, WA, 98125, more onto WSDOT land would be much less disruptive to the community as a whole, and likely save taxpayer monies.
I support enhanced public transportation, but feel that the Sound Transit Lynwood Link Extension DEIS has not adequately explored the options available to the location of the rail line or considered the true life impacts of the current proposal. Moving forward with a plan that is not well considered will only lead to bad policy, and further community resentment.
Sound Transit's job #1 should be to enhance the community they are trying to serve, not taking an option that is detrimental to the communities they are working in.
Please Respond.
Sincerely,
John M. Sulcs
8921 41st Ave SW, Seattle, WA, 98126

Sound Transit

The Latvian Community Center and Church, used by Estonians, Latvians, Lithuanians, is in danger to be impacted due to the routing of the Sound Transit Link. For years the Church and the Center has been used by the whole Baltic community residing in the greater Seattle area. In addition to regular Church Services, performances of Weddings, Baptisms and Memorial services, the Center has been utilized for our Independence Day, Mother's Day, St Martin's Day, Christmas celebrations etc. It has been available for Baltic Exhibits, Folkdance and Choir practices.

I-501-001 Any disruption to its availability, weather temporary or permanent, will either severely disrupt our Baltic community or eliminate its existence.

As an Estonian of the Baltic community, I urgently request that Lynnwood transit consider route alternatives that will preserves the Latvian Lutheran Church and Community Center, most precious for me and my family.

Sincerely,

Karl Taht

Subject: Please save the Latvian Church and Community Center

Hello,
I am a member of the Lithuanian community and I am writing to you to regarding the Latvian Church and Community Center. The Latvian Community generously allows our community to utilize its facilities. We often also host group programs with the Estonian, Lithuanian, and Latvian community together.

I moved to Seattle 6 years ago and was delighted to learn of the Lithuanian community and this Community Center. Connecting with the Baltic people at the Latvian Church and community center has greatly enriched my life here in Seattle. I have attended St Martins festivals, Independence Day Celebrations, worship service, funerals, and Memorial Services for the Anniversary of the Deportation of Baltic People to Siberia
(some of which my family endured). I am also part of the Lithuanian singing group, and we often perform at the Latvian Church and Community Center. I participate regularly in these events at this center, and it has brought me a great personal connection to my family history that I would otherwise would not have had.

I-502-001 Losing this great facility would mean a huge deficit in my life, and a great loss to Seattle.
This community center is just the kind of thing that makes Seattle a multi-cultural and unique place.

I understand that construction will go forth with the rail line, but please consider these requests in order to keep our Church and Center available to the community.

- Please keep access to the Latvian center open during construction, at-grade rather than the elevated options
- Please mitigate construction and post construction impacts such as dust, noise and vibration.
- Please do NOT relocate the Latvian Center. Please help us find ways to keep adequate parking and access.
- If it mandatory that that Latvian Center be relocated, please ensure that a fair price is paid and that we are able to relocate to a nearby location of the same size and accessibility

Thank you very much in advance for including these requests in your construction plan.

Sincerely,
Martha Thomas

The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

Short-term visual, air quality, and noise impacts would be avoided and minimized with the implementation of best management practices. These would include fencing the construction area for public safety, spraying the construction area with water to reduce dust, and use of temporary noise walls. For additional information, see Sections 4.5.7, 4.6.7, and 4.7.7, respectively.

Subject: Re: Latvian Church

Hello,

I-503-001 I am requesting that you find an alternate route for your Link, in lieu of destroying what the Latvian Community has built up by a lifetime of hard work and love. Every time that I go to this church/center I feel the love of the many who have built and sustained this community. We Latvians have nothing else and this is HOME. It is not a pile of building materials and dirt. Many of those who helped create this community are no longer with us. World War II unfairly took our country away from us and now this becomes another heartless removal of our new home.

I am 62 yrs. old and want to see the next generation able to carry on our culture. You are dealing with a unique situation that you must look at seriously. This is also our church and one that is not easily replicated. We are in a delicate time of transition for the younger generation and we cannot survive as a viable Latvian home for spiritual, social and cultural connection with your Link replacing, or compromising, our beautiful center.

I came to hear our President speak at the Latvian Center today and I hope his pleas might lend a bit more weight than just our local community. Please understand that, even from afar, we are still Latvians and also Americans. You may contact me for further input anytime.

Sincerely,
Astrida Tralmaks

I-503-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Comments on DEIS

Dear Sound Transit,
I want to make a final comment before the period closes, specifically addressing the City of Shoreline's comments.

I-504-001
1. Contrary to what the city says in its comments, the area around the proposed 145th St station IS ALL single family homes. There is currently no commercial or high-density residential use. Therefore, the 145th station would impact the community just as much as the 155th St station. Having the 155th St station as a community station makes more sense.

I-504-002
2. The residents of the Ridgecrest neighborhood DO NOT want parking garages built at either option. Parking garages will encourage driving. The stations should be community stations and the money planned for parking garages should be used to make bike and pedestrian commuting to the stations optimal.

Sincerely,
Amy Walgamott

I-504-001

Your comment stating your preference for a light rail transit station at NE 155th Street instead of at NE 145th Street is noted.

I-504-002

Your comment about no parking garages is noted. Sound Transit would include pedestrian and bicycle facilities adjacent to stations. Station parking facility sizing and design are balanced with the need for good multimodal connections in order to serve the needs of the region as well as local communities.

Subject: Comments on Lynnwood Light Rail Extension DEIS

Hi, my name is Andy Walgamott, I live at 14802 5th Ave. NE, near the proposed light rail station and very large garage at 145th.

I-505-001 I completely support extending light rail north from Seattle and I would support a smaller station at 145th with appropriate mitigation for the neighborhood. However, I find it difficult to support a station that would also include a 500-car parking garage and redesigned onramp to I-5, both of which may be built diagonal to my home.

Such a large parking garage would be out of scale with our neighborhood of single-family homes and bring about a fundamental shift in the quality of the area. My home would be impacted by noise and light pollution, our view of nice big, slow-growing trees, which also buffer us from I-5, would be impacted, and such a station would bring sharply increased traffic to the area. In one of the proposed configurations, our home somehow is NOT impacted by noise but neighbors on either side of us are. How can that be? I also have very serious doubts that the intersection of 145th and 5th Ave. NE/I-5 can handle the construction of a giant garage shoehorned into a limited space, and afterwards, the subsequently increased traffic load, without major impact to local residents and travelers using 145th to access I-5 or continue west to Aurora and Shoreline Community College.

I-505-002 I do support a station at 130th St. Is it possible to build a multi-story garage there, using the space between I-5 and the golf course, and ***above*** 5th Ave.? I understand that City of Seattle of policies don't allow that, but utilizing that strip of land, while being careful not to impact Thornton Creek, would not impact near the number of residents as one at 145th would. I would support a local station at 155th to better balance the distribution of stations through Shoreline, assuming that Northgate and Lynnwood would be major hubs for riders to embark and detrain. I also support increased bussing to stations from existing park-and-rides.

Thank you,
AW

1

I-505-001
Your comments about the parking garage at NE 145th Street are noted.

The parking garage would be visible from your property. See Section 4.5 for visual impacts and Section 4.7 for noise impacts and mitigation. Chapter 3 discusses traffic impacts and mitigation. The Noise and Vibration Technical Report provides additional information on noise impacts and mitigation at your property.

I-505-002
Your comments about the NE 130th Street Station location are noted. Per City of Seattle plans and policy, parking at a NE 130th Street Station would be either zero or minimal (~100 spaces). Station parking facility sizing and design are balanced with the need for good multimodal connections in order to serve the needs of the region as well as local communities.

Lynnwood City Council Members:
I assure you that if C4 (C3 modified) had been in the original DEIS documentation, everyone who signed our petition against C1 and C2 would still be in favor of the original C3 Alternative (1800 signatures). This modification is too intrusive on the wetlands. And, as you know, these are the highest quality of wetlands within this entire Sound Transit project. C3 is a viable alternative and should be the recommendation given by this Council and be the Preferred Alternative of the Sound Transit Board.

Linda Willemarck

cc: Sound Transit Board

1

I-506-001

Your comment stating your preference for Alternative C3 is noted. Section 4.8 in the Final EIS provides information on ecosystem resource impacts and mitigation for all alternatives.

Subject: Lynnwood Link Comments

I-507-001

When I found out that Sound Transit was considering putting train rails through a protected wetland, watershed, waterfowl refuge, and wildlife habitat, I couldn't believe it was possible for this to happen. There are laws in place to keep this very thing from happening.

Scriber Creek Park and Wetlands are protected under federal regulations, like Section 4f, that states the administration may not approve the use of this property unless there is no feasible and prudent avoidance alternative and that there be sufficient supporting documentation to demonstrate why there is no feasible and prudent avoidance alternative. We all know that there are alternatives in this situation.

The City's own resolution 2012-07 refers to this area as "significant city recreational resources of Scriber Creek and associated wetlands, and the city's Scriber Creek Park, that provide places to experience nature in close proximity to Lynnwood's City Center and regional Interurban Trail, both of which would be negatively impacted.."

The City purchased the Park with Conservation Futures Funds "a fund from property taxes specifically for the purpose of preserving open space, farm land or wooded acreage. "*...to protect, preserve, maintain, improve, restore, limit the future use of, or otherwise conserve land... for public use or enjoyment."* I understand that a Snohomish County Attorney has been asked to check into the use of the funds and the proposed land use implications.

Why is the City of Lynnwood asking for more conservation monies and at the same time they are considering allowing land purchased from those same monies to be unnecessarily, and irreparably altered when there are other sites available.

Linda Willemarck

1

I-507-001

The Lynnwood Link Extension will abide by all applicable federal, state, and local environmental laws and regulations. Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts on environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure no net loss of ecosystem function and acreage as a result of agency projects.

You are correct that there are legal and administrative requirements that would need to be satisfied prior to use of park properties for a light rail facility. These requirements reflect the high value placed on these resources as public benefits. The environmental review process includes these considerations when evaluating the impacts and benefits of potential alternatives. If a Preferred Alternative is selected that includes impacts to Scriber Creek Park and/or the Interurban Trail, all legal and administrative requirements will be met prior to any transfer of properties for light rail use.

Subject: Lynnwood Link - Native Growth Protection Area

I-509-001

There are at least half a dozen different signs posted in the various C Alternatives in Lynnwood. In that the land is quite dense, they can be difficult to find. These lands are to be protected permanently.

A Native Growth Protection Area (NGPA) is a parcel of land, usually wooded, that may have a stream or wetland nearby. Land in NGPAs are protected from human disturbance, alteration and development because of the environmental purposes that this land regularly serves. Often, an NGPA will store water and reduce flooding in nearby areas, help maintain good water quality, and provide valuable rearing and feeding opportunities for local wildlife.

If you live near an NGPA, here are a few things you can do to help protect this valuable environmental resource:
••Refrain from spraying pesticides in or nearby an NGPA as this can harm sensitive plants and animals who live in the area
••Do not dump yard waste or plants into the NGPA as this can smother native plant growth and introduce invasive plant species into a native ecosystem
••Do not remove vegetation, dig or deposit earth, or construct any structure within these areas without prior approval by the City's Public Works Department

1

I-509-001

Thank you for information about Native Growth Protection Areas. Sound Transit will comply with applicable local land use codes.

Subject: Parcel #6411600420 – Seattle Latvian Evangelical Lutheran Church, 11710 3rd Avenue N.E., Seattle

Dear Sir or Madam,

I-511-001 As active members of the Seattle public and Latvian Community, we would like to convey to Sound Transit that plans to expropriate the Seattle Latvian Evangelical Lutheran Church, situated along the planned Lynnwood Link Extension, are wholly unacceptable to our three-generation family as members of the Seattle Latvian Community.

The Seattle Latvian Evangelical Lutheran Church is the center of the Latvian, Lithuanian and Estonian communities in the Pacific Northwest. Acquiring the Church building and/or land to construct the Lynnwood Link Extension is inconsistent with the stated goals of the project to "support the development of Northgate and Lynnwood – the corridor's two designated regional growth centers." Northgate community centers such as the Seattle Latvian Evangelical Lutheran Church support positive community development by providing a meeting center for multiple generations and connect Northgate/Seattle with the wider Baltic ethnic communities around the world.

The Seattle Latvian Evangelical Lutheran Church is a significant center for our family. This Church was built in 1971 with donations from a group of immigrant Latvian families, including our own. Since then, this Church has been a place of worship for our entire family, a meeting place for Latvian community events, a place to mourn our fellow Latvians' who have passed away and a place to teach our youngest Latvians about our culture, language and common history. Indeed, the Seattle Latvian Evangelical Lutheran Church is particularly important for my husband and I as it is the place where we were wed.

In summary, the Latvian Evangelical Lutheran Church is integral to our family's connection with our wider Baltic community. We find Sound Transit's plans to expropriate this land and building as inconsistent with Sound Transit's stated goals of community development when our Church already serves to foster positive community development in the North Seattle area.

Regards,
Anna Grant and Sean Smith

LINWOOD LINK DEIS COMMENTS Att: Lauren Swift
401 Jackson St.
Seattle WA 98104

I-512-001

It is not in doubt that light rail needs to expand and also understood that doing this requires Sound Transit to take private property on the east side of I5. It is fully expected that Sound Transit will do all it can to minimize the loss that will be incurred by those so affected.

In the case of the Latvian Lutheran Church and Cultural Center at 11710 3d Ave. NE this situation is much more than unfortunate – it is tragic. This building was constructed, by hand, over 40 years ago by the Latvian Americans who came here with their families after WWII. They are all now American citizens. It is the center of religious life, of a school teaching Latvian traditions, history and music, a for senior citizens' center. It regularly provides space for over 20 organizations including other Baltic American groups – the Lithuanians and Estonians. The people who weekly use this center come not only from Seattle but from far outside King County. The center periodically hosts important cultural events for people from all over the Northwest, including Canada. There are programs to demonstrate Baltic culture to the larger public.

Many of the oldest generation were actually involved in constructing this building. Their great grandchildren now use it as well. It would be an immense blow to the life of this vital community should the light rail project destroy their Center.

It is expected that Sound Transit will do all it can to allow the Latvian Center to stay. There are some imperatives to ensure its survival:

I-512-002

Access. Since the existing driveway to the church will be taken by the Lynwood extension of the light rail, the agency needs to find an alternate access to the church's property.

I-512-003

Noise. Since the existing buffer trees and wall are to be removed, there will be increased levels of noise and vibration from the rail line. Sound Transit needs to provide adequate methods of noise abatement to allow the Center to continue its programs.

I-512-004

Resources need to be allocated to the Latvian Center community to enable it to find adequate new facilities in the immediate area so that its programs can continue uninterrupted while construction of the Lynwood Link is in progress until such time as they can return home.

Sincerely, Ingrida B Gray Ingrida Bergs Gray
9/15/13

I-512-001

Thank you for describing the history and importance of the Latvian Lutheran Church and Cultural Center to the Latvian community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained.

I-512-002

Access to the property and its functions will be maintained.

I-512-003

Noise walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, any existing WSDOT noise walls removed as part of the project would be replaced. The existing vegetation is not a notable source of noise reduction.

I-512-004

The Latvian Evangelical Lutheran Church and Community Center will not by displaced by the project.

Draft EIS Comments
C/O Lauren Swift
401 S. Jackson St, Seattle, WA 98104

Re: Latvian Church/Center

I have been attending Latvian/Baltic events at the Latvian Church/Center for 20+ years. I travel some distance. These events are important to me.

I-513-001

Therefore I am requesting minimal interference to the Church/Center. These must include:

1) Access
2) Caretaker's house
3) Parking

I suppose a full environmental/justice assessment needs to be done also.

Unlike what we Latvians received from Soviet Russians and Nazi Germans I expect a sense of fair play from you. I grew up without grandparents, aunts uncles, etc. To me who I meet at the Church/Center is my extended family.

Thank you.

Mara A. Johnson

I-513-001

Thank you for describing the importance of the Latvian Church to you. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

The caretaker's house would be displaced but Sound Transit would help with its relocation as described in Section 4.1 of the EIS. An environmental justice analysis was done for this project. It is located in the Final EIS Section 4.4 and Appendix C.

I-515-001

I have reviewed a portion of the DEIS and find my primary issue is that the Latvian Church + Center will be compromised. My family has had the benefit of the center for the 30+ years we have lived in Seattle. It represents the victory over unbelievable hardships endured by the Baltic peoples that was partially accomplished by their rights of US Citizens. My children were Baptized there, attended 10 years of culture + language classes, made friends for a lifetime. My eldest daughter, living in CA, chose to be married at the Latvian Church as it is "home" to her. Please consider the strength the center gives us all. Thank you, Mary Pelekis

I-516-001

Although I fully support Sound Transit's Lynnwood Link Extension because I recognize the need for comprehensive mass transit in the region, I am concerned about the proposed loss of the Seattle Latvian Church & Center in Northgate. My father is Latvian and my sister and I spent our childhoods embracing our culture at the Latvian center while attending weekend cultural school. The Latvian Center is extremely important to the Baltic community in the Pacific Northwest and serves as the nexus which preserves our culture and community. I understand that many comprimises will have to be made in developing the light rail, but please consider the implications of destroying the Seattle Latvian Church & Center.

For the past 35 years, from the time our family moved to the Northwest, we have been attending Lithuanian-American Community events in the Latvian Center in Northgate. The Latvian Center has become very important to the Lithuanian Community over the years. I am the founder and director of the Lietutis Lithuanian Folk Dance Group which on many occasions has used Latvian Hall for its practices. One of many highlights includes the Northwest Baltic "Tap 'n Clap," a workshop which was hosted in 1983 and 1985 and which brought together Lithuanian, Latvian, Estonian and Finnish dance groups from Portland, Seattle and Vancouver into a fantastic evening of sharing. I served on the Board of the Washington State Lithuanian-American Community from the mid '80's to 2006. During my tenure on the Board we had many occasions to gather in Latvian Hall. In particular I remember the huge celebration on March 11, 1990, when Lithuania re-established its independence from the Soviet Union. We met with the press and representatives from Congress as we celebrated. I remember being interviewed by Chris Legeros of KIRO-TV in 1991 for reaction to the first President Bush dragging his tail on recognizing Lithuania as a sovereign nation. We chose Latvian Hall for that interview because it was a friendly, welcoming and central meeting location for all Baltic groups, not just the Latvians. I remember the many(and ongoing) University of Washington Baltic Studies Fundraisers held in Latvian Hall through the joint efforts of the local Estonian, Lithuanian and Latvian communities in collaboration with the University of Washington. I remember the memorials for deceased Lithuanian Community members, and the wedding celebrations for newlyweds; I remember landmark birthday parties – all at Latvian Hall. It would be extremely painful for the Lithuanian Community to experience the loss of Latvian Hall in Northgate. It has become and continues to be the ethnic, cultural, educational and social hub for so many groups. As you seek to resolve rapid transit challenges, please take into account the multitude of ways you are severely impacting the many ethnic groups served by the Latvian Center. To us, it has great emotional significance and immense practical value. Please stick to the at-grade option that appears to offer the least amount of disruption to the facility and its functions. Note that even that interference will be substantial. Thank you for your consideration of the communities which your decisions are impacting.

Zita E. Petkus

Thank you for describing the importance of the Latvian Center to the Lithuanian-American community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

I-518-001

We wish to add two more voices of opposition regarding the Lynnwood Link Extension. Historically the Latvian people have been forced to relocate many, many times because of "supposedly" the benefit of the many. Now it appears they will be "displaced" AGAIN in a free society. This Latvian Church and Community Center benefits thousands of people, not just a few. The plan to move ahead with this Rail Link project seems to be in total disregard of what these people contribute to the American society. I wonder if these Latvians were of a different ethnic group and scream the message of "discrimination" they just might have more clout. We desperately and respectfully ask that the DEIS consider other possibilities as to where the rail link could be located. There simply HAS to be another solution. Is 5th Ave. being considered? Also there seems to be ample space on either side of I-5 at freeway level. Has that been reviewed? Would a cross-over elevated track to the West side of the freeway be out of the question? The current plan whether at grade or elevated level would be an absolute travesty to thousands of people who participate in the multitude of activities provided by this Latvian Center. As one person said, "This is not just a church and community building but a monument".

Sincerely, Tex Wilson Ausma Wilson

I-519-001 My husband and I moved to Seattle in 1965 due to a job transfer but the move was also enhanced by the large Latvian community here. We sent our children to Latvian School and took part in many activities at the Center. When the Latvian Center lost their "home" to the Wallingford Playfield, it was a huge disruption for our family. Now for over 40 years the present site had been the home for Latv. Evangelical Lutheran Church and Center, not just for the Latvians but for the Estonians and Lithuanian communities as well. I can't believe that for the 2nd time you want to destroy our "home."

Many elderly and retired Latvians have bought homes close to the Center so they can either walk or drive a very short distance to church services and the many activities there. What will become of them?!!

This is not the way to treat people and just not acceptable!

Draft EIS comment for the Lynnwood Light Rail
September 23, 2013

To Sound Transit,

This is in regards to the DEIS for the Lynnwood Light Rail.

I-520-001 I voted for the light rail to come north, but I expected it to follow the freeway Interstate-5 into the Lynnwood Transit Station not come into our neighborhood. I completely support the C3 alternative route option especially the C3M which follows the Interstate-5 freeway in the center of the south and north bound lanes. I am against the C1 and C2 options because of the intrusive and destructive path it takes into our quiet, vulnerable neighborhood. The C4 option the City of Lynnwood has recently proposed does nothing to convince me is the right option because I have not seen any data or a written proposal from Sound Transit that accepts the C4 as even being considered an option. The photos of C4 show the Light Rail destroying more wetland and displacing several more businesses than the C3 option.

I-520-002 While reading the DEIS I found numerous inconsistencies, calculation errors, failure to include and assumptions made about our neighborhood, especially West of 52nd/Cedar Valley Rd. This leaves me concerned that not enough detailed attention was put into a large scale Federal Government project as the Light Rail. I expect with so much money going into this project that the DEIS would be professionally and accurately handled with less errors. This study is embarrassing for such a large scale company as Sound Transit. I really expected more.

List of Errors in DEIS:

I-520-003 Technical Report Noise and Vibration, Part 7, Attachment D (Vibration Impacts by Build Alternative), Page D-54. The distance to nearest track (ft) is incorrect on C2M and C3M and C2W and C3W. Living at 5214 201st PL SW I can assure you that I live closer to the C2M and C2W than the C3M and C3M. It appears that all the C2 and C3 numbers have been switched and not just for our house but everyone on our block as well as others on nearby streets. It makes me wonder if the numbers are even correct in footage or did you just eye it.

It was stated at meetings that no noise or vibration monitors were even put near Cedar Valley Road or our part of the neighborhood across from where C1 would travel. How do you even know what noise levels are now in our part of the neighborhood. It sounds like an assumption was made based off the noise monitor put by the Park-n-Ride Transit Station. We felt excluded and left out of the survey. Sound Transit rarely mentions the neighborhood west of 52nd/Cedar Valley Rd. The DEIS just states that the neighborhood would have a negative visual and aesthetic impact as well as noise that mitigation would be used and other features used for the visual impact. I really don't

I-520-001
Your comment stating your support for the Lynnwood Link Extension project and your preference for Alternative C3 is noted. The Preferred Alternative in Segment C is a modified Alternative C3.

I-520-002
It is Sound Transit's goal to produce environmental documents that contain accurate environmental information with the purpose to help decision-makers make decisions. The purpose of the Draft EIS public comment period is to provide the opportunity for members of the public to point out things that they believe should be included. Sound Transit has received good feedback from agencies and the public, and has used the relevant comments to improve the document.

I-520-003
A labeling error occurred which resulted in a portion of Alternative C2 to be switched with a portion of Alternative C3 during the vibration analysis (from Civil Station 522+00 to the north end of the alignment). This error had no effect on the conclusion that vibration mitigation was not required for receivers along that segment of the alignment. The correct distances are used for all receivers in the Final EIS and the correct vibration levels are reported.

As shown in Final EIS Figure 4.7-4b, noise monitoring site M-51 was near the corner of 200th Street SW and Cedar Valley Road, site M-49 on 52nd Avenue W between 204th and 206th Streets SW, and site M-48 on 52nd Avenue W between 206th and 208th Streets SW. These measurements were used to characterize existing sound levels in the Cedar Valley Road and 52nd Avenue W neighborhood. The noise analysis included modeling of residences in the neighborhood, as shown in Figure 4.7-5d of the Final EIS. Impacts to the neighborhood were considered at the same level of detail as impacts to other neighborhoods adjacent to the potential project alignments.

I-520-004

know how your going to block a 40ft plus structure that looks down on a neighborhood. Trees will not work because they have to be 30ft from structure so I guess Sound Transit will have to plant large trees on 52nd street or just a large wall for all the gangs to put graffiti on.

The DEIS states the the C1 and C2 alternative routes are cohesive to the neighborhood. That is so laughable and is such an assumption. If Sound Transit looks at the corner of 200th and 52nd/Cedar Valley Rd. they would see that it is cohesive and in harmony with nature right now. The Cedar Valley Business Building and Sprague"s Ponds and park are across the street from the C1option that takes out the Scriber Creek Park and Cedar Creek Condominiums. If C1 is selected, the harmony, flow, and unity of the blending of the East and West of 52nd/Cedar Valley Rd. will no longer be. It will be a visual and aesthetic disaster.

I-520-005

I did not read anything about Crime. How will it affect the surrounding communities and neighborhoods around the structures(pillars) and the Sound Transit Stations? At Sound Transit meetings all that could be said was that it would increase crime in our neighborhoods. I am not happy about this and hope Sound Transit works with the local Lynnwood Police Department on the possible increase of crime in our neighborhood.

I-520-006

I really think Sound Transit needs to let go of the C1 and C2 options because the City of Lynnwood has a great park and wetland that is a very unique and beautiful sanctuary for wild habitat and people. The Trees are large and old and are a natural barrier and buffer for our neighborhood from the Park-n-Ride Transit Station. The wetlands and bogs clean and filter the pollution from the city, cars, buses and people. Nature can be calming to commuters driving, walking, biking or railing in to a city. C3 is far enough away to not hurt the surrounding neighborhoods and the wetlands, but close enough that the people on the Light Rail can see the beauty of the ponds,trees,wetlands, and animals that is a part of Lynnwood.

Choose C3M.

Tricia Monaghan
5214 201st PL. S.W.
Lynnwood, WA 98036
(425) 778-3242

I-520-004

The Draft EIS analysis is generally consistent with your characterization of high visual impacts in the 52nd Street vicinity with Alternatives C1 and C2. The extent to which visual impacts affect neighborhood cohesion is related to a wider range of issues than the visual appearance. The Draft EIS on page 4-59 states that Alternatives C1 and C2 would travel along the eastern boundary of the South Lynnwood and Hazelwood neighborhoods and would change views but not change the character and cohesion of the neighborhoods. The aesthetic analysis on page 4-81 states that the elevated guideway in Alternatives C1 and C2 would visually intrude upon the integrity and unity of the residential neighborhood on the opposite side of the street and is rated as a high visual impact. As indicated in the analysis, the visual impacts at the periphery of the neighborhood would not be expected to affect neighborhood, cohesion which relates to well-defined neighborhood boundaries, transportation connections, stable land use, and opportunities for local interaction. See Section 4.5 of the Final EIS for more detail about visual impacts of the project and mitigation.

I-520-005

Section 4.14 of the EIS discusses crime. Crime is not expected to increase as a result of operation of the stations. Several studies have concluded that crime around stations mirrors crime rates in the surrounding neighborhoods. Most areas in the project corridor have low crime rates. The stations would be well lit, continually monitored by security cameras, and regularly monitored by security personnel.

The project's final design will incorporate Crime Prevention Through Environmental Design principles, which will consider structures and pillars.

I-520-006

Your opposition to Alternatives C1 and C2 and your preference for

Alternative C3 are noted. A modified Alternative C3 is evaluated as the Preferred Alternative in the Final EIS.

To: Lynnwood Link DEIS
Subject: comment on Sound Transit Lynnwood Link
Attachments: Light Rail Chicago.jpg

I-522-001 Sorry to have missed the meeting this morning. I think Alternative C3 is the best alternative. This design is consistent with the objective of the Lynnwood Station: a stop on the way to parts North.

The line should not transit up 52nd Ave W, as would occur with the C1 and C2 alternatives. C1 and C2 trap valuable acreage between the train line and I5. This trapped acreage would only be useful if the Lynnwood stop were an end of the rail line. And no one living in Lynnwood wants a train yard here (see attached).

I-522-002 At the previous meeting in Lynnwood it was explained that the expected increase in citizen traffic into the new Lynnwood Station would be 20,000 people per day and provide 1,900 parking spaces. This parking is only an increase of 500 above the current parking, which is always totally full. The C1, C2, and C3 options would all be grossly deficient in parking space for this increase.

I-522-003 Finally, Lynnwood roads in this area also poorly support the accompanying increase in local traffic: they include school zones, residential areas, and 2 lane roads. The expected 10-fold increase in transit will tie these roads in knots at the height of rush hour.

Cheers,
Karin Everett

1

I-522-001
Your comment stating your preference for Alternative C3 is noted.

Your comment about the train yard is noted, but the Sound Transit Operations and Maintenance Satellite Facility is a separate project.

I-522-002
The projected 20,000 rail boardings are not expected to arrive all in the form of cars. The majority of those riders are expected to arrive by bus, as well as by bicycle and on foot. Station parking facility sizing and design is balanced with the need for good multi-modal connections in order to serve the needs of the region as well as local communities.

I-522-003
A traffic analysis was performed for the Lynnwood station area taking into account the additional 500 parking spaces that are provided at the station as part of the project. Sound transit will work with the City of Lynnwood to provide mitigation for any traffic impacts caused by the project.

I-523-001

I live in the Cambridge Apartments, on 200th St. SW between 48th Ave. W and 46th Ave. W, really close to Lynnwood Transit Center.

I appreciate that, so far, everything is planned to stay south of 200th St. SW, including option C1, which puts the Link Station on the south side of 200th St. SW, directly across the street from Cambridge Apartments.

I think its very possible I will live in Cambridge Apartments for a very long time. I do not want any project to take away any part of Cambridge Apartments. This project should not destroy any housing, and I appreciate that option C1 goes directly across the street, but does not remove any part of Cambridge Apartments.

Thank you for your time. --- David L. Harbaugh

I-523-001

Your comments regarding property impacts and keeping the project south of 200th Street SW are noted.

Subject: question reqarding 1st Ave N & 117th St

Hello,

I-524-001 Apologies for not being able to make it to any of the public open houses for the Lynnwood Link. I have a question regarding the segment between Northgate Transit Center and 130th. The DEIS says that 1st Ave N will need to be altered at the junction with 117th, but it doesn't say exactly how it will be altered. I live near that intersection, and how that part is built is important to me. Can you please provide some insight into the plans for how that location will be affected by the plan?

I-524-002 Secondly, I would like to show support for the option with a Link stop at 130th and I-5 junction. Who do I convey my support to?

Thank you for your attention.

Kind regards,

Joanne Ho

blog: www.powerhouse360.com

I-524-001

None of the alternatives evaluated in the Final EIS would require realignment of First Avenue NE at NE 117th Street. First Avenue NE would be realigned farther north in sections around NE 160th Street. The NE 117th Street overpass would be reconstructed with Alternative A1. See Appendix F of the Final EIS for the project's conceptual designs.

I-524-002

Your preference for a light rail transit station at NE 130th Street is noted. By submitting your comment letter on the Draft EIS, your comment was given to Sound Transit for consideration in identifying a Preferred Alternative in the refinement of the Segment A alternatives evaluated in the Final EIS.

To: Lynnwood Link DEIS
Subject: Save Latvian Community Center

I-525-001

I am writing to express my concern about the possible impact of the Sound Transit Lynnwood Link Extension on the Latvian Lutheran Church and Community Center in North Seattle. The Draft Environmental Impact Statement for this project fails to recognize the importance of this facility to all of the Baltic communities in the Pacific Northwest. The Latvian Center is not merely a church used for a few hours each Sunday. It is the hub of social and cultural activities for Latvians, Lithuanians, and Estonians throughout the region. It is used throughout the week for a variety of cultural, educational, social, and religious events. Any negative impacts on the Center's ability to function will have serious ramifications for thousands of families who depend on it to maintain ties with their heritage.

As a Lithuanian-American, I have been involved in Lithuanian and other Baltic community activities since 1984 and thus have spent countless hours at the Latvian Center attending cultural celebrations, social events, dance practices as both teacher and participant, weddings, and funerals. Because my own family lives on the other side of the country, the Lithuanian community here is my extended family. Participating in activities at the Latvian Center has provided me with the ability to pass on my culture to the next generation. My son, who is now 22 years old, literally grew up at the Center, having attended his first celebration of Lithuanian independence when he was less than 2 months old. He went on to become a member of the Lithuanian dance groups Lankas and Linas and as such participated in Lithuanian dance festivals in Chicago that drew dance groups from literally all over the world. He developed strong relationships with other Lithuanian-American children that last to this day, and his appreciation of our culture would not have been possible without these relationships and a place to form them. His involvement with the Lithuanian community growing up laid the foundation for his interest in and appreciation of all world cultures. In fact, he graduated from college this year with a bachelor's degree in International Studies.

Our Lithuanian community ties have been cemented by having the Latvian Center available to us. Being a relatively small community in the Northwest, we Lithuanians do not have the resources to build our own Center and have depended on our Latvian friends' generosity in allowing us to use theirs. Closing the Latvian Center would have a devastating effect on our ability to flourish as a viable cultural entity.

While I recognize the importance of extending light rail to the north suburbs, I urge you to engineer the project in ways that will have minimal impact on the Latvian Center. All of the involved communities need to maintain constant and consistent access to the Center throughout the construction period. In addition, the Latvian Center needs to be able to function normally as it has for more than 4 decades in its present location after construction is finished and the light rail system is in operation.

1

I-525-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you and the Baltic community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained.

In these days when American culture becomes ever more homogenized by consumer-based corporate influences, government should do everything possible to promote cultural diversity. Everyone who lives in the Puget Sound region benefits from its cultural richness directly or indirectly. Please allow our Baltic communities to continue to thrive by reducing negative impacts on the Latvian Center in whatever ways possible. Thank you for your attention.

Sound Transit

Draft EIS Comments

c/o Lauren Swift

I-526-001

I would like to take the opportunity to comment to Sound Transit on your Lynnwood Link Draft Environmental Impact Statement (DEIS). I think, with all of the testimony at your Open House meetings, as well as comment letters from individuals and organizations associated with the Seattle Latvian Church and Community Center, at 11710 3rd Avenue NE, you are beginning to understand the importance and uniqueness of this facility in the Pacific Northwest.

I was born in Seattle and christened in the previous church facility on Densmore Avenue, but moved away before that facility was taken by the City of Seattle. When I returned to Seattle in 1975, I spent many happy years dancing folk dances with Trejdeksnitis in the hall. I also married my wife and christened and confirmed both our sons in the current church, so the facility has very deep ethnic and religious meaning to me. Our sons also attended Latvian school and danced with the folk dance group and are still active in Latvian activities and speak the language. Without this facility built by our parents, none of us would have had a chance to learn our ancestor's language, history and culture.

I am now able to give back to this community by taking several leadership roles, as vice president of the board of the Latvian Evangelical Lutheran Congregation of Seattle, past secretary/treasurer of the folk dance group Trejdeksnitis, past administrative director of the 1992 West Coast Latvian Song Festival organizing committee's folk dance performances, and secretary of the State of Washington chapter of fraternity Lettonia. This is the second, and in some cases third, generation of Latvian-Americans who now lead the community organizations – all made possible by the hard work of parents and grandparents who arrived in Washington from the Displaced Persons camps of Europe, often with little more than the clothes on their backs, their education and tenacious spirit.

The activities provided for youth at the Center have kept them busy and out of trouble, and established life-long friendships. It has also allowed them to travel to Latvia, most recently to perform in the 2013 Latvian Song and Dance Festival, with the capability to speak the language and understand the culture. The multi-generational nature of our community is difficult to find elsewhere in American culture.

1

I-526-001

Thank you for describing the importance of the Latvian Church to you and the Baltic community. Subject: Draft EIS Comment Regarding Impact on Latvian Lutheran Church and Community Center

I-527-001

As an American-born woman, married to a second-generation Latvian, I have been blessed to share in the rich religious and cultural activities of Seattle's Latvian Lutheran Church and Community Center. My husband and I were married over 36 years ago in the Latvian Church. Our two children, Peter and Lara, were baptized in the church and both attended and graduated from Seattle's Latvian School, housed in the community center. Lara was confirmed in the Latvian Church at the age of sixteen, and Peter and his fiancée, Lauren, will be married in the Latvian Church next summer.

As my interest in Latvian culture has grown over the many years, I have learned to cook a variety of Latvian dishes and now coordinate and teach Latvian cooking classes at the Latvian community center. To further enhance my involvement in Latvian activities, I participated for several years in a Latvian language class, tailored for non-Latvian speaking adults. To this day, I frequently contribute to, participate in and enjoy the many activities offered at our church and community center.

Clearly, I embrace what Seattle's Latvian Lutheran Church and Community Center offer to me personally, to my family, and to the Seattle Latvian community as a whole.

Sound Transit's Draft EIS, which discusses extension of the Link Light Rail System from Northgate to Lynnwood, troubles me deeply, as I understand the alignment of it will possibly severely limit or even eliminate our access to our church and center, putting ongoing existence of our community at great risk.

I urge the Sound Transit Board to recognize the intrinsic value of our church and center to the Latvian community on the west coast of the United States and Canada and maintain it at its present location.

Subject: Draft EIS Comment - Latvian Church and Community Center

To whom it may concern,

I-528-001

I am currently an international graduate student at the University of Edmonton in Alberta, Canada. I've recently learned from both my family as well as longtime Latvian friends in Seattle of Sound Transit's Draft EIS which discusses extension of the Link Light Rail System from Northgate to Lynnwood, passing in close proximity to or possibly even directly through the property on which Seattle's Latvian Lutheran Church and Community Center are located. I find this information unbelievable and impossible to comprehend.

For my entire life, I've been closely tied to the church and community center. I was born in Seattle in 1990 and was baptized at the Latvian Lutheran Church. From the age of five to thirteen I attended and graduated from Seattle's Latvian Saturday School. As a high school student, I danced with Seattle's Latvian dance group, Trejdeksnitis. I was confirmed in the Latvian Church at the age of sixteen.

I attended undergraduate college out of state and am now attending graduate school out of country, however I return to Seattle frequently for visits with my family and friends and routinely participate in religious and social events at the Latvian Church and Community Center while I am in town.

Clearly, Seattle's Latvian Church and Community Center have been and continue to be an integral part of my life. Any light rail plans that would either limit or eliminate use of the Latvian church and community center would have a profound effect on me personally, not to mention the Latvian community throughout the entire West coast of the United States and Canada.

I urge the Sound Transit Board to consider the unique nature of our church and community center and maintain it at its present location.

Regards,

Lara Kristine Sreibers

lsreibers@gmail.com

Thank you for describing the cultural importance of the Latvian Evangelical Lutheran Church to you, the region's Latvian community, and the larger Baltic community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: DEIS Commentary for Lynnwood Link Rail Extension

Greetings,

My name is Frank Massaro of 19522 5th Avenue NE, in Shoreline. I am writing to offer my commentary on the DEIS for the proposed Lynnwood Link Extension proposed by Sound Transit.

I-529-001 **It is my opinion that Option 1, with tracks at grade, a center platform, and a 500 car parking structure located on the west side of I-5 should be the preferred solution chosen as the project moves forward. I feel that this alternative provides the greatest opportunities for our community; both in terms of providing a design for the station that is compatible with our existing neighborhoods, but also one that provides potential for a productive future of the station area.**

I-529-002 **I would also like to indicate that I feel that traffic control devices, namely a traffic signal should be installed at 5th Ave NE and NE 185th Street. This is a confusing and somewhat dangerous intersection given the discontinuity of 5th Ave NE at NE 185th Street.**

I-529-003 **Similarly, I feel that sidewalks and traffic calming devices will be required in the station area – namely along 5th Avenue NE between NE 185th and 205th Streets. These elements have not been shown in any design alternatives. The impacts will be similar regardless of which alternative design is chosen. These impacts should not be carried on the backs of neighborhood residents and should be planned for in the design of the 185th Street station, and provided by Sound Transit. Most simply put, I am not interested in having a property assessment to install a sidewalk or similar feature on my street as a result of Sound Transit's impact on my street and neighborhood.**

I-529-004 **As a member of the 185th Street Station Citizen's Committee, I have been involved in a number of outreach activities that have made contact with a good number of our fellow neighbors. I believe that the preference I have stated above closely echoes that of many fellow area residents, and as a result, the 185th Street Station Committee.**

I am hopeful that the comments submitted both by me and others with respect to our preference for the station design will not be ignored, and that a station that is respectful to the wishes of residents of the affected communities will be the result. I also feel that it needs to be stated that we, who live in the area immediately impacted by this project, are the ones who will continue to make our lives in the area once the project is completed.

Please feel free to contact me at my e-mail address, or by phone at (206) 219-3628.

Sincerely,

Frank Massaro

Shoreline WA

1

I-529-001

Thank you for your comment stating your preference for the Option 1 layout of the proposed light rail transit station at NE 185th Street with the parking garage on the west side of I-5.

I-529-002

Traffic analysis conducted for the EIS indicates the intersection functions at an acceptable level of service as a stop-controlled intersection. At this location, the Preferred Alternative would realign 5th Avenue NE to better integrate with the I-5 off-ramp and the intersection with NE 185th Street.

I-529-003

The extent of traffic calming designed with the project will be further evaluated during final design. Sound Transit will provide sidewalks for pedestrian access to the station, where they are determined to be necessary due to the project.

I-529-004

Thank you for your comment indicating the proposed Option 1 light rail transit station at NE 185th Street appears to be supported by many with whom you have spoken to in your neighborhood. Your comments, and others submitted to Sound Transit through the community outreach program and during the comment period for the Draft EIS, will be considered by Sound Transit in making their final decision for the Preferred Alternative.

Elaine,

Great talking with you. Please let me know when there will be an on-site visit to the Scriber Creek Park area and I will be there with a few others who know the area well.

I am out of town until September 11, but wanted you to have some information that I've uncovered regarding the Lynnwood Link. It has been very unsettling to find so many discrepancies. The more questions I try to get answered, the more questions I have. Hope this research is helpful for you.

I-530-001

City of Lynnwood, 20015 Cedar Valley Road, "Scriber Creek Park", Neighborhood Park / Open Space – 3.8 acres.
However, Snohomish County Assessor, Parcel 00608400300101, 20015 Cedar Valley Road, City of Lynnwood, 761 parks – general recreation, 4.59 acres.
In addition, this parcel is listed as "City of Lynnwood Scriber Creek Wetlands Park" in Backflow Prevention along Scriber Creek Attachment A-1, Scope of Work., 6/28/11.

Page 4-27 Segment C: Mountlake Terrace to Lynnwood. Alternative C1 – 50 Full Acquisitions
However, Table 4.1-1 Potential property acquisition and displacement C1 total full acquisitions – 80

Table 4.2-2 Estimated area of acreage by land use. C1 multifamily lists .83 acres.
However, The 76 Multifamily units are over 3.0 acres alone.

Table 4.17-5 Potential Construction Impacts on Scriber Creek Park. "Short-term partial closure of the park during construction." *THIS IS THE ONLY NOTATION.*
However, the C2 and C3 categories note noise and visual impacts, *yet not in C1.*

Table 4.8-1 Streams in study area, Coho Salmon and Cutthroat Trout noted. See figure 3.1c in the DEIS.
OMSF Site Evaluation October 2012, City of Lynnwood: The City was also concerned about the sites proximity and potential impacts to the Interurban Trail (linear park on the south side) and Scriber Creek (salmonid bearing waterway north of the site) and potential loss of flood storage capacity.
However, (Summary) S-20 No adverse impacts on threatened or endangered species. ...in seismically active area therefore, localized geological hazards and risks are possible.

City of Lynnwood, Chapter 17.10, Environmentally Critical Areas: 17.10.060 Stream – Rating.
A. Category I. The following streams are classified as **Category I: Scriber Creek**, Swamp Creek, Lunds Creek and Halls Creek. The Sensitive Areas Ordinance requires buffers from the nearest development.
However, 17.10.062 Stream alteration allowed.
A. All Category I streams shall be preserved. The city may only allow alteration of Category I streams when approved under LMC 17.10.048 and 17.10.049.
A. An application for a reasonable use exception containing the elements required in LMC 17.10.049 shall be filed with the department and shall be considered by the hearing examiner at a public hearing under Process I (LMC 1.35.100 through 1.35.180).

S-20 Water resources – the Segment C alternatives could place structures in the Scriber Creek Floodplain.
However, S-31 C1 would have columns and a section of the elevated guideway within the Park

I-530-001

These comments were submitted by Linda Willemark previously. See response to comment I-386.

I-530-001

Native Growth Protection Area. Sign Installation Guidelines Sign placement shall be up to the approval of Snohomish County. All signs must be secure and permanent.
However, there are at least 7 signs which our group has found on the C Alternatives property. One sign is only 50 feet away from 52nd Ave W. With the dense wooded area it is difficult to note with any accuracy how many more signs there actually are.

Table 4.1-1 Property acquisition list includes Multifamily use.
However, Table 4.1-3 Property available for relocation has NO Multifamily listed

Figure 4.17-4 Scriber Creek Park Potential Impacts with Alternatives C1 and C2.
However, Scriber Lake Creek is labeled where Scriber Creek is.

Page 1-4 1.3.1 – Aquatic Species and Habitat, 1.3.2 – Vegetation, Terrestrial Wildlife and Wildlife Habitat and, 1.3.3 – Wetlands. *They talk about looking at impacts 100-200 feet outside the direct project area. Sprague's Ponds are across the street from Scriber Creek Park and I've read no mention on the impacts the Light Rail would have on that waterfowl and wildlife area.*

1.4.3– Avoiding and Minimizing Impacts on Sensitive Ecosystem Resources. *If Sound Transit's first priority is to avoid impacts to sensitive areas, then why are they building on a wetland, watershed, and wildlife habitat?*

To Sound Transit and the Counsel,

I-532-001 I understand Shoreline voters voted in light rail sometime back, although I don't recall when exactly this occurred. Now that Shoreline is in the planning stage, they have had meetings and asked for comments regarding their various plans. They no doubt are doing this as a courtesy so that Shoreline's residents feel they are a part of the decision making process. However, I question if consideration is being given to these comments, as it appears Shoreline has for the most part made up their mind on many aspects already. I feel that those decisions made by counsel members should have been voted on by we the citizens. I feel that until the rail is built and it is determined what the actual usage is, we should not be building new stations and garages, but use the stations and garages currently used by the bus systems. Oregon and other areas with light rail experienced much less usage than what was projected.

I-532-002 I do not feel a station should be built at 185th. That would make the stops too close together. The existing garage near Ballinger along with the current 145th station should be sufficient. We should use what we have and not waste money. Usage is a big "IF" at this time. Also, residents on the east side of the freeway should not be uprooted or exposed to all the noise a train would bring. This is very unfair to those living in that area. Put yourself in their shoes. I wonder how you counsel members would feel if you lived in the area affected by these changes. Shoreline needs to slow down and stop spending. The Federal government is broke and cities and states should limit the amount they are requesting and getting.

I-532-003 In the end, we the people are the ones who end up paying for it with higher taxes etc. I challenge you the counsel members to take a more conservative approach. When all is said and done, you will be responsible for spending our money and not considering what we the people want. You need to put these prospective issues to a vote and not decide for yourselves what we the people need. That is not a democracy. We should want Shoreline to be a different type of city-a city that involves all of its citizens and not dictatorial like the government is becoming.

Thanks for reading this letter. A concerned Shoreline resident,

Sherri Andersen

I-532-001

Your comments are noted.

I-532-002

Considerable analysis was conducted to determine the number, location, and amenities to be located at each of the proposed light rail transit stations prior to the selection of the alternatives for evaluation in the Draft EIS. Rather than distance between proposed stations, the more important factors are the forecasted number of residences (single family, apartments, or condominiums) and forecasted number of jobs within proximity of the station site. Peak use of the light rail system is primarily determined by commuters leaving homes and traveling to jobs in the peak morning and late afternoon periods. Please see the *Alternatives Analysis Report* in Appendix K for more detailed information.

The project will be selected and constructed by Sound Transit, partially with FTA funding, not the City of Shoreline.

I-532-003

Your comments and concerns are noted. However, Sound Transit is not involved in the governance of the city of Shoreline.

Don't depend on Federal Grants. The Federal Gov. is Broke. Don't put their debts on the backs of the younger generations.
Go slowly Stop the train at Northgate & pay it off! If voters could vote now they would not vote for the train.

Is anyone listening to the people? So many people are unhappy with Sound transit.

SOUNDTRANSIT RIDE THE WAVE

I-533-001

The Lynnwood Link Extension is part of the Sound Transit 2 system expansion that voters approved in 2008. Sound Transit's financial plan has assumed that the agency would secure some federal funding for this project; therefore, Sound Transit plans to pursue a grant through the Federal Transit Administration's New Starts program.

I RECENTLY BOUGHT A HOUSE ON 52ND AVE W. NEAR THE CORNER OF 204TH. I AM OPPOSED TO THE PROPOSED C1 & C2 ROUTE FOR MANY REASONS OTHER THAN IT BEING THE FIRST THING I SEE EVERYTIME I STEP OUT MY DOOR ALONG WITH THE HORRIBLE NOISE. I AM ALL FOR PUBLIC TRANSPORTATION - I TAKE COMMUNITY TRANSIT #511 TO WORK AND BACK FIVE DAYS A WEEK AND I KNOW THE CONTINUATION & CONSTRUCTION OF THE LIGHT RAIL IS INEVITABLE, I FEEL THE PROPOSED C3 ROUTE WOULD HAVE THE LEAST IMPACT TO THE FAMILIES, HOMES, AND LIVELIHOODS IN THE COMMUNITY. THIS IN SHORT REFLECTS WHY I AM OPPOSED TO THE DEMOLITION OF THE BUILDING EITHER THE C1 OR C2 ROUTE. PLEASE FOCUS ON THE C3 OPTION

THANK YOU.

Hello,

I-537-001

I have had the pleasure of being part of the Seattle Latvian community for over 20 years. It has been an honor to share with this rich, vibrant community weddings, funerals, celebrations, and times of grieving - all centered around the Seattle Latvian Center.

It seems to me a cruel irony to disrupt and displace this community from their spiritual center, when their original members came here, largely, because they were disrupted and displaced from their homeland.

Sincerely,

SOUNDTRANSIT

RIDE THE W

I-537-001

Thank you for your comments about the Latvian Center. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Attachments: Latviesu nams - Diana Chism.docx

First, I would like to thank you for providing multiple forums for feedback, as I attended many of the townhall meetings for the Lynnwood to Northgate extension, but was not comfortable standing up to present my thoughts. I do support light rail and mass transit in general, and am very excited to see Seattle moving forward in this direction.

Attached is my formal letter with thoughts and feedback! Please let me know that you have received and are able to read the attached Word document.

Thank you!

-Diana

I-539-001

Fulfilling a dream!

The future of the Latvian Evangelical Lutheran Church and Center (Latvian Center), located at 11710 3rd Ave N.E. Seattle, WA is currently being threatened by Sound Transit's plan to run a light rail line from Northgate to Lynnwood. While the collective Latvian Church and Latvian Association of Washington State boards continue to work on our joint formal response to the Sound Transit DEIS (Draft Environmental Impact Study), I wanted to respond from my personal experiences with our Latvian Center.

I was lucky enough to still have a Grandmother into adulthood and to be able to hear her stories about Latvia, as she lived a very long life into her 90's. She spoke of the hardships leaving her country to go "somewhere safe" – traveling with three small children and pregnant. Leaving with only what they could carry, they escaped Communist rule and first fled to a Displaced Person Camps in Germany. After several years there, they finally ended up in Washington State, sponsored by a Lutheran Church that gave their pledge that the Latvians arriving would be hard working, trustworthy, respectful, law abiding citizens of their new country. My mother was 9 years old when she first came to America, my father a little older as he first spent time in England. They have fulfilled their promise of being exemplary citizens of very high character and integrity.

Growing up in a Latvian family was unique. I knew I was different from my friends. I spoke a different language from birth, had activities outside of school that my friends didn't understand, I couldn't always participate in weekend events because I had to attend Latvian school. It was as if I lived two separate lives, with different sets of friends and activities. Some weeks I would travel from Lynnwood to Northgate (with my family) to functions five (or more) days out of seven days of the week. Choir practice, folk dancing, confirmation studies, Latvian School (where we learned Latvia's geography, Latvian grammar, history of Latvia, religion, Latvian literature – ALL in our native Latvian tongue), and then special performances from various Latvian groups traveling to Seattle from Australia, Latvia, Sweden, England, Germany – all parts of the world. It was a very, very rich life that has helped me better understand other cultures and ethnic diversity. I still remain very active in our Latvian Society and am often at the Latvian Center - attending church services /funerals/christening/confirmations, performing with singing groups, assisting with the Christmas Bazaar/and other activities, and attending a variety of traveling productions that we are fortunate to be able to accommodate in our Latvian Center.

My "growing up Latvian" culminated this year as I fulfilled a lifelong dream to visit Latvia and sing in the Worldwide Latvian Song and Dance Festival. The Latvian Song and Dance Festival is an important event in Latvian culture and social life and has been held since 1873, normally every five years. Our strong culture and unified feeling even kept these festivals alive during soviet and other occupations. The festival in 1990 played a pivot role in the singing revolution and the eventual restoration of Latvia's independence a year later. I have dreamed of singing in this festival all of my life. I sang this summer; united with 15,000 other singers, in a beautiful outdoor amphitheater to another 15,000 spectators...it was beyond all expectations, surreal and beyond words. The other altos next to me were from various parts of Latvia, some from Australia, from Sweden, Norway, all over the world...there were Latvians from over 400 choirs singing together in this most sacred, exalted event. Singing our National anthem

I-539-001

Thank you for sharing your family history and describing the importance of the Latvian Center to you. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-539-001 the first day, I was overwhelmed with emotion. With tears streaming down my face, I looked up to the sky thanking my father (who is buried in Jaunsaule, Latvia where he was born) and my mother who was home in Seattle, for the incredible gift of my Latvian heritage. I did not make it easy for them growing up, but understand the great gift they have given me, now.

Without our Latvian Center, none of this would have existed for me. I am sure I would still be of good moral character and be respectful and have integrity, but I would have half of the life I now have. Please, Sound Transit, do not take our Latvian Center away. It is unacceptable and heartbreaking to even think of the elimination of this type of community gathering place for future generations!

Thank you for your time and attention!

Respected Board Members,

I-540-001 PLEASE be mindful of placing a station in a neighborhood. As you look to plan a station for 185th please remember ~~remember~~ everything that it is not – Not on a major arterial – not the U-district, not Northgate, not MLK way, not MLT transit footprint – but a neighborhood of single family homes.

As a homeowner, voter, taxpayer that moved to Shoreline for the (more affordable than Seattle) houses, schools, parks – please look through the mindset of homeowners in the immediate area to help shape your planning.

Please distribute the impact of a station by placing the garage on the West Side of I-5. – regardless of what plan-station happen South!

Thank you for your consideration. Dan Dale

I will follow-up more via Email.

SOUNDTRANSIT RIDE THE WAVE

I-540-001

Your concerns about the NE 185th Street Station are noted. The Sound Transit Board identified its Preferred Alternative, which includes parking for the NE 185th Street Station on the west side of I-5. Sound Transit will not make a final decision about what gets built until after the publication of the Final EIS.

I-541-001

I have been a member of the Latvian Lutheran Church and Community Center since it was built and the activities at that location are an important part of my life. After examining the Lynwood Link Extension draft plan I'm very concerned that the prefered route, that runs right past the front door of the church will make that location untenable due to the noise and vibration from the passing trains.

Please take another look at the "5th Avenue Option" as an alternative for this project.

SOUNDTRANSIT RIDE THE WAVE

I-541-001

Your concerns about the potential impacts on the Latvian Evangelical Lutheran Church and community center are noted. At the church location, there would be a wall built between the church property and the light rail guideway with the Preferred Alternative. See Figure G-17 in Appendix G of the Final EIS for a visual simulation. Section 4.7 of the Final EIS discusses noise and vibration impacts from the project.

I-543-001

I am bitterly disappointed about the proposed Light Rail plan to disrupt in a major way the well being and perhaps even destroy the existence of the Latvian Lutheran Church and Cultural Center by constructing the Light Rail link between Northgate and Lynnwood. In my lifetime we were forced by the dictatorial regime to leave Latvia with just what we had on our backs. In the United States we were again driven out of the haven that we were using as a cultural and religious Center. Now we are facing a similar fate for the third time

We believe that the Sound Transit has not fully examined nor addressed and given clear responses to our concerns. Frankly, I feel that the Sound Transit doesn't care, except that we are not faced with death this time. There is no meaningful rail alignment option given where the rail bed could be moved few feet westerly. There has been no meaningful concern about the noise, vibration, lights and radio interference nor is there evidence of geotechnical studies having been performed. You have given minimal, if any, concern about the cultural, ethnic and religious impact that this would cause to a very large group of people.

For that reason we respectfully request that you seriously review your plan and provide us with some other workable alternatives.

V. Jodais

SOUNDTRANSIT
RIDE THE WAVE

I-543-001

Your disappointment with the potential displacement of the Latvian Church is acknowledged. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

The EIS has evaluated the areas of concern you note. For the evaluation of potential noise and vibration impacts, see Section 4.7. For potential visual impacts (light), see Section 4.5. For potential radio interference impacts, see Section 4.13. For potential geology impacts, see Section 4.11.

I-544-001

It is my understanding that the current Lynnwood Link Extension project would require the destruction of the current Latvian Center and church in Northgate. I hope that this can be prevented. The Latvian community is very passionate about their current building and location — much work has gone into making the Latvian Center what it currently is. The current center provides access to many aging Latvians (who may have trouble with stairs) and a caretaker's house on the property — both of these aspects are important to the community. I hope the plans can be revised so the current building for the center is saved; there is much love and history in that building and a new one could never truly replace it.

SOUNDTRANSIT RIDE THE WAVE

I-544-001

Thank you for your comments regarding the Latvian Center and church. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Sound Transit
Draft EIS Comments c/o Lauren Swift
401 S. Jackson St.
Seattle, WA 98104

Dear Ms. Swift and Sound Transit:

I am a newly-retired RN who has lived in her home on 12th Ave between 187th and 188th streets for 12 years.

I-545-001

I am writing to express my belief that Option A1 is the best plan for the Lynnwood Link Extension.

- An at-grade station would be less noisy and less visually distracting.

- Placing the parking garage on the W side facilitates/encourages commuter access via Meridian Ave, an established arterial. I'm concerned about the route commuters coming from Lake Forest Park would take to and from the station. 188th street is dangerous at the current level of use; it is narrow with a blind hill/rise. Placing the parking garage on the E side would invite commuters to use 182nd, which cannot accommodate more vehicles.

- Please build for 500 parking spaces. Commuters parking on our narrow, sidewalk-less streets would greatly and negatively impact residents' quality of life.

I-545-001

Your preference for Alternative A1 and concerns regarding neighborhoods, traffic, and access are noted. The Preferred Alternative places the NE 185th Street Station park-and-ride garage on the west side of I-5 with access to 5th Avenue NE. Parking is being planned for 500 spaces with pedestrian improvements across I-5 between the park-and-ride garage and the station.

I-545-001

– Please respect our valuing of our green spaces and Trees and choose plans that preserve them as much as possible.

Thank you for giving this your consideration.

Sincerely,

Mary K Knoll

Nearly Weekly for the past 22 years I've driven from Aberdeen (22 years) Olympia (15 yrs) Tacoma (3 yrs) + Seattle (7 yrs) to join with my Latvian community through dance, song, school, church, various holiday functions, fundraisers, and weddings - even my little sisters wedding reception. They say there is a power to place - this is certainly the case for me. So many memories, joy, + sorrows woven into my life, and into the walls of the Latvian center. My emotional connection to this place is huge, and my weekly pilgrimages fuel me for my work, serving humanity through my clinical practice as a doctor of physical therapy, as well as an adjunct professor at The University of Puget Sound.

My father came to America with his immediate family after years in a displaced persons camp in Germany. Most of the rest of my family was murdered by Nazis in World War II, and my family lost their wealth, their land, their jobs + place in society. Their lives were disrupted forever.

With countless volunteer hours and the sweat of their labor and craftsmanship, they + others like them poured their longing for home into places like The Latvian Center. The building is symbolic, infused with an ache for home, and these immigrants, and I a 1st generation descendant, created home and community in this place - this precious wonderful community center, school, choir + dance rehearsal space, and church.

This place is sacred. It matters. This is home. Please help us respect and care for our precious home. We've lost so much. Please help us preserve + protect our sacred space.

Sincerely, Dina Macs DPT OCS PT

Subject: Seattle Latvian Evangelical Lutheran Church and Center

I-547-001

I would like to express my deep concern about the threat to the Seattle Latvian Evangelical Lutheran Church and Center as a result of the proposed Lynnwood link. This church and center has been such an important cultural hub for my family and all the Latvians, Lithuanians and Estonians in the Seattle area. It is a place where my children have learned of their heritage and would be impossible to replace. It continues to be a center for all our important cultural traditions. Please consider preserving our center in your plans!!

I-547-001

Thank you for describing the importance of the Latvian Evangelical Lutheran Church to you. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

To Sound Transit and the Counsel,

I-548-001

I question all the decisions made by the Shoreline Counsel. I believe Shoreline makes many decisions that are never voted on by the people and that is not fair. Many people voted for light rail, but they didn't have all the facts. For example, where the stations would be, who would be impacted etc. Will people get out of their cars to even take the rail and how will that affect the buses?

Shoreline spends so much money. For example the trail from 150th to 200th cost some 13 million dollars. I rarely see people even walking on this trail. WASTE, WASTE, WASTE is Shoreline's motto.

Most of the decisions about light rail affect people east of the freeway. Yet those west of the freeway should not just think of their own interests. Each and every aspect of this light rail should be voted upon. Perhaps they move too quickly without thinking of the consequences. Let's slow down and reconsider the consequences. Also a station at 185th is a poor location. I live in Edmonds and would never use that station. Perhaps I would use the Ballinger area. That is a better location. Still in this economy we should think twice about all these decisions and put things before the people to vote on. Example: plastic vs paper bags. The community should vote on everything

Personally, I'm against light rail. I question if it will really be used, and now we're in competition with buses. If the rail sits vacant, who pays all the costs? I'm really concerned about Shoreline and how they do business.

Please think seriously about this rail and where the stations will be located. Thank you for reading this letter. A concerned citizen,

Carolyn Moore

I-548-001

Your comments against light rail are noted. The Sound Transit 2 package that voters approved in 2008 included this project and indicated likely station locations. The City of Shoreline is not a financial partner for the Lynnwood Link Extension.

I-549-001

In 1944 my parents and sister left their home in Latvia with my Dads neighbor and best friend and family, as the tanks and the front approached three miles from their homes. My grandparents, all my aunts and uncles and cousins were left behind as the borders closed and the communists took control. They lived in (my parents) Displaced persons camps in Germany for 7 years until they came to America. I was born 2 yrs later. The Latvian Center became a place for all of us to get together as a family - especially those with none. My father was building he helped build the Center with many others who are now gone. The Center was a place to learn the Latvian Culture and Language. I was a single parent but I raised two University of Wash graduates. I contribute this to what I learned and passed on as a Latvian. The Center was paid for by hard working Latvians. Please consider alternatives and save the Center. *

SOUNDTRANSIT RIDE THE WAVE

I-549-001

Thank you for describing your family's history and the importance of the Latvian Center to you. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

This applies to all Light Rail Stations.

I-550-001

1.**Residents need to vote on these decisions and demand that they be voted on**. Just because people voted for light rail does not mean they have agreed to all the light rail plans. They should be aware what each station costs, decide how many we need and vote on where they would be located. They should know how many people will be impacted, and the number of homes and businesses that need to be relocated. All the impact is on the East side of the freeway. Decisions are made by an elected few. Most, if not all, are living on the West side of the freeway. They were elected to represent all of the people, People believe they have already made up their mind on what they are going to do and these meetings are just to let the people vent. I agree.

I-550-002

2. **Any stations should be located near the already existing freeway exits and already existing parking areas, not in the middle of the communities. Traffic will increase making it unsafe and crime will increase as well.** Making a 500 car parking garage and trying to bring cars into the area will destroy the quality of peoples lives. The 185th station is a perfect example. Seniors and young adults use the churches, senior center, stadium, pool and tennis courts. There is a lot of pedestrian traffic in that area. They don't need more car traffic. Shoreline officials, not the transit company is and has all along pushed for this 185th station and put it in all their options. A better option would be to put it on the North side of Ballinger way . **Shoreline would only need one station at 145th** . The Ballinger way station would be used by Edmonds, Lk Forest Park, Shoreline, Mt Lake Terrace. Shoreline is just diving in and has out of control spending of our already too high taxes and the money from the federal government is also coming out of ours and our children's pockets.

I-550-003

3. Of course they will need riders to pay for this. The people I have talked to will not be riding the train and they expect trains to be empty like all the bicycle paths are. How much has been spent on bicycle paths? How many people are using them? How much did that overpass cost that is on 155th & Aurora. Shoreline wants to get rid of the single family homes and make multiplexes and microplexes increasing the density for more revenue and put them near the stations so they will have more riders. They say its for the low income and seniors but they need to say this to get money from the federal government. Seniors need to be safe. Crime will increase and traffic will make it unsafe for them. **Again a few people can change the codes and offer building incentives to carry out their vision without the residents voting on them. We are letting a few people determine how we will live. Residents need to be informed with the Pros and Cons and Vote on everything.** We can stop this if we all work together. People need to get involved now. Single family homes are being taken down and builders are getting incentives to do this. Look at the Ballard area and their new plans for microplexes (43 units with only 6 kitchens) on a 5000 sq ' lot where there was one single family home. Drive to North City 175th & 10th Ave. It is starting to look as bad as Ballard.

I-550-004

4. I believe that the best choice for a train would have been to go to Northgate and then Hwy 99. Others say it should always have followed Hwy 99. They could use existing

I-550-001

The Lynnwood Link Extension is part of the Sound Transit 2 program of projects, which was approved by voters in 2008. The final decision regarding what will be built will be made by the Sound Transit Board after publication of the Final EIS.

I-550-002

Section 3.2 outlines anticipated long-term operation transportation impacts such as increased traffic congestion, and Section 3.6 identifies mitigation measures that Sound Transit commits to implement to prevent a worsening of project conditions without the proposed light rail system extension.

The City of Shoreline is not a financial partner with Sound Transit for the construction and operation of the Lynnwood Link Extension. See Section 5.3.1 for additional information.

I-550-003

Your concerns regarding density are noted. Zoning is the responsibility of the City, not Sound Transit. Section 4.14 discusses safety around station areas. Typically, crime at stations reflects the conditions of the surrounding neighborhood.

I-550-004

Construction of a high-capacity transit system from Northgate to Lynnwood following Aurora Avenue (Highway 99) was considered in early planning studies for the project. Please see the *Alternatives Analysis Report* in Appendix K. The final evaluation showed light rail alternatives along Aurora Avenue would be substantially more expensive due to acquisition of right-of-way along the entire length in order to widen the roadway and lower ridership.

I-550-004 transit parking. Riders would have the option to use bus or train and have it go to Lynnwood and then to Everett. A few stations could be made now and more added as needed. This would be more fiscally responsible. Land for stations could be purchased as it becomes available. Noise would not be a factor.

I-550-005 5. **When there is a decision to have level or elevated they should always choose the one that would not take peoples property. Level uses more property**. When they do take property they should offer 2x the current property value so the person would have a good chance to find a new home instead of being put out of the housing market.

I-550-006 6. The people along the freeway have to constantly hear the traffic and noise from the freeway. **It is unfair to run the train along the freeway increasing the noise and also the additional noise at the stations of the trains arrival and departure.** No one cares about those people. Most of them are older homes, lower income and Seniors. Its more like get out of the way the train in coming and if you don't like it move.

P.O. Box 55392
Shoreline WA 98155

I-550-005

Sound Transit developed the alternatives considered in the EIS based in part on their ability to minimize acquisitions, compared to other possible alternatives, but some property acquisitions will be unavoidable. Section 4.1 discusses Sound Transit's mitigation for acquired property.

I-550-006

The noise analysis for the Lynnwood Link Extension uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below these criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Noise walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts.

I am writing in regards to the impact the current option will have on the Latvian Lutheran Church & Culture Center in Northgate I am the caretaker and have been for the last 26 years. This complex is more than you can imagine. We have visitors here from all over the world.

Please reconsider. Save our Church!

Sincerely,

Selga Petersons

SOUNDTRANSIT RIDE THE WAVE

I-551-001

Thank you for your comments about the Latvian Lutheran Church. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property. The caretaker's house would be displaced, but Sound Transit will help with its relocation, consistent with relocation policies as described in Section 4.1 of the Final EIS.

To Whom It May Concern,

I-552-001

My name is Oskars Poukens, and I am you writing regarding the Lynwood Link DEIS issued July 26, 2013. It may surprise you that a comment regarding this situation is arriving from California, but I hope you will nonetheless take my opinion to heart, even though I may not be a member of your voting block. It is my sincerest hope that the time I take now, to write you from over 800 miles away, is not wasted, but helps to bring to your attention the importance of the dire situation which you have created for the Seattle Latvian Community Center.

The Latvian Community Center serves as a Sunday school, church, holds choir practices and dance practices, hosts rummage sales and bazaars, plays and more. It is a wonderful place where we can meet and socialize and strengthen our community bonds. We are fortunate enough to have a center here in San Francisco, and I could not even imagine the hit our community would take if someone were to take that away from us. My friends in Washington have reached out to me and I am writing on their behalf, because any loss in our community is all our loss.

I do not doubt for a moment that the proposed changes – whether "just" losing ingress/egress and parts of the lot, or losing the property as a whole – would be devastating to the Seattle Latvian Community. While I am absolutely supportive of public transportation expansion, I wonder if there are no possible alternatives to this. The Seattle Latvian Center is a unique and irreplacable place for the Seattle Latvian Community, and it would be wildly difficult if not impossible for the community to replace this building were it taken away from them. Finding another building that so perfectly suits all of their needs would be difficult enough, but at this point in time, thinking financially, I think it would be impossible.

I sincerely hope that the efforts of our community to reach out to you do not go in vain. I am certain that we can find a solution that will still enable an expansion to the public transport line, but no longer put the Seattle Latvian Community Center in peril. I hope that you will work with us to protect this dearly loved fixture of the community.

Sincerely,

Oskars Poukens

I-552-001

To Whom It May Concern,

I-553-001

My name is Ilze Pukite, and I am you writing regarding the Lynwood Link DEIS issued July 26, 2013. It may surprise you that a comment regarding this situation is arriving from California, but I hope you will nonetheless take my opinion to heart, even though I may not be a member of your voting block. It is my sincerest hope that the time I take now, to write you from over 800 miles away, is not wasted, but helps to bring to your attention the importance of the dire situation which you have created for the Seattle Latvian Community Center.

The Latvian community is one of the most closely knit communities I have ever had the honor to be a part of. Our culture is a small one, and our home country of Latvia has a population just barely topping 2 million – less than a fifth the size of LA. However, our people are strong, and united. When Latvia was occupied by the USSR, thousands of Latvian refugees fled the country, and many found save haven in the United States. There, we found solace in each other, and vowed to keep our language, traditions, and history alive, despite the tragedies back home. To this end, we created Latvian Centers all across America – including Seattle.

These community hubs served as schools, dance centers, churches, choir halls, and homes. They host everything from Christmas bazaars to rummage sales, to folk dance performances and evenings of song. I have fond memories of the Latvian Center in Seattle, when my mom and I would occasionally drive up from Portland, where I grew up, to participate in an event or see a Latvian group performing. These centers provide so much for the communities they serve – they inspire children to take pride in their heritage, they give our seniors opportunities to socialize, and they unite us as a community.

I do not doubt for a moment that the proposed changes – whether "just" losing ingress/egress and parts of the lot, or losing the property as a whole – would be devastating to the Seattle Latvian Community. While I am absolutely supportive of public transportation expansion, I wonder if there are no possible alternatives to this. It is, quite frankly, shocking to me that this plan has gotten so far. I wonder that at no point during the propositions for this expansion did anyone think to wonder what this building was, and, if they did inquire as to its usage, did they really think it should be razed nonetheless? Were this new construction going to have to go through a 7-11, well, I think the world would be quite indifferent, as there is one on every corner. Of Latvian Centers, however, we have very little, and the community it supports would be very hard pressed indeed to find a replacement, let alone afford the move.

I sincerely hope that the efforts of our community to reach out to you do not go in vain. I am certain that we can find a solution that will no longer put the Seattle Latvian Community Center in peril, and I hope that you will take the necessary steps to protect this dearly loved fixture of the community.

Sincerely,

Ilze Pukite

The Latvian Church and Center have been my second home for the last 40 years. For many of those years my family used the Center 4 to 5 times a week. My son and daughter live in Seattle and continue going to the Center for many different functions. My daughter is already involved in planning for the upcoming Christmas Bazaar. I will also be helping there.

Even after moving to Lacey, WA. I continue to make the trip to the Latvian Center (often through traffic congestions around Tacoma and I5/I7) so I understand the need for Light Rail.

I feel that the Light Rail should run at ground level and hope that access to the Latvian Center + Church is not lost.

Thank you for listening.

Ilze

I-559-001

I, David C. WILLIAMSON, live in the CEDAR CREEK CONDO-MINIUM and have made comments before on objecting (opposing) your C-1 and C-2 alternatives in favor of C-3. I must ask for the geology of the area to be SERIOUSLY noted and acted on ESPECIALLY with EARTH-QUAKES. The Nisqually Earth quake in 2001 was the last one I have personally lived through. At 6.8 on the Richter Scale and its epi-center 32 miles under ground the damage it caused would be mild in comparison to the next Cascadia mega-earthquake. The last occurred on January 26, 1700 (and was about a 9 on the scale) when few people lived here. Brian Attwater of USGS and David Yamaguchi are your best sources, CONSULT, for the Scriber Creek wet lands could liquid-fact the ground under your piers and lead to collapse in a large quake

SOUNDTRANSIT RIDE THE WAVE

I-559-001

Your preference for Alternative C3 is noted. The EIS includes a summary of the geologic hazards that have been identified in the project areas, including the Scriber Creek area. The project design will address identified geologic hazards, and will include earthquake engineering in accordance with applicable building codes. Earthquake engineering includes evaluations of and design for ground shaking, liquefaction, lateral spread, liquefaction-induced settlement, and seismically induced slope instability. The earthquake engineering building codes incorporate USGS research on hazards from identified faults in the Puget Sound area, including the Cascadia subduction zone.

Draft EIS Comments
c/o Lauren Swift
401 S. Jackson Street
Seattle, WA 98104

Dear Lauren Swift and Staff,

I-560-001

40 years ago I helped design the Latvian Center. Edvins Circenis was in charge of the overall design and he and I chose everything that went into the building. Every capable person in the Latvian community helped build the church and the hall next to it, as well as all the school classrooms/meeting rooms on the second level of the hall.

Soon after the center was built my youngest son was christened in the church.

30 years ago we celebrated my grandmother's 100th birthday in the community hall.

During these years all of my kids got up on Saturday mornings, missed the cartoons, and attended school in those classrooms. . For all these years there have been weddings, celebrations of births, christenings, confirmations, folk dance rehearsals and dances, play practice and theatre, community choir rehearsals and community choir performances, ladies aid "quilts", seniors' evenings ---and funerals.

Now my grandkids get up on Saturday mornings and go to the same school as did their fathers. The next generation to take charge is coming right up.

Two years ago my youngest son christened **his** youngest son and there was a huge celebration in the hall afterwards, as there always is.

Yesterday, September 22, 2013 The President of Latvia, Andris Bērziņš, spoke to all of us gathered in a full hall, and at least 5 generations celebrated that event.

Subject: Lynnwood Link - Route C3!!

I-561-001

Hello - would someone kindly acknowledge that this email has been received? I will not be able to attend the community meeting in Lynnwood on Saturday regarding the Route Alignments, and I want to be certain that my opinion/preference is noted and considered.

As a Lynnwood homeowner for 24 yrs, and a home-based small business owner for over 20 yrs, I feel the ONLY possible and acceptable route that should be considered for the track alignments through the City of Lynnwood is the one called "C3". This option not only spares our parks and wildlife, but also homes and businesses and will cause the least amount of interruption to our daily life here in the City we call home.

I appreciate your consideration and I am hopeful that the correct choice will be made. Thank you.

Best,
Linda (Melinda) Zopfi

I-562-001 | I think the station should be at 155th St.

1

I-562-001

Your preference for a station at NE 155th Street is noted.

Shoreline Fire Department
Dedicated to the Protection of Life and Property

FIRE CHIEF
Matt Cowan

COMMISSIONERS
Ken Callahan, Jim Fisher, David Harris, Rod Hellvin, Jon Kennison

July 29, 2013

RECEIVED
AUG 14 2013
SOUND TRANSIT
BOARD ADMINISTRATION OFFICE

The Honorable Pat McCarthy
Chair, Sound Transit Board
401 South Jackson Street
Seattle, WA 98104

RE: Support or Light Rail Station at NE 145th Street in Shoreline

Dear Chair McCarthy:

L-001-001 The Shoreline Fire Department would like to offer its support for designating a Light Rail Station at NE 145th Street in Shoreline as part of Sound Transit's Lynnwood Link Extension Project.

We strongly support a station at NE 145th and I-5 as it will serve as a regional station. Due to its proximity to Bothell Way NE/Lake City Way NE (SR 522), the NE 145th Street station will act as a regional station for residents of Lake Forest Park, Kenmore, Bothell and potentially points east, and northwest Seattle residents. We believe that convenient access off main thoroughfares is the most appropriate location for a regional station.

L-001-002 In addition, we are concerned that a station at 155th Street may interfere with our existing Fire Station just east of I-5 and therefore may negatively impact response times due to increased bus and vehicle traffic the station would generate. Further, depending on the specific design of the rail line itself and/or the station and the subsequent increase in traffic, we may have to consider moving the facility all together.

L-001-003 The City of Shoreline has already begun station area planning which includes increasing density around stations to facilitate transit-oriented development. Part of that commitment is to increase pedestrian and bicycle access and improvements to the road network to facilitate transit to serve the stations. The City is also pursuing ownership of 145th Street in order to improve the transportation facilities for vehicles, buses and non-motorized users; therefore, helping to improve the access to the station.

L-001-004 The Shoreline Fire Department strongly urges you to designate NE 145th Street as a station location as it supports greater regional access, provides opportunities for improved transit and non-motorized transportation facilities, and allows for greater opportunities for transit-oriented development.

Thank you for your time and consideration of this important issue.

Sincerely,

Matt Cowan, Fire Chief
Shoreline Fire Department

17525 Aurora Avenue North • Shoreline, WA 98133 • PHONE: (206) 533-6500 • FAX: (206) 546-5719
www.shorelinefire.com

L-001-001

Thank you for your comment stating a preference and reason for preferring the station at NE 145th Street in Shoreline.

L-001-002

Sound Transit is aware of the Fire Department's concerns about the possible impacts of a light rail station at NE 155th Street on operations of the fire station at that location. If this station were to be advanced as part of the project, Sound Transit would further define measures to manage traffic serving the station while maintaining effective access for the fire station. Sound Transit would work closely with the city and the Fire Department to resolve potential conflicts with bus and vehicle traffic and to maintain emergency response times and access during the construction period and operation of light rail. However, the Preferred Alternative does not include this station site.

L-001-003

Thank you for noting the City of Shoreline's station area planning efforts around the NE 185th Street Station and at the NE 145th Street Station; the Draft EIS and the Final EIS both note the City's preference for these stations and include information about station access.

L-001-004

Thank you for the comment stating a preference for the NE 145th Street Station in Shoreline. This letter was noted in the materials provided to the Sound Transit Board, prior to their selection of the Preferred Alternative for Segment A, which includes a NE 145th Street Station.

Sound Transit wants to hear from you. Comments can be about anything related to the project, ranging from giving an opinion or observation to discussing technical aspects of the environmental analysis. The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

Comments

L-002-001

The main water feed from AWWD to the City of Mountlake Terrace follows the Interurban South along I-5 to 44th Ave W @ the pedestrian bridge. Please work with the District to ensure that supply is maintained during construction.

SOUNDTRANSIT RIDE THE WAVE

L-002-001

Thank you for noting the importance of the District's main water line serving Mountlake Terrace and its proximity to the project. In producing the Final EIS and for the Preliminary Engineering for the Preferred Alternative, Sound Transit continued to identify utilities with potential conflicts; any plans for constructing the project would include a commitment to maintain service on significant connections such as the water line, and Sound Transit will continue to coordinate with the District during final design and construction.

Sound Transit DEIS Comments
c/o Lauren Swift
401 S Jackson St.
Seattle, WA 98104

RE: Support for Siting Light Rail Station at 145th in Shoreline

Dear Sound Transit:

L-003-001 The City of Lake Forest Park has a vital interest in the outcome of the final decision on the siting of the Link stations for the Lynnwood Link Extension. Our residents have supported the objectives of Sound Transit since its inception and have long anticipated the promise of service commensurate to accommodate the need for regional transit service to the north-end cities beyond Seattle city limits.

Sound Transit representatives updated the City at our May 9, 2013 City Council meeting regarding the status of the Link stations still under study.

We would like to express our support of the following:

- Alignment of the Link Light Rail along the east side of the I-5 alignment through segments 'A' and 'B'.
- Locating segment 'A' stations at NE 145th and NE 185th Streets, as supported by the City of Shoreline.
- Providing adequate Park N Ride facilities at or very near Link stations is extremely important for system access by our citizens.
- Providing adequate bus capacity to serve the communities close to the stations.
- Designing stations to preserve the free-flow of east/west vehicular traffic, bicycle and pedestrian access across the I-5 alignment and to prevent choke points.

L-003-002 The City Council of Lake Forest Park recently passed the Southern Gateway Sub Area Plan zoning changes which allows for residential development and higher density along the SR-522 corridor beginning at 145th. The City committed significant time and resources to this planning effort, recognizing the need for housing along the transit corridor.

L-003-001

Thank you for your comment stating the City's overall support for the project, its preferred alignment and station locations, as well as other aspects of the project the City is encouraging. The Final EIS includes further information about how the Preferred Alternative and other alternatives would provide transit access and parking while maintaining effective multimodal access and circulation around stations.

L-003-002

Thank you for providing additional details about the City's progress in developing the Southern Gateway subarea plan and the need for improved transit access. The added density and provision for housing along the corridor connecting to a NE 145th Street Station are consistent with the future patterns of growth that Sound Transit anticipates in ridership forecasts for the project.

L-003-002 Even with this housing in place, the majority of Lake Forest Park residents intending to use mass transit will continue to face the challenge of accessing transit options. Our physical geography and terrain make regular transit circulation service within the city impractical, and our citizens are forced to travel to transit system access points.

Siting stations on the east side of the I-5 alignment and providing parking in their immediate vicinity will allow them that access. Stations at 145th and 185th would provide Lake Forest Park with direct access to Link more than any of the other stations currently under study, and would provide an even 40-block separation between stations more effectively serving the population while maintaining system efficiency. As the configuration of SR-522 at Seattle's northeast boundary constricts all traffic on SR-522 southbound, the access to a 145th St station for commuters is essential and needed.

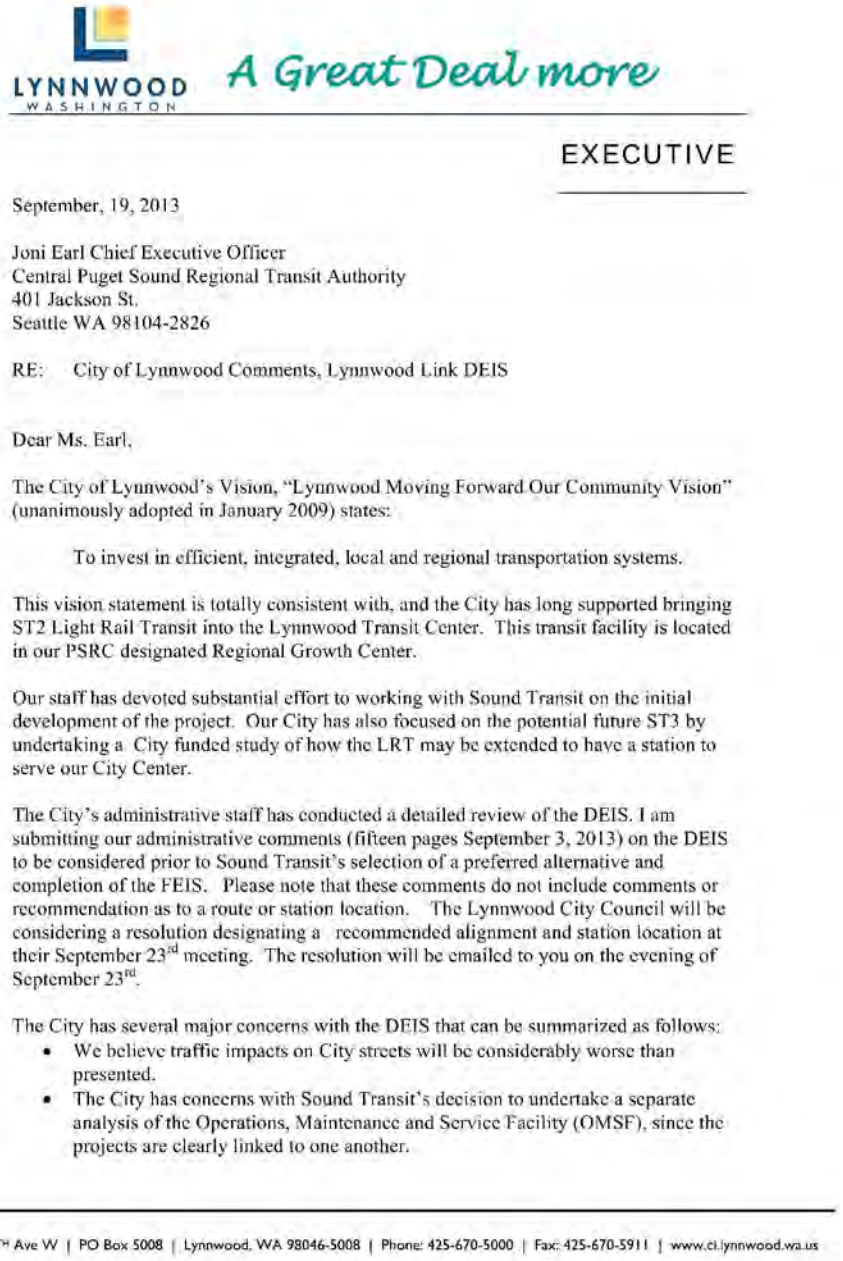
SR-522 helps to provide linkage to the UW Seattle and UW Bothell. A Link station at 145th (SR-523) would help to provide the first step towards regional transit access from the east side of Lake Washington to the Shoreline Community College. This route would be an excellent application for future bus rapid transit (BRT).

We appreciate your consideration of the needs of our citizens.

Sincerely,

Mary Jane Goss

Mary Jane Goss
Mayor



LYNNWOOD
WASHINGTON

A Great Deal more

EXECUTIVE

September, 19, 2013

Joni Earl Chief Executive Officer
Central Puget Sound Regional Transit Authority
401 Jackson St.
Seattle WA 98104-2826

RE: City of Lynnwood Comments, Lynnwood Link DEIS

Dear Ms. Earl,

The City of Lynnwood's Vision, "Lynnwood Moving Forward Our Community Vision" (unanimously adopted in January 2009) states:

To invest in efficient, integrated, local and regional transportation systems.

This vision statement is totally consistent with, and the City has long supported bringing ST2 Light Rail Transit into the Lynnwood Transit Center. This transit facility is located in our PSRC designated Regional Growth Center.

L-004-001

Our staff has devoted substantial effort to working with Sound Transit on the initial development of the project. Our City has also focused on the potential future ST3 by undertaking a City funded study of how the LRT may be extended to have a station to serve our City Center.

The City's administrative staff has conducted a detailed review of the DEIS. I am submitting our administrative comments (fifteen pages September 3, 2013) on the DEIS to be considered prior to Sound Transit's selection of a preferred alternative and completion of the FEIS. Please note that these comments do not include comments or recommendation as to a route or station location. The Lynnwood City Council will be considering a resolution designating a recommended alignment and station location at their September 23rd meeting. The resolution will be emailed to you on the evening of September 23rd.

The City has several major concerns with the DEIS that can be summarized as follows:

L-004-002

- We believe traffic impacts on City streets will be considerably worse than presented.

L-004-003

- The City has concerns with Sound Transit's decision to undertake a separate analysis of the Operations, Maintenance and Service Facility (OMSF), since the projects are clearly linked to one another.

19100 44TH Ave W | PO Box 5008 | Lynnwood, WA 98046-5008 | Phone: 425-670-5000 | Fax: 425-670-5911 | www.ci.lynnwood.wa.us

L-004-001

Sound Transit appreciates the City's collaboration through the Draft EIS preparation for the Lynnwood Link Extension and in the planning efforts for ST3.

L-004-002

The traffic analysis around the Lynnwood Transit Center Station has been updated for the Final EIS, including using Vissim software and expanding the coverage area to include the intersections related to the 196th Street/Poplar Way interchange. The scope of this revised analysis was coordinated with the City of Lynnwood, and is discussed in more detail in the Final EIS Transportation Technical Report.

L-004-003

Section 2.8.1 of the EIS describes the separate utility of the proposed Operations and Maintenance Satellite Facility (OMSF) under NEPA and SEPA. Sound Transit is currently developing a separate EIS for the OMSF, which evaluates operations and maintenance needs across the Sound Transit district and is not focused on a specific corridor. The Draft EIS for the OMSF was issued in May 2014.

LYNNWOOD
WASHINGTON
EXECUTIVE

L-004-004
- Sound Transit's expectation that 80% of riders will arrive by bus appears to be very optimistic. Failure to achieve this goal will result in significant traffic congestion and an extreme shortage of parking which will substantially interfere with properties in the area and will quite probably impact negatively our ability to achieve the goals of Lynnwood's City Center Plan.

L-004-005
- The analysis of C3 contains substantial errors as to which properties east of 44th Ave. will be demolished and taken. Further, C3 fails to consider impacts on our critical Lift Station 10 which is planned for expansion, has associated odor issues, and there is localized flooding in the same area.

L-004-006
- The DEIS fails to consider the implications that decisions made now with ST2 will pre-determine impacts that the potential ST3 will have on the City Center block located east of 44th Ave.

L-004-007
On behalf of the City I want to thank you for considering the City's administrative comments. I especially and sincerely appreciate your willingness to agree to my request that the DEIS comment period be extended substantially beyond the normal time period. This was very helpful for many of our residents to participate when they would have otherwise been doing summer vacations or related activities.

Sincerely,

Don Gough
Mayor, City of Lynnwood

CC: Sound Transit Board
Steve Kennedy, Sound Transit Staff

Attachments

19100 44TH Ave W | PO Box 5008 | Lynnwood, WA 98046-5008 | Phone: 425-670-5000 | Fax: 425-670-5911 | www.ci.lynnwood.wa.us

L-004-004

The Final EIS has updated estimates for ridership and preliminary concepts call for even more connecting transit service when the light rail opens. However, the forecasts take into account the patterns of ridership that exist today, which has a fairly high number of riders reaching the Lynnwood Transit Center using transit. In addition, the estimated level of riders arriving by bus at the Lynnwood Transit Center Station reflects ridership for the entire day. Park-and-ride access would be higher during the peak period, while bus access would be higher during midday when parking is full, as is seen in many other areas in the Sound Transit system. The Final EIS also defines measures that would minimize the potential for spill-over parking into surrounding areas.

L-004-005

Sound Transit, in coordination with the City of Lynnwood, developed a modified Alternative C3, which was evaluated in the Final EIS and defined measures that would avoid impacting the City's ability to upgrade Lift Station 10. The property acquisition information for Alternative C3 has been updated in the Final EIS, including the error on page 4-29 of the Draft EIS that indicated that the La Quinta Inn would be displaced.

L-004-006

The Draft EIS did not include a detailed assessment of impacts to individual properties because any extension would need to be part of a future ST3 program that has not yet been fully defined or approved. While it would be speculative to identify specific properties, particularly given the lack of information on timing, the Final EIS does discuss under cumulative impacts the likely level of impacts that could occur.

L-004-007

Thank you for your comment.

Sound Transit Lynnwood Link DEIS
City of Lynnwood Comments
September 3, 2013

1. **General Comment:** Sound Transit has provided analysis of three track alignments and station locations referred to as C1 (north along 200th), C2 (middle route above existing bus platforms) and C3 (southern). Each option presents significant issues.
   - C1-Noise and visual impacts to homes along 52nd, impacts to Scriber Creek Park, removal of many homes and business along 200th
   - C2- Noise and visual impacts to homes along 52nd similar to C1, impacts to Scriber Creek wetland
   - C3-Poor location for supporting City Center development, potential impacts to a major City sewage lift station (10) and potential flooding issues and major property takes/ loss of development potential on the block east of 44th (La Quinta Inn, Veterinary Building and others), poor access to bus transfers unless a completely new bus facility closer to the station is built at public expense.

2. **General Comment:** Sound Transit staff has referred to the three alternatives as "bookends" indicating that variations of the alignments may in fact be possible. Staff believes that an option we are calling "C3 Modified" is worthy of study. As envisioned it would leave the I-5 ROW at the same point as C3, eliminating direct impacts to homes along 52nd, avoiding Scriber Creek Park and the need to acquire homes and businesses along 200th. It would run over the rear of the School District property, behind their proposed building over an open area designated for outdoor bus parking. It would enter the Transit Center on an angle, running northeast. The station would be located near the existing bus platforms supporting intermodal access and eliminating the cost of relocation. The tail track would be aimed in the general direction of the intersection of 200th and 44th in such a way that under ST3 the line could be extended over or adjacent to Alderwood Mall Boulevard thereby avoiding most of the properties on the block east of 44th . This alignment would offer a station location that creates good development potential (due to better access) in City Center. This option would also avoid impacting City Lift Station 10 which is planned for a major expansion, associated odor issues and potential flooding problems experienced in that area. C3 Modified is presented in a map attached to this document.

3. **General Comment**: The Lynnwood Link DEIS contains a critical flaw. In spite of earlier requests by the City, the DEIS disregards the impact result directly from ST2 decisions when ST3 is advanced. The three track alignments and station locations in Lynnwood will of necessity result in three different alignments of track extensions under ST3 when this project advances. The three alignment options therefore have an immediate, direct and immutable impact upon the entire block bounded by 44th Ave. W, 40th Ave. W, Alderwood

L-004-008

The City's concerns for Alternative C1 are noted and are addressed in more detail in response to your comments below.

L-004-009

Thank you for your comment. Responses to these comments are provided where they are discussed in greater detail in your comment letter.

L-004-010

Thank you for identifying the City's concerns with Alternative C3; modifications of Alternative C3 developed with Lynnwood staff have reduced impacts on the block east of 44th Avenue W and improved the light rail station/transit center connection. This modified Alternative C3 is evaluated in the Final EIS.

L-004-011

The Final EIS incorporates and examines in detail Alternative C3 Modified, which was developed in coordination with the City.

L-004-012

The Draft EIS did not include a detailed assessment of impacts to individual properties because any extension would need to be part of a future ST3 program that has not yet been fully defined or approved. It would be speculative to identify specific future properties for acquisition and displacement, particularly given the lack of information on timing and the potential that future projects could involve alternatives that avoid the next property or properties. However, the Final EIS does discuss under cumulative impacts the likely level of impacts that could occur for each alternative. This includes the modified Alternative C3, which avoids some of the properties of concern to the City.

L-004-012

Mall Boulevard and I-5. This block is located within Lynnwood's City Center-Core which is planned for the highest density urban development in Lynnwood. Redevelopment of this block is critical to realizing the goals of the City Center Plan and also to achieving the goals of the State Growth Management Act and designated Puget Sound Regional Council's Regional Growth Center. Impacts of the planned but as yet unfunded ST3 extension in this area must be assessed to provide a full analysis of the impacts from Lynnwood Link. As presently designed, the C1 alignment would allow for the track extension to align with Alderwood Mall Boulevard offering the probability of the lowest amount of impact on the City Center Core block for the future extension. C2 has some potential for impacts from a future extension on the southwest corner of the City Center Core block although the City has been informed that it may be possible to route the track in the vicinity of I-5 and the Interurban Trail thereby minimizing impact on the block. C3, whose tail track has a significant immediate impact upon the City Center Core block in the current ST2 phase of Sound Transit's expansion, under ST3 results in splitting the triangular block in half rendering it difficult or impossible to redevelop in any meaningful manner. Further, is this centerline is extended further it appears that additional City Center blocks further east could be impacted as well. We also note that the DEIS erroneously states that C3 will require removal of the La Quinta Inn when in fact it will require removal of a multi-story office building located west of the hotel. The La Quinta appears to be able to remain at this point although it appears that it could be significantly impacted by having the tail track proximate to and aimed at their upper floors. As such Alternative C3 removes this block slated for the highest density development in the Lynnwood Regional Growth Center from being utilized as planned and runs counter to both the purpose and need statements (pages S-2, 1-4, 1-5 and 5-2) for the Lynnwood Link project and to the Federal New Starts Economic Effects criteria to support the project's funding (p. 5-13).

L-004-013

4. **General Comment:** Sound Transit is assuming the some 16,000 of the 20,000 daily boardings at Lynnwood will be arriving by bus in the form of intermodal transfers. The DEIS does not appear to contain an analysis of whether the bus providers have sufficient capacity to handle this increase in ridership and if not, how they will be able to obtain funding to achieve it. The City is also critically concerned that the significant increase in bus movements combined with parking for 500 additional cars, most of which would occur during a short period of time (peak hours) will significantly impact Lynnwood's street system in ways the DIES fails to analyze. While some of the bus routes will use the direct ramps to I-5, many more along with all the automobile traffic will use local streets that already have capacity issues. In addition, many of the commuters will arrive from points north of Lynnwood. The closest I-5 interchange this traffic can use is at Poplar Way. Sound Transit's traffic analysis fails to assess this impact.

L-004-013

An analysis was conducted regarding the capacity of local bus service to accomodate the increased demand, and it was determined that buses would not be overloaded. Also, while Sound Transit does not have authority over funding for improvements to local bus transit service, Sound Transit will coordinate with Community Transit in the development of appropriate modifications to local bus service to best accommodate demand at the station. Regarding traffic arriving from points north of Lynnwood, an updated analysis has been performed using microsimulation to better capture congested conditions, which is reflected in the Final EIS.

L-004-014

5. **General Comment**: All references to Lynnwood creating a Town Center need to be changed to City Center.

L-004-015

6. **S.2 Purpose and Need for the Lynnwood Link Extension, P. S-2:** Purpose and need for the Lynnwood Link Extension: The project is needed to… *Create the transit infrastructure needed to support the development of Northgate and Lynnwood (language proposed by the City)*- the corridor's two designated Regional Growth Centers.

L-004-016

7. **S.9, P. S-31 and 5.3.4, P. 5-15 Areas of Controversy and Issues to be Resolved:** The DEIS claims that both Lynnwood and the Edmonds School District "expressed concerns" regarding the potential location of the Operations and Maintenance Satellite Facility (OMSF), in Lynnwood. This statement incorrectly characterizes the positions of the City and School District. Both Lynnwood and the District opposed the designation of an OMSF site in Lynnwood in writing (in Lynnwood's case a Resolution adopted by the City Council) and in verbal comments offered at the ST Board Public Hearing. The many obvious flaws of this site were pointed out including its location directly across the street from hundreds of affordable homes, impact to critical wetlands and the fact that the School District has approval to build their Administration complex on the site. Both the City and District asked the ST Board to eliminate the Lynnwood OMSF site from consideration. The Board went ahead and approved consideration of the site along with others in Bellevue. It is also significant to note that the two Board representatives from Snohomish County stated on the record that by voting to approve consideration of the Lynnwood site, they understood its many flaws. Further, it was their desire to see an OMSF located not in in Lynnwood, but rather near Payne Field when ST3 is built.

L-004-017

8. **Table 2-1c Alternatives Considered, Summary of Design Features for Segment C Alternatives, P. 2-13**: Description of the alternatives ends at the Lynnwood Transit Center. The table fails to mention that the C3 tail track will extend across 44th Ave and require removal of buildings east of 44th or the resulting impacts from ST3 extensions that would result from ST2 decisions.

9. **2.5.2 Alternatives Considered, Developing Details of the Alternatives, P.2-35:** "The evaluation criteria included the following factors: … Station area development potential (existing land use **and** transit-oriented development potential". The DEIS focuses on existing land use for alternative C3 and fails to mention impacts of C3 on the high density development potential dividing the block north of 44th in half with its tail track. We disagree that the alternative C3 station location has the same development / TOD potential as C1 and C2 which are closer walking distances to the City Center, (within the PSRC Lynnwood Regional Growth Center slated for highest development potential in Lynnwood). P. 4-18 states that Segment C ends within the Lynnwood City Center, inside of the PSRC -

L-004-014

The Final EIS has been revised to change "Town Center" to "City Center."

L-004-015

The comment appears to state the purpose and need as it was published; it is unclear what other language the City is proposing. Sound Transit is retaining the purpose and need as it was published in the Draft EIS; the current purpose and need reflects public input from two scoping periods that were held prior to the Draft EIS development.

L-004-016

As described above (per Section 2.8.1 of the Draft EIS), the Link Operations and Maintenance Satellite Facility (OMSF) is a separate project that would support the Lynnwood Link Extension as well as East Link and other ongoing system growth. The separate OMSF Draft EIS published in May 2014 evaluated the impacts from alternative locations for that facility. The Final EIS for the Lynnwood Link Extension has been revised to note the opposition of the City and the School District to the site.

L-004-017

The intent of Table 2-1C was to convey design features and potential impacts for the Draft EIS alternatives, and did not attempt to speculate about possible impacts or conflicts with potential future planning efforts related to the Long-Range Plan or future development projects that have not yet been defined. Potential property impacts associated with the proposed Alternative C3 are discussed in the Draft EIS in Chapter 4 (Section 4.1 Acquisitions, Displacement, and Relocation). Table I-4.1.3 in Appendix I-4.1 Acquisitions, Displacements, and Relocations identifies five parcels that could potentially be affected by the tail track under Alternative C3.

L-004-017

designated regional growth center, which is anticipated to accommodate much of the growth between Northgate and Everett. If this growth is to be accommodated, then the impacts of eliminating the development potential of a large block of the highest density in City Center, needs to be clearly identified and mitigated.

L-004-018

10. **2.8.1 Link Operations and Maintenance Satellite Facility**: This section contains several factual errors and misstatements. The fact that analysis of the OMSF has been severed from the Lynnwood Link DEIS remains a questionable decision and tactic. ST has made it clear that ST2 cannot operate without an OMSF being built somewhere thus the projects are inextricably linked. Under Washington environmental law they would be required to be analyzed together.

11. The DEIS purports that the OMSF DEIS will be issued "in late 2013 or early 2014". We have recently been informed that due to unspecified problems the release date is being pushed back to the summer of 2014. This is particularly unfortunate since Lynnwood residents and homeowners who will be severely impacted by the OMSF will not have any certainty regarding their future for a protracted period of time. During this time they conceivably will have difficulty in selling their homes or deciding if repairs or improvements are warranted.

12. The DEIS states that "because the projects have independent utility" this DEIS does not analyze the impacts of the OMSF. The City questions how it can be concluded that the OMSF has independent utility? "But for" ST2, Lynnwood Link and other planned extensions, the OMSF would not exist. Then the text goes on to actually discuss some of the potential impacts of the OMSF in somewhat favorable terms which violates the supposed separation between the two projects while being misleading and erroneous.

13. It is noted that the OMSF would occupy parcels of land needed for the School Districts support center but then concludes that if the site is selected ST would work with the District on joint use. In fact, ST has attempted to work with the District on joint use and has been rebuffed being informed that the School District Service Center will be moving forward. Further, the DEIS fails to state that ST has no ability to exercise eminent domain over District property.

14. The text also asserts that "potential cumulative effects "of the OMSF have been analyzed in this DEIS. ST staff has repeatedly told City staff that the OMSF would need to be completed and opened well in advance of the completion of Lynnwood Link to prepare rail cars for service. The opening date for the OMSF is marketed as 2020 whereas the tracks will not be completed to Lynnwood for another three years. As such, there should be no cumulative construction impacts. If anything, there will be sequential impacts where construction

Sound Transit assessed TOD potential within station areas based on four key factors: existing conditions, transit-supportive plans and policies, station access, and potential development opportunities. Among the three Lynnwood alternatives, some minor differences were noted in the assessment. However, these differences were not significant enough to warrant a change in the overall rating and therefore ratings were similar for all alternatives.

Through coordination with the City of Lynnwood, Sound Transit developed a modification to the alignment proposed under Alternative C3. The revised alignment is a component of the Preferred Alternative, which relocates the tail tracks to run directly south of Alderwood Mall Boulevard, preserving the majority of the block east of 44th Avenue W. In Section 4.2.4 of the Final EIS, a comparison of the TOD potential will be revised to include the modified alignment. In addition to analysis of the new alignment under the Preferred Alternative, the Final EIS revisits the TOD assessment performed for the Draft EIS.

L-004-018

The decision to treat the OMSF as a project with independent utility was made by FTA in conjunction with Sound Transit, but the two projects have continued to disclose their combined impacts in cumulative effects discussions. Sound Transit recognizes the City's concerns with the Lynnwood OMSF site, but comments about that project are being addressed through that project's separate process. As such, this project has no influence over the OMSF EIS schedule; the OMSF Draft EIS was published in May 2014.

activity will go on for years. The text needs to be revised. Either all OMSF impacts should be analyzed or none should and the positions of the parties should be accurately presented.

15. **3.1.7 Parking, P. 3-16:** The DEIS offers an analysis of on-street and private parking availability proximate to the three C alignments in Lynnwood without clarifying why this exercise was undertaken or potential implications. The only conclusion we can draw is that this represents a back-door plan for ST to find ways to utilize parking outside of the transit center for commuters. This is completely unacceptable to the City. On-street parking is for the use of local residents or customers, not commuters. Similarly, privately owned parking in City Center represent a major part of the areas potential to support redevelopment consistent with City plans, State Growth Management Act and the Puget Sound Regional Council's Vision 2040. Off-site parking is completely unacceptable to the City. ST is being asked to eliminate this analysis from the DEIS and commit to the City in writing that there is no intention or plan to seek commuter parking outside of what can be accommodated within the Lynnwood Transit Center.

16. **3.2.4 Arterials and Local Streets, P. 3-37 / 3.4 Indirect and Secondary Impacts, P. 3-48 / 4.1 Acquisitions, Displacements and Relocations P. 4-3:** The majority of the southbound traffic of the to the Lynnwood ST2 terminus will come from points north on I-5 and enter the City Center at the only available southbound interchange in this area at 196th ST SW (SR 524). This access will significantly increase traffic impacts not only at that interchange and off-ramp into the City Center, but through the entire City Center street system to access the transit center. Traffic will be required to traverse local, collector and arterial streets resulting in significant impacts. This will be compounded by the large increase in bus traffic resulting from the fact that ST is projecting that 89% of the 20,000 riders each day will arrive by bus. Studying only a 0.5 mile radius is inadequate in this case. The intersections from the I-5 / 196th off-ramp to 40th Ave. W need to be studied.

17. **3.2.7 Parking, P. 3-39 / 3.6.7 Parking, P. 3-54:** It is noted that if spillover parking occurred in Lynnwood it would be onto private property (in the City Center this parking is planned for high density redevelopment to accommodate regional growth) which the City would then need to patrol locally. This spillover parking is an unacceptable result. It would damage the City's ability to achieve the goals of the City Center Plan while adding to the City's cost to patrol and manage. The text also states the amount of parking provided at each station may be further refined in future phases. The parking proposed for the Lynnwood station needs to be sized appropriately to reasonably accommodate the projected 20,000 boardings per day.

18. **3.5 Transportation Cumulative Impacts, P. 3-48:** 1) This section does not address the impact to the residential neighborhood adjacent to the OMSF with the increase in late night

L-004-019

Sound Transit generally does not support the use of on-street parking or parking in privately owned lots for transit users, although some private lot use is used by other transit agencies in the region. The parking analysis was performed to determine the current parking utilization in the area, and to see if there would be potential for hide-and-ride parking impacts. As described in the Draft EIS, if there are impacts, mitigation measures, such as adding parking zones and monitoring private lots, could be used to minimize the potential for hide-and-ride parking. Section 3.6 of the Final EIS specifically identifies the mitigation measures Sound Transit proposes to apply.

L-004-020

The analysis has been expanded to include the I-5/196th Street/Poplar Way interchange to better determine impacts.

L-004-021

Additional analysis has been performed to evaluate additional parking at the Lynnwood Transit Center Station. Long-term parking impacts are examined in Section 3.2.7 in the Draft EIS.

L-004-022

Issues related specifically to the OMSF are being addressed through that project's independent EIS review process.

L-004-022 trips from midnight - 5 am which may be disruptive to the sleeping residents. 2) Strike the references relating to the ESD plans, as this has no relation to the Lynnwood Link project (additionally it omits that the administrative building will buffer the bus fleet to the street and residents). 3) Any discussion of the OMSF in Lynnwood should also include the requirement for a second smaller OMSF facility being still required in Bellevue. It should also note that if the OMSF is built in Bellevue, no facility would be needed in Lynnwood.

L-004-023 **19. 3.6.3 Transportation - Freeway Operations, P. 3-49:** DEIS text should be corrected as follows: "or may affect ~~adjacent~~ freeway ramp operations" to "or may affect nearby primary access freeway ramp operations" or similar. The adjacent freeway ramp at I-5/44th is only a half interchange and does not provide the access from the northern boarders that the I-5/196th off-ramp will.

L-004-024 **20. Table 3-27 Transportation, Segment C Potential Mitigations, P. 3-53:** Restriping the 200th/44th intersection as proposed is not sufficient to accommodate 20,000 daily boardings at an already low functioning roadway particularly during the PM peak. Plans should study widening City Center streets to accommodate ST's projected vehicular and transit trips on 200thSt SW, 40th Ave W and 48th Ave W.

L-004-025 **21. 4.1 Acquisitions, Displacements and Relocations:** Information concerning some of the impacts of the three track alignments in Lynnwood is missing or contains errors:
(1) In all cases there is a failure to analyze the impacts of extending any of the C alternatives under ST 3 even though they are directly linked to alignment decisions made in ST2.
(2) Information concerning the impacts of C3 is erroneous. The DEIS indicates that C3 would result in the removal of one business, the La Quinta Inn hotel east of 44th Ave. This is incorrect since the tail track must impact one or two other commercial buildings west of the hotel before it can get there. This concern was raised to ST staff who indicated an error had been made in the DEIS. Apparently the hotel will not be fully taken in ST2 but a multi-story, multi-tenant commercial building would be. Clarifications and updates to all related items are necessary. The DEIS fails to analyze the potential for increased costs and impacts due to inverse condemnations of other properties in the vicinity.

22. It is evident that the La Quinta hotel would need to be taken in ST3 if C3 is selected in ST2. The hotel would also have impacts under ST2 related to the end of the tail track pointed at and close to the building. The DEIS also fails to accurately indicate impacts that would result from C3 to businesses located near I-5. Because of these errors, the true cost of C3 is misstated and likely is greater than indicated. It is not possible to accurately weigh the pros and cons of the C1/2/3 alignments without this critical information taken into account.

L-004-023

The sentence will be updated as suggested.

L-004-024

The Final EIS Chapter 3 includes updated analysis of the project's impacts related to trips to the Lynnwood Transit Center Station and park-and-ride, including the intersections of 200th with 40th Avenue W, 44th Avenue W, and 48th Avenue W. The Preferred Alternative includes street widening and intersection improvements as part of its definition, which addresses impacts previously described in the Draft EIS for all alternatives.

L-004-025

In responses above, Sound Transit has addressed the reasons why the impacts of potential future extensions are not identified in detail in the Draft EIS; the potential effects of possible ST3 projects are discussed in the Final EIS, but it remains premature to identify possible impacts to specific properties.

For the acquisitions information, the properties identified in Section 4.1 Acquisitions, Displacements and Relocation and in the related appendix are accurate; the hotel was incorrectly identified as a displacement in Section 4.2 Land Use, and this has been corrected for the Final EIS. However, the level of impacts by alternative, as well as the proposed mitigation measures, remain otherwise accurate, and the information in the Draft EIS gave an appropriate basis for public review and discussion of the alternatives under consideration. The Draft EIS notes that the parcel-level impacts are based on conceptual designs, and any properties required for the project would be covered by Sound Transit commitments to conduct property acquisition activities in accordance with state and federal law.

L-004-026

23. 4.1.5 Cumulative Impacts, P. 4-9 and Appendix H - Other Projects Considered for Cumulative Effects, P. H-3 and H-4: The Lynnwood City Center should be included in these sections. The recently approved 308 unit Lynnwood City Center Senior Living Apartments on 1.8 acres located at 19501 40th Ave. W in the City Center should also be included separately, as these are as relevant to the Lynnwood Link as both the Mountlake Terrace Senior Living Apartments and the Mountlake Terrace Town Center plan are. The Poplar Way Bridge across I-5 at 33rd Ave. W should also be included as this will impact off-ramp access and finally the 196th widening and addition of possible Bus Rapid Transit Lanes should also be included in the evaluation.

L-004-027

24. Section 4.15 Cumulative Impacts: Alternative C-3 directly impacts City of Lynnwood Wastewater Pump Station #10 and associated piping under the existing transit station parking lots. The City Center Sub-Area Plan (September, 2007) states the following: *All of the wastewater generated in the City Center Sub-Area flows to Lift Station 10, either by gravity or from force-mains associated with pump stations No. 4 and 8. Flow collected at Lift Station No. 10 is pumped to a 36-inch interceptor line via a 9,500 ft 24-inch force main, where it then gravity flows to the treatment plant. The capacity of Lift Station 10 is 6,000 gallons per minute (8.84 million gallons per day). Since existing peak hour flows exceed the capacity, modifications to Lift Station No. 10 will be required, or construction of a new lift station to bypass a portion of the flow.* There are likely impacts to the station in the existing condition, and necessary expected upgrades. At a minimum, there are likely temporary impacts during construction. The pump station was not even identified in the EIS, let alone any potential impacts analyzed. Impacts to this essential public facility must be analyzed and addressed. Further. There are odor issues associated with the lift station that would become an issue if the LRT station and bus bays were located adjacent to it as proposed. Finally, there are localized flooding issues in this area that ST appears to have overlooked.

L-004-028

25. Table 4.2-1, Locally Adopted Plans and Policies, P. 4-13: City of Lynnwood Plans should also include:

- City Center VMT & CO2 Emissions Modeling Report, January 2010;
- ULI Innovations TOD Workshop June 25, 2009 - Lynnwood Station Team Presentation;
- Extension of Light Rail to Lynnwood City Center Technical Memorandum, August 2011
- City of Lynnwood Economic Development Action Plan, 2005-2010

26. 4.2.1 Affected Environment, P. 4-18: DEIS text should be corrected as follows:
"Lynnwood's zoning regulations and design guidelines support ~~a~~ mixed use high-density ~~neighborhood~~ development in the City Center near the existing Lynnwood Transit Center, which is composed of three districts. The density ~~types of use~~ permitted varies among the districts. All Segment C station alternatives are located in the "City Center West" zone, envisioned to have a mix of high density mixed-use residential, retail, restaurants, and office~~, and high-density housing~~. The tail track of Alternative C3 would cross 44th Avenue West into the center of the large block of the higher density "City Center Core" zone, the

L-004-026

Thank you for identifying these additional projects for consideration in the cumulative effects analysis. Appendix H in the Draft EIS did include the 196th widening project, but did not include the other three projects that you mentioned. The Final EIS now reflects these projects in Appendix H.

L-004-027

Sound Transit has worked with Lynnwood staff to define the modification to Alternative C3 to address concerns about the original alternative. Those modifications are evaluated in the Final EIS, and do not conflict with the current footprint of the lift station facility. However, in response to the City's concerns, Sound Transit will coordinate further design and construction for Alternative C3 so as not to preclude or conflict with the City's ability to expand the capacity of the lift station. At this time, the City does not have detailed designs for the expansion, and initial conversations with the staff have indicated that expansion would involve equipment upgrades more than a physical expansion of the facility's footprint. However, consistent with mitigation measures described in Section 4.15.5, this coordinated approach to final design and construction would address potential conflicts.

Floodplains within the project area, and in the vicinity of Alternative C3, were discussed in Section 4.9.2 in the Draft EIS.

L-004-028

The Economic Development Plan has been added to the discussion of adopted plans and policies. The other documents are not directly related to land use plans and policies adopted by the City, so they were not added to the Final EIS. The purpose of the land use review is to identify potential conflicts with existing land use plans. The suggested edits to the text in Section 4.2.1 were made in the Final EIS. The TOD potential report did not include specific property impacts. This assessment has

L-004-028

highest density permitted in the Lynnwood Regional Growth Center and citywide." The implications of this tail track combined with the ST3 extension resulting from this alignment require further evaluation.

L-004-029

27. 4.17.1 Affected Environment, Parks;, **P. 4-220:** Scriber Creek Park, Alternative C1. It states that approximately 0.42 acre of the park would be directly affected. This is a small, pastoral park and the impact from and overhead LRT line is understated. It further states that the elevated guideway would change the experience of the parking lot. We would add that, depending on the location of the support columns, it could potentially eliminate parking spaces needed for the park. Under Alternative C2, it is states that the park is not considered noise sensitive due to higher ambient levels and its activities do not require quiet surroundings. Scriber Creek Park is a passive natural park with no active recreation facilities. Within the interior of the park street noise is negligible most of the day; park users enjoy bird watching and quiet walks through the park accompanied by the sounds of birds, frogs, etc. The park currently provides a quiet environment for these passive recreation activities. We would request that noise mitigation be provided for the park and the trail if required to achieve the existing ambient noise level.

28. 4.17.6 Potential Mitigation Measures p 4-225, Scriber Creek Park. Further research has revealed that the acquisition of the park property was funded by a grant from the Snohomish County Conservation Futures Program in 1991. The Interlocal Agreement describes the use of the "real property forever for purposes consistent with the preservation, protection and maintenance of the property for open space." In addition the Deed of Right to Use Land for Open Space Purposes states "The Grantor (City of Lynnwood) will not make or permit to be made any use of real property…. Or any part of it which is inconsistent with the right of use for public open space purposes herein granted unless such use is authorized by applicable law and the County consents to such use."

L-004-030

29. 4.18.5 Potential Impacts on Section 4(f) resources, p 4-241, The DEIS states that Scriber Creek Park is not considered a noise-sensitive resource. As a passive and natural recreational facility, noise from trains and direct construction would impact the park in ways the DEIS fails to analyze.

L-004-031

30. 4.2.2 Long Term Impacts, P.4.27: Segment C Mountlake Terrace to Lynnwood: DEIS test should be corrected as follows: "Segment C extends to the proposed Lynnwood Transit Center stations and ~~the~~ just into the far southwest corner of the City Center subarea. The proposed stations would be on the east end of the City Center West zone. This zone is envisioned to include a dense mix of commercial (office, retail, and service) uses and a concentration of mid-high density mixed-use residential units. In Alternative C3 the tail track would cross over 44th Avenue West ending in the middle of a block in City Center Core zone, which otherwise would accommodates ~~higher~~-density mixed-use development."

L-004-032

31. Alternative C2: "Alternative C2 would acquire and "convert" fewer properties than Alternative C1, and it would not convert any multifamily residential properties." It may not "convert" it has the potential to impact a multi-family apartment property with its adjacency as it runs into the Transit Center If noise mitigation is not provided.

been updated in a separate document that continues to be referenced in the Final EIS.

L-004-029

The Draft EIS noted that the elevated light rail structure above the parking lot would change the character and user experience of this area of the park, as discussed in the Scriber Creek Park evaluation in Section 4.17.2 of the Draft EIS.

The use of Conservation Futures Funds for property acquisition creates a requirement for review and approval by the original funding jurisdiction if the property is transferred for a different use. Approval of a transfer typically requires mitigation. These requirements were taken into consideration in the selection of the Preferred Alternative and the process to identify mitigation for impacts. However, as noted in several chapters of the Final EIS, Section 4(f) impacts related to the park would not allow Alternative C1 to be approved by FTA without modifying the alternative to either avoid the park or reach agreement with the City that the impacts are minor.

L-004-030

The Draft EIS discussion did address noise effects to the park on page 4-241, although it noted that FTA's definition of a noise sensitive property would not place the park as highly noise sensitive given the lack of quiet in the park today, and that park activities did not require quiet. However, for the Final EIS, the park has been identified as noise sensitive, consistent with the OMSF project Draft EIS and futher discussions with the City. Noise mitigation to be applied for nearby residences (which are noise sensitive) would also help reduce noise levels within the park. Construction activities affecting the park were noted on the same page in the Draft EIS, and the Final EIS more specifically mentions noise as one of the common types of construction period impacts.

L-004-033

32. Alternative C3: DEIS text should be corrected as follows: "Alternative C3 would acquire and convert the fewest properties to transportation use. The affected parcels would be single-family, commercial, industrial, public, and institutional properties ~~and only one existing use (La Quinta Inn) would be displaced~~. These changes in land use ~~are not expected to markedly alter land use patterns or development character~~ will significantly alter the land use of this highest density zoned block in Lynnwood's City Center and Regional Growth Center. ~~The Lynnwood Transit Center Station Options 1 and 2 have different layouts but would affect the same areas, and the land use impacts for both options would be similar~~. Both C1 and C2 station options would be compatible with area development patterns and could reinforce intensification of commercial and higher-density multifamily uses near the station. The C3 station location is remotely located away from City Center and access by pedestrians," The impacts of C3 are different as C1 and C2 do not remove development potential from the City Center Core and are more walkable distances to TOD developable properties, better supporting state, regional and local growth management plans).

L-004-034

33. 4.2.4 Indirect and Secondary Impacts, P. 4-31: The following impacts of Alternative C3 related to the Sound Transit adopted TOD policy from 2012 need to be addressed in the EIS:

- "Support implementation of state, regional and local growth plans, policies and strategies": C3 removes high density development potential with the tail track and future extension under the potential ST3.
- "Encourage convenient, safe multi-modal access to the transit system, with an emphasis on non-motorized access". C3 walking distance is furthest from developable property within City Center.
- "Support economic development efforts". C3 provides the least support for City Center TOD redevelopment. This option removes developable land within the core of the City Center which is further compounded by future impacts of ST3. C3 damages and ultimately eliminates two hotels that are critical to Lynnwood's tourism industry.

L-004-035

34. "To assess land use and economic development performance, the report considered access to regional growth centers and the station area development potential for the station areas served by each alternative. An overall rating was assigned to each station area based on its relative potential to support transit-oriented development, which was assessed by four elements:

- Existing conditions supporting transit-oriented development
- Transit-supportive plans and policies
- Station access
- Potential development opportunities"

These elements illustrate that C3 with its farthest distance from City Center high density , impacts on TOD redevelopment properties , impacts on hotel properties and walkability constraints cannot have development potential equal to the C1 or C2 options with closer their proximity to City Center and less impact from tail tracks and future impacts under ST3.

L-004-036

35. 4.2.4 Land Use Indirect and Secondary Impacts, P. 4-32 and Table 4.2-3 Summary of Station Area TOD Potential by Station Area, P. 4-33:. Arguably, TOD potential in Lynnwood is much higher than the equally ranked Mountlake Terrace options which have only a small

L-004-031

This text was revised for the Final EIS generally as suggested.

L-004-032

Sound Transit's noise mitigation commitments, described in Section 4.6, address potential noise impacts.

L-004-033

Text has been added to the Final EIS to revise the parcels that would be affected and to revise the statement regarding land use patterns and development character.

L-004-034

Sound Transit's TOD policy was considered in the development of TOD potential for the project, which was referenced in the Draft EIS. Sound Transit assessed TOD potential within station areas based on four key factors: existing conditions, transit-supportive plans and policies, station access, and potential development opportunities. Sound Transit has considered the City's comments and a comparison of TOD potential will be revised to include the modified Alternative C3. In addition to analysis of the new alignment under the Preferred Alternative, the Final EIS revisits the TOD assessment performed for the Draft EIS.

L-004-035

As noted above, the evaluation of TOD was documented in a supporting planning document and was used in the EIS primarily as a means for weighing the potential magnitude of future changes in land use if a station were built. Among the three Lynnwood alternatives, some minor differences were noted in the assessment. However, these differences were not significant enough to warrant a change in the overall rating and therefore ratings were similar for all alternatives. Sound Transit has

L-004-036

amount of developable land in close proximity and Mountlake Terrace is not a designated Regional Growth Center. We would also argue that Lynnwood's TOD potential is on par with Northgate's. Further since Northgate has already seen significant intensification long before the arrival of LRT, going forward in the timeframe of Lynnwood Link, Lynnwood City Centers potential is much higher. Within the Lynnwood Transit Center we also take exception with the equal ranking of TOD potential for all of the alignments and station locations. C1 with a station proximate to 200th and City Center clearly has the greatest potential. C2 offers decreased but still significant potential particularly if ST actively encourages redevelopment over their property. C3 has a station located in a remote and largely hidden site far removed from developable property, City Center and pedestrian access. The C3 tail track and its extension under ST3 also eliminate major potential TOD sites east of 44th Ave. C3 is focused on serving commuters rather than being supportive of TOD and meeting the goals of the City Center Plan. The City believes that in so doing C3 does not meet the criteria required under the Federal New Starts program that will be providing essential funding.

L-004-037

36. **4.2.2 Economics Impacts of Displacements on Tax Base for Cities, P. 4-41:** Revenue potential for the highest density zone in the City Center under the C3 alternative will be significantly impacted by tail track construction into middle of the block. This will be further exacerbated by the extension of the line under ST3. These impacts must be analyzed and considered.

L-004-038

37. **4.2.5 Cumulative Effects, P. 4-34:** If the OMSF is to be open by 2020 construction will not be concurrent with the Lynnwood Link Extension completed by 2023. Thus there will be no simultaneous construction activity to take advantage of. In fact, the opposite is true. Due to construction schedules the surrounding area will be impacted by construction activity for an excessively protracted period of time. The DEIS and its assumptions must be corrected.

L-004-039

38. **4.3.5 Economics Cumulative Impacts, p 4**-46: The DEIS states that the OMSF would have similar or greater multiplier effects on the regional economy as the Lynnwood Link. While we question this conclusion we note that the impacts on the local economy are much more significant. The OMSF does not offer realistic TOD benefits to Lynnwood or support for City Center development in the way Lynnwood Link can (depending upon the route alternative that is selected). The employment benefits are unlikely to accrue locally. In fact, in OMSF, as an inappropriately located heavy industrial use, creates much more significant negative cumulative impacts for the City and our residents and businesses.

L-004-040

39. **Figure 4.4-4c Social Impacts, Community Facilities Within 0.5 Mile of Light Rail Alternatives, P. 4-55:** The DEIS fails to consider significant community facilities in Lynnwood.

Cedar Valley Grange

Area of Potential Impact is described as the geographic area within which an undertaking may directly or indirectly cause alterations to the character or use of a historic property. The Cedar Valley Grange (Originally Hall Lake Grange and founded in 1909) was moved to its present location in 1948. Although the building exterior has been remodeled, it is the oldest social organization in the Lynnwood area still in existence with the early rosters

considered the City's comments as well as other design updates and the Final EIS revisits the TOD assessment performed for the Draft EIS.

L-004-036

Sound Transit has considered the comments by the City and others and has updated the text for the Final EIS to remove the incorrect reference to the hotel property. The text also now references the City's concerns about impacts to the densely zoned block. However, Sound Transit's conclusions in the EIS regarding the potential for overall land use impacts of the alternative remains similar to the characterization in the Draft EIS. Alternative C3 would not preclude all development on the block, and its other land use impacts are less than the impacts of either Alternative C1 or C2 because it avoids properties along 52nd Avenue and south of 200th Street SW.

TOD potential was one of the aspects of land use change considered in the Draft EIS, but existing uses, land use patterns, adopted plans and policies, and future planned uses are all considered. The City's comment characterizing the Alternative C3 station location as remote overstates the differences in the location of the alternatives and their proximity to other uses, as well as related benefits, but the modified Alternative C3 Sound Transit has developed in coordination with the City does place the station location closer to the city center core.

L-004-037

Section 4.3.2 of the Draft EIS evaluated the direct impacts to one business that would need to be acquired and displaced under Alternative C3. In the Final EIS, the Preferred Alternative modifies Alternative C3 by minimizing the amount of acquisition required within the triangular block east of 44th Avenue West, north of Interstate 5, and south of Alderwood Mall Boulevard. This area has been identified by the City of Lynnwood as an area planned for future high-density development. Alternative C3 Modified, designed with input from the City of Lynnwood, places the tail

L-004-040 including many of the pioneer families. It would be considered eligible for the Lynnwood Register of Historic Landmarks by age and by its exemplifying the cultural, social, or historic heritage of the City. The evaluation of buildings considered "historic" in the report focused on building structures, rather than the role which the buildings and their occupants played in the area history.

To be eligible for registration on the National Register of Historic Places (NRHP), it must meet one of four criteria including the following: "A. That are associated with events that have made a significant contribution to the broad pattern of our history…". Given the role the Grange played in the history of Alderwood Manor and later the City of Lynnwood, it should be considered eligible for the Register. Once a historic resource is identified and evaluated, Criteria of Adverse Effects are applied which include alteration of the property' setting and the introduction of visual, audible, or atmospheric elements that are out of character with the historic property.

Given its location within the 200 foot Area of Potential Impact Zone, the Cedar Valley Grange should be considered subject to an Area of Potential Effect. While the Grange building may not be directly impacted by the construction of Routes C1 and C2 with little impact created by noise and vibration, long-term effects will continue as the proposal is in operation which will impact the site's visual effects, integrity of setting, feeling and association with the surrounding community. Certainly, the OMSF, which is a heavy industrial use that would be located directly across the street from the Grange, would have a significant impact.

Interurban Railway

Although the Interurban Railway has been determined from the scope of this project not to be eligible for NHRP listing, it played a significant role in the shaping of the Alderwood Manor/City of Lynnwood community. In Part 2, Page 8-2, of the Cultural, Archaeological, and Historic Resources Technical Report, no detailed mention is made of the routing of the Interurban (though details are provided for the King County portion of the railway) and its impact on Lynnwood and the surrounding Snohomish County communities. Mention should be made that while both Routes C1 and C2 will impact the route of the railway by crossing over it, Route C3 has a major impact on the aesthetic, noise and visual aspects of the Interurban, with the line paralleling the route of the Railway for between a quarter to a half mile.

Hall's Lake

Although the Hall's Lake and the Hall's Lake Church Camp have been determined from the scope of this project not to be eligible for NHRP listing, activities associated with them played a significant role in the shaping of the Alderwood Manor/City of Lynnwood. Besides being the location of the camp, Halls Lake featured a saw mill which milled much of the timber logged during the early development of the community. Route C3 crosses a corner of the property associated with the site and one building with ties to the camp may be removed adjacent to 54th Avenue W.

track adjacent to and immediately south of Alderwood Mall Boulevard without bisecting the triangular block. The realignment of the tail track minimizes impacts to future redevelopment of parcels within this triangular block by minimizing acquisitions. The revenue potential related to future redevelopment has not been analyzed in the EIS due to the speculative nature of the size, type, and timing of future development. Any future extension of the Link light rail system north of Lynnwood could continue from the tail track section while paralleling Alderwood Mall Boulevard, also minimizing impacts to revenue potential.

L-004-038

Although the Draft EIS noted that the impacts would be higher, the Final EIS has been revised to note that the construction of the two projects could be sequential and extend the duration and severity of the impacts.

L-004-039

Section 4.3.5 of the Final EIS has been revised to state that "the Link Operations and Maintenance Satellite Facility and the larger transportation projects would have similar or greater capital construction expenditures and construction multiplier effects on the regional economy..."

Section 4.3.5 of the Draft EIS does acknowledge that the Link Operations and Maintenance Satellite Facility would also displace some of the opportunities for increased development and redevelopment potential adjacent to stations. Section 4.3.5 of the Draft EIS also acknowledges the potential loss of additional property tax revenue to the City of Lynnwood due to the construction of the Lynnwood Link Extension and the Link Operations and Maintenance Satellite Facility Project.

Increased long-term employment at the Link Operations and Maintenance Satellite Facility during operation would be quantified as

L-004-040

In summary, the construction of Routes C1, C2, and C3 will have an impact on historic resources associated with the Alderwood Manor/Lynnwood community, especially Cedar Valley Grange and the Interurban Railway route. We ask that these impacts be analyzed and mitigation proposed as appropriate. We also request that in the design for the station, consideration be given to the construction of displays that highlight the historic resources that have been impacted.

L-004-041

40. **4.4.2 Social Impacts, Long Term Impacts, page 4-59:** Segment C analysis contains previously mentioned errors regarding impacts from C3 and failure to consider ST3 extensions under any alignment.

41. **4.4.4 Social Impacts, Indirect and Secondary, P. 4-61:** The following statement conflicts with the outcome of Table 4.2.3 for TOD potential. Lynnwood's overall TOD potential should be as stated in comments above. "Construction of the light rail transit facilities could influence real-estate market forces that could increase the potential for transit-oriented development at some station locations as permitted by local zoning regulations. Such changes may be greater in the Lynnwood City Center neighborhood, where transit-oriented development potential is most likely, but most of the immediately surrounding area is characterized by commercial, light industrial, or parking uses. See Section 4.2.2 in Section 4.2, Land Use, for a discussion of long-term changes in land use. Moderate levels of redevelopment may occur in station areas in Mountlake Terrace and Shoreline." This text contradicts Lynnwood's overall TOD potential in Table 4.2-3 equaling Mountlake Terrace Transit Center Station.

L-004-042

42. **Table 4.5-1, Visual Impacts, Potential Visual Impacts, P. 4-82:** Alternative C3 in the 44th Ave W corridor is a high impact (not low to medium) to the existing commercial and planned high density mixed use that can accommodate multi-family residential growth.

43. **4.5.4 Visual Impacts, Indirect and Secondary Impacts, Page 4-89:** Landscaping is not adequate for the tail track C3 mitigation running through a high density zone to support City Center redevelopment plans including multifamily.

44. **4.5.5 Visual Impacts, Cumulative Impacts, P. 4-89, 4-90:** Add similar language as Northgate above in this section for Lynnwood City Center redevelopment plans.

45. **4.5.6 Visual Impacts, Table 4.5-2 Potential Mitigation Measures, , P. 4-93:** We note that Sound Transit is proposing establishing a landscape screen near homes located along the west side of 52nd Ave under the C1/ C2 alignment options. This is an excellent idea since landscaping proximate to the track structure is unlikely to be effective in buffering the homes due to their proximity and topography. ST should consider the potential for building earthen berms and planting coniferous trees long it to improve effectiveness. Add 200th to relocated streets (potential widening) and Landscape Screen for 44th as C1 and C2 have the tail track against boulevard, for visual impact in City Center.

part of the separate NEPA/SEPA analysis being performed for that project.

L-004-040

The Final EIS evaluates potential adverse impacts on the Cedar Valley Grange Hall and the Interurban Railway. The Cedar Valley Grange Hall was added to Figure 4.4-4C, Community Facilities Within 0.5 Mile of Light Rail Alternatives. The Hall Lake Church Camp was not evaluated because it is not an existing community facility. In order to be eligible for listing in the National Register of Historic Places, a property must meet one of several criteria and possess integrity of location, design, setting, materials, workmanship, feeling and association. The Cedar Valley Grange Hall lacks integrity of location, setting, design, materials and feeling. It has been altered with a prominent front entry addition, which changes the design, as well as replacement cladding and window sash made of modern materials. Its setting and location have also been changed. Therefore, FTA determined, and the State Historic Preservation Officer (SHPO) concurred, that it is not eligible for listing in the NRHP. The *Cultural, Archaeological, and Historic Resources Technical Report* notes that this property has an historic importance to the City of Lynnwood. Due to the local importance of the Cedar Valley Grange, Section 4.4.2 of the Final EIS was revised to evaluate potential impacts to this community facility, but concludes it will not be affected by the proposed light rail project.

The Interurban Trail is evaluated for historic significance in the Final EIS, but the analysis determined it lacks integrity of design, materials, workmanship and feeling. It is a paved bicycle and pedestrian trail that retains none of the elements of its original use, such as rails, ties, concrete abutments or other related facilities. Therefore, the trail does not convey the historic significance of the rail line. Accordingly, FTA determined, and the SHPO concurred, that the trail is not eligible for listing in the NRHP. Due to its importance in the community, Section 4.4

L-004-043

46. 4.7.3 Noise and Vibration, Alt C3 Noise Impacts, P.4-121: No analysis of the tail track turnaround noise impact on hotels and properties. Hotels adjacent may have impacts to guests staying overnight and impacts for TOD potential mixed use. A church use is identified for C1, so including analysis of these impacts for C3 would be consistent.

47. 4.7.6 Noise and Vibration, Cumulative Impacts, P. 4-124 states that "Because Sound Transit is mitigating all noise and vibration impacts (as defined by exceeding applicable FTA, state, or local criteria) created by the project, the project would not increase cumulative noise or vibration impacts, considering other current or future actions in the project area." Future actions as described here should include currently adopted City Center Sub-Area Plan within the PSRC designated Regional Growth Center to accommodate high density residential and commercial uses. C3 tail track impacts on this future action are not currently considered in the EIS and need to be.

L-004-044

48. 4.7 Noise and Vibration, Cumulative Impacts, Page 4-126: The DEIS appears to accurately portray the potential for noise impacts to homes under each of the C tack alignments. It then states that "Noise impacts could be mitigated by a 4-6' tall barrier" along the tracks. The City is seeking confirmation that these noise barriers will be designed into the project.

L-004-045

49. 4.8.1 Affected Environment: This section does not include a discussion of fauna that use the C-Segment sites, but may not be listed under ESA. Species may be impacted that have local significance, including birds and mammals (for example - river otters frequently use Scriber Creek and regional wetland). Disruption to these species would have significant emotional impact for locals who take enjoyment in viewing opportunities. This should be acknowledged and the impact assessed.

50. 4.8.2 Long Term Impacts: Impacts to Scriber Creek are understated. Scriber is definitively channelized, contrary to statements made otherwise (particularly as it relates to C-2). This area frequently experiences flooding, backing-up, and flooding of properties immediately upstream. Any activity which may impede capacity, or affect our ability to maintain the channel must be acknowledged and avoided.

51. 4.8.2 Long Term Impacts: There is no discussion of the impact of lighting and noise on the wetland affected by the C-segments. Increased light and noise directly over the Scriber Regional Wetland will impact animal use (particularly nocturnal animals – beaver and raccoons), and nesting birds. Predation of aquatic animals will increase as aquatic visibility increases. Noise and vibration may push out resident mammals (such as the river otters, or beavers) into surrounding areas.

L-004-046

52. 4.8.5 Ecosystem Resources, Cumulative Impacts, Page 4-144: states potential impacts of school district's administrative facility, and 4.15.4 on page 4-196 states the indirect and cumulative impacts of the School District facility as the same as the OMSF, please remove as

Social Impacts, Community Facilities, and Neighborhoods and Section 4.17 Parks and Recreation Resources evaluate potential adverse impacts on the Interurban Trail.

At Hall Lake, no remnant of the saw mill that was originally at this site remains. There are several small houses that may be related to the Church of the Nazarene's Hall Lake camp. However, all of these buildings have been altered and they no longer retain integrity of design, materials and workmanship. For this reason, FTA determined, and the SHPO concurred, that the buildings are not eligible for listing in the NRHP. The *Cultural, Archaeological, and Historic Resources Technical Report* notes that this property has an historic importance to the City of Lynnwood. Due to this local importance, Section 4.4.2 of the Final EIS was revised to evaluate impacts on the lake and concludes the lake will not be affected by the proposed light rail.

As discussed in Section 4.5, Sound Transit will develop design criteria for light rail stations featuring a consistent architectural theme that could include details related a community's settlement, historic resources, or nearby community facilities. Preliminary concepts for station designs will be developed with input from local jurisdictions and WSDOT, and will be vetted with the public. Sound Transit's station design standards will promote visual unity in the station areas.

L-004-041

The discussion of potential long-term impacts (Section 4.4.2) and construction impacts (Section 4.4.3) was expanded to provide more detail on impacts to parklands under each of the three Segment C alternatives.The comment indicates that the discussion of long-term impacts in Section 4.4.2 should have addressed impacts of the ST3 extension. Such impacts would not be directly related to improvements proposed for the Lynnwood Link Extension, because the ST3 extension is a separate project that is independent of improvements associated

their project is not relative to the Lynnwood Link and this is conjecture, how can ST determine that an administrative building with a bus lot, will draw the same power/ water etc. as the OMSF?

53. **4.9.1 Water Resources Affected Environment:** Scriber Creek is in the Swamp Creek Basin (Scriber is the largest tributary and contributing area in Swamp Creek), which is listed on the 303(d) list for numerous pollutants. There is an active TMDL for bacteria currently under implementation.

54. **4.5.5 Cumulative Impacts:** The statement "rainwater would be intercepted by the non-pollution-generating guideway rather than the pollution-generating roadway" thereby converting PGIS surface to NPGIS - is not accurate and should be stricken from the document.

55. **4.11.3 Construction Impacts:** It is unclear why dewatering is not anticipated nor addressed, particularly for the C Segments, given the localized high perched groundwater table, necessary crossing of a wetland, saturated peat soils, and excavation necessary for installation of water quality / quantity treatment facilities (only the shaft foundations were considered in the analysis). Dewatering will be necessary for construction in this area.

56. **4.15:** Alternative C-3 directly impacts City of Lynnwood Wastewater Pump Station #10. At the very least there would be impacts during construction, if not permanent. Mitigation / contingencies should be addressed.

57. **4.16.1 Historic Buildings and Structures:** Refer to comments above dealing with the Grange building, Interurban Railway and Halls Lake.

58. **5.1 Evaluation of Alternatives, Ability to Meet Purpose and Need, P. 5-2:** states "In the project corridor, the major urban growth centers are at Lynnwood and Northgate, which would be connected by light rail....Moreover, light rail can encourage future private development and investment near stations, which would result in economic benefits that would support the region's economic development plans."
The S.2 summary and section 5.1 are clear that included in the purposes and needs is to support redevelopment of Regional Growth Centers of which Lynnwood is the only one served by this project. The July 2013 Transportation Technical Report page 4-100 inventories existing nearby parking on generally underdeveloped private parcels located in the City Center. As mentioned earlier, Sound Transit cannot undersize their parking facility and utilize the existing spaces off premises from the transit center for its parking utilization as this runs counter to the ability to meet the purpose and need encouraging redevelopment and accommodating growth.

with the Lynnwood Link Extension. As such, discussions of these potential impacts should not be addressed in Section 4.4.2, Long-Term Impacts. However, Section 4.4.5, Cumulative Impacts, has been revised to incorporate additional discussion addressing these potential impacts. Additional discussion of potential cumulative impacts associated with the ST3 extension was also included for each of the elements of the environment discussed in Chapter 4 of the Final EIS. The comment indicates there is inconsistent discussion of potential environmental impacts in Section 4.2.4, Land Use and Section 4.4.4, Social Impacts, Community Facilities, and Neighborhoods regarding the potential for transit-oriented development to occur around the proposed transit stations. The text in Section 4.4.4 was revised to be consistent with language in Section 4.2.4 and reflect that the overall TOD potential in the Lynnwood Transit Center Station area would be strong compared to moderate to strong in the Mountlake Terrace Station area and limited for the station areas in Shoreline and north Seattle.

L-004-042

42. Table 4-5-1, Alternative C3. The City commented that the impact should be "high" for the existing commercial and planned high intensity mixed use, including multi-family. No change in the low to medium rating is proposed. The existing low visual quality rating on page 4-72 is based on the City's description of the area in the City Center Subarea Plan as "the dominant visual image is wide barren streets, enormous parking lots, signs and strip shopping centers. There is no sense of a center..." and "the general atmosphere is chaotic, congested and devoid of any character ..." The low impact rating is based on a change from the existing condition. A moderate impact rating is based on consideration of the future character of high intensity development provided for in the subarea plan and zoning. The projected intensity of development with Floor Area Ratios of 8-10 in the core and 3-5 outside of the core and building height in the core of 15 to 34 stories and 5 to 13 stories outside, will render the scale of the proposed elevated light rail system in

L-004-051

59. As the northern terminus and the only Regional Growth Center in this project, Lynnwood will accommodate the highest number of daily boardings in the Lynnwood Link Extension. In order to increase qualifications under New Starts funding criteria and meet Sound Transit's TOD policies, Sound Transit should: Provide increased analysis for C3 tail track impacts related to these purpose and need statements and New Starts funding criteria (below); and Work with the development community to implement its TOD policies consistent with New Starts objectives to accommodate shared use parking with private redevelopment, wherever possible.

L-004-052

60. Table 5-4, Evaluation of Alternatives, Comparison of Segment C Alternatives, P. 5-10: Based upon previous discussions regarding errors in property takes under the C3 alignment, the information presented in the property and total cost is erroneous and should be revised. Based upon the previous discussion on TOD potential, the information presented is erroneous and should be revised. Based upon previous discussions on ST2 alignments direct and immutable impact to Lynnwood City Center Plans and redevelopment potential, a column illustrating ST3 extension impacts on the block east of 44th Ave needs to be added.

Alternative C3 a relatively minor element within a complex and diverse urban setting.

43. Visual Impacts, Indirect and Secondary Impacts, page 4-89. The City commented that landscaping is not adequate for the tail track in Alternative C3 for mitigation of impacts to a high density zone. As indicated above, the light rail elevated system is anticipated to be just one element of a very high intensity and diverse setting. The reference to landscaping on page 4-89 is in reference to light rail stations providing a focus for mixed use development with landscaping and other visual amenities developed as an integrated part of the new developments.

44. Visual Impacts, Cumulative Impacts, pages 4-89 to 90. The City requested language similar to Northgate. Additional discussion of the intensity and scale of planned mixed use development in the Lynnwood City Center has been added to the Final EIS.

45. Visual Impacts, Potential Mitigation Measures, page 4-93. The City supports landscaping near homes along 52nd Avenue and suggest consideration of earthen berms, coniferous trees, and landscaping for 200th Street and 44th Avenue. The discussion of landscaping on pages 4-91 to 4-93 includes concepts that may be applied as designs are further developed. The text notes that it may take 15 to 20 years for plants to grow large enough to screen large facilities and 30 to 50 years to provide the same functions as existing mature vegetation.

L-004-043

46. 4.7.3 Noise and Vibration. Sound Transit analyzed the properties along the tail tracks in the Draft EIS. Although the hotel property is considered an FTA land use category 2 for noise impact analysis, the noise analysis does not indicate that there will be impacts significant enough to require specific mitigation at that location. See the Draft EIS Section 4.7.3 for the discussion on operational impacts of the project.

1

Sound Transit Lynnwood Link DEIS - City of Lynnwood Comments - Sept. 3, 2013 - Page 16 of 16

Impacts along the tail tracks are not likely due to the slow speed of the train on the trail tracks. If impacts are identified, noise walls would be considered as the primary form of mitigation.

47. 4.7.6 Noise and Vibration. See above response to comment #46 on the tail track. For permitted/approved developments with sensitive uses, Sound Transit performed an analysis as if the property were in place and considered mitigation where impacts were identified. Areas that are zoned for mixed uses but with no permitted or approved developments were evaluated based on their existing use. For the Final EIS, Sound Transit's updates included a review of permitted developments.

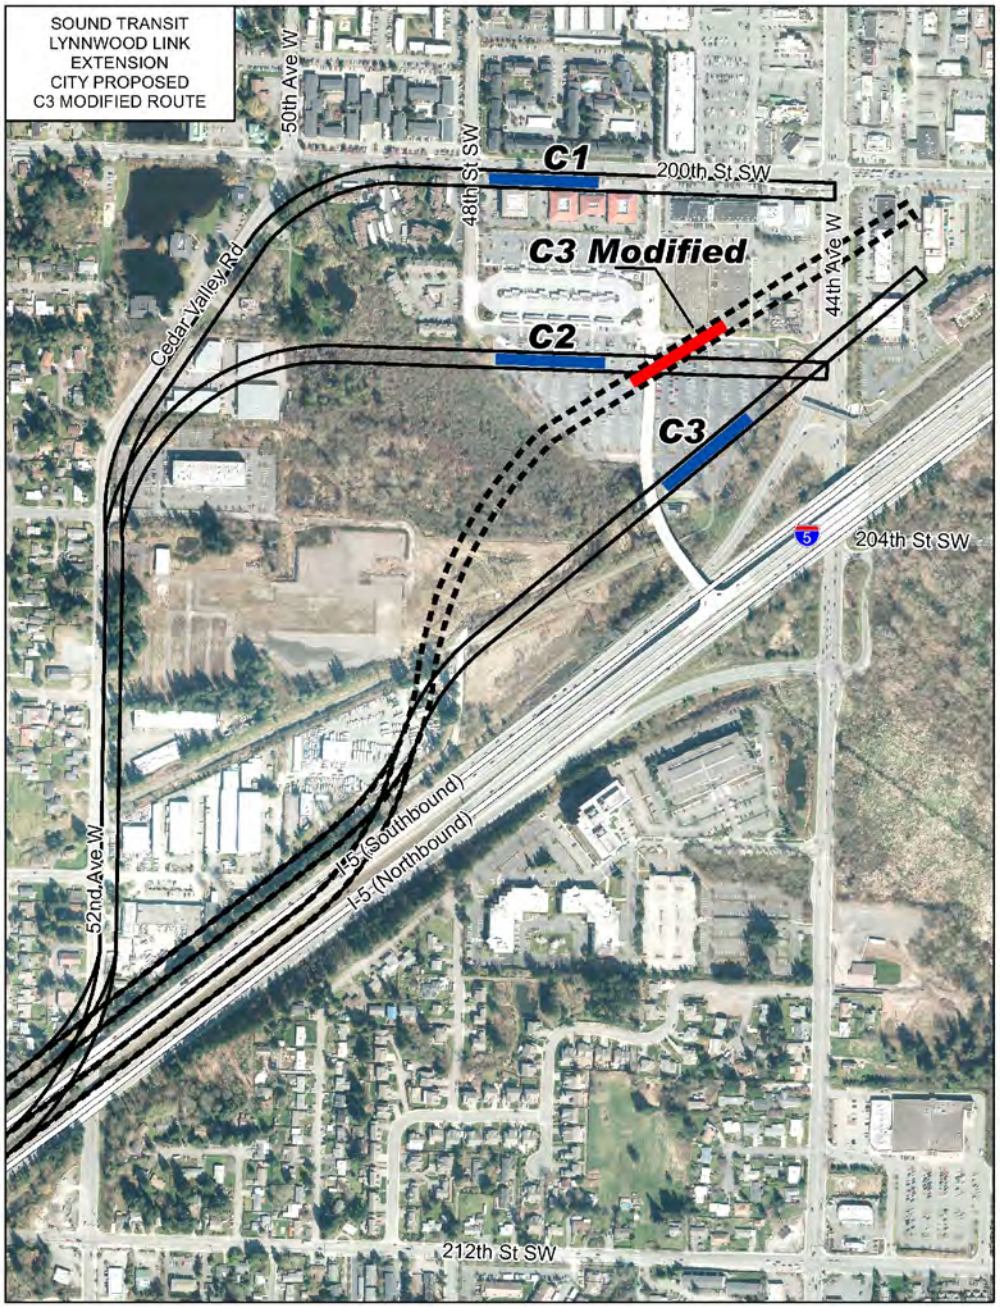
L-004-044

Any noise mitigation measures that are necessary for compliance with the FTA and Sound Transit's Mitigation Policy will be part of the Record of Decision and therefore will be included in the project when constructed.

L-004-045

49. 4.8.1 Affected Environment. The description of the affected environment has been expanded to include more information about wildlife use of the Scriber Creek wetland complex. More detailed information about vegetation and wildlife resources in the study area can be found in the Ecosystem Resources Technical Report. Potential effects related to wildlife viewing opportunities are discussed on page 4-220 of the Draft EIS, in the analysis of effects on Parks and Recreational Resources.

50. 4.8.2 Long Term Impacts. Potential impacts related to changes in the flood storage capacity of the Scriber Creek floodplain are discussed on page 4-156 of the Draft EIS, in the analysis of effects on Water Resources. Potential impacts to the stream channel will be addressed



through the various local, state, and federal permitting processes for this project. For those permits, the stream area that may be impacted by the Preferred Alternative will be identified by delineating the ordinary high water mark (OHWM) of the stream. In low-gradient streams with multiple channels (such as Scriber Creek within the wetland complex in the study area), the OHWM typically encompasses a greater area than the bankfull stream channel. In other words, impacts within the OHWM represent a conservative estimate of stream channel impacts. The impact analyses in the Final EIS reflect the results of these delineations.

51. 4.8.2 Long Term Impacts. Discussions of potential long-term impacts of lighting and noise on wildlife appear on pages 4-135 and 4-136 of the Draft EIS. The analysis in the Final EIS includes additional information about potential effects related to changes in the amounts of noise, lighting, and human activity in the study area, including the Scriber Creek wetland complex.

L-004-046

Section 4.8.5 (page 4-144) of the Draft EIS states that Sound Transit is considering a Link Operations and Maintenance Satellite Facility in the same area as the Edmonds School District master plan. It also states that one or both of these projects may include loss or degradation of vegetation, wildlife habitat, streams, wetlands, and associated buffers. The Ecosystem Resources and Utilities sections do not state that the potential impacts are the same.

L-004-047

53. 4.9.1 Water Resources Affected Environment. The scope of this study focuses only on Scriber Creek because it is located within the proposed project footprint. A brief discussion of the system downstream of Scriber Creek, which includes Swamp Creek, is included for context only. The project would not discharge within the Swamp Creek TMDLs regulated reach; therefore, discussion of its TMDL is beyond the scope

of this study.

54. 4.5.5 Cumulative Impacts (assuming comment pertains to 4.9.2 Water Resources Long-Term Impacts). The language in the Final EIS will be updated to clarify that the proposed project would result in more stormwater runoff generated by non-pollution-generating surfaces and less generated by pollution-generating surfaces compared to the existing condition.

L-004-048

Shaft foundations for Segment C will be completed using cased drilling techniques and methods for placing concrete without the need for dewatering.

Detention facilities are planned in Segment C. If possible, they will be designed to be above the water table. If this is not feasible, dewatering would be necessary for construction of these facilities. The water removed from the excavations would be handled according to the guidelines specified by Washington State Department of Ecology (Stormwater Management Manual for Western Washington).

Section 4.11.3 of the Draft EIS notes that if dewatering is required, methods to reduce settlement from dewatering could include using localized dewatering, reinjecting groundwater, using sheet piles for groundwater cutoff, or underpinning nearby structures.

L-004-049

The Final EIS discussion of impacts related to the pump station has been updated; Sound Transit appreciates the additional detail on the City's expansion plans.

L-004-050

Please see response to comment L-004-040 above.

L-004-051

Although parking is an important component of the access plan for the Lynnwood Transit Center Station, the project's ability to meet the purpose and need does not rest solely on providing parking at levels that might satisfy unconstrained demand. The project would continue to provide speed and reliability benefits to travelers, and it would also encourage higher density development in the surrounding area, which would encourage more biking and walking to reach transit. Community Transit and Sound Transit would also continue to develop and expand service in the area, which could further reduce reliance on the automobile. Sound Transit believes the Draft EIS evaluation of alternatives continued to convey the primary factors distinguishing the alternatives.

Sound Transit will be applying to FTA for New Starts funding and will comply with the August 2013 New Starts and Small Starts Evaluation Rating and Process Final Policy Guidance. Two project justification criteria are related to TOD: economic development effects and land use. Sound Transit will follow FTA's guidance to prepare and submit the required documentation. This effort is not part of the EIS process.

L-004-052

The information regarding property acquisitions in the table of the Draft EIS was accurate. The City has identified an error in Section 4.2 (Land Use) of the Draft EIS that misnamed a single property, but all of the other discussions about properties impacted, including displacements of businesses and employees, were accurate. However, the evaluation has been updated for the Final EIS to specifically note the City's concerns about impacts to the block east of 44th Avenue.

RE: Lynnwood Link DEIS, Public Comments

Dear Ms. Earl,

L-005-001

First let me again thank you for agreeing to my request that Sound Transit extend the comment period for the Lynnwood Link DEIS.

Lynnwood used the extended time to conduct extensive outreach efforts with our residents and business community. We held three forums for residents and businesses, two in June and a third on Saturday September 14th. Each of our meetings was extremely well attended. People were encouraged during the first two forums to offer their comments directly to Sound Transit and when appropriate through the DEIS website.

Also, at our regular Business Meeting on September 9, 2013, we received "open microphone" comments on ST2 and received three written submissions.

At last weekend's meeting we received a large number of comments which the City summarized on easels, as well as written statements which were submitted. We also received one follow-up email on Monday September 16, 2013, from Linda Willemarck. I am forwarding these to you to insure that they are included in the official record and considered by Sound Transit during the DEIS process.

Therefore, the following items are attached:

1. Citizen comments – Business Meeting September 9, 2013, 3 pages,
2. Sound Transit Community Outreach Meeting: Saturday, September 14, 2013 Notes Taken From Citizen Comments,10 pages,
3. Email Monday, September 16 2013, 1 page.

L-005-002

In regard to the September 16th email, we concur with Ms. Willemark's request for a more detailed review of properties in the Conservation Futures Program (CFP), and believe that the detail work will need to be accomplished by Sound Transit to appropriately complete its Environmental Impact Statement process. It would seem appropriate for Sound Transit to follow-

19100 44TH Ave W | PO Box 5008 | Lynnwood, WA 98046-5008 | Phone: 425-670-5000 | Fax: 425-670-5911 | www.ci.lynnwood.wa.us

L-005-001

Sound Transit appreciates the City's efforts to engage the community in reviewing the alternatives under consideration.

L-005-002

For the Final EIS, Sound Transit has examined the properties acquired through the Conservation Futures program. If Sound Transit were to proceed with the conversion of part of a property purchased through the program, the agency would meet the replacement requirements as part of its acquisition process.

LYNNWOOD
WASHINGTON
EXECUTIVE

L-005-002

up with the Snohomish County Conservation Futures Program in regard to property and/or title encumbrances, stipulations, and associated program limitations on the properties. Also, Sound Transit should follow-up with Snohomish County concerning prosecuting attorney legal opinions as to use of CFP properties.

Please convey my appreciation to Board member Paul Roberts, Patrice Hardy, Matt Sheldon, Michelle Ginder and others who helped support our City's outreach efforts.

Sincerely

Don Gough

Mayor, City of Lynnwood

L-005-003

Sound Transit Community Outreach Meeting: Saturday, September 14, 2013
Notes Taken From Citizen Comments

C1:

- Wetlands issue and protection of animals: why can Sound Transit disturb the wetlands if the normal citizen cannot.
- Impacts to quality of life to people, financial impacts to businesses, business relocation, park and wetland issues.
- Disturbing this land could cause geological issues
- Traffic impacts
- Home values will decrease and cause decreased tax revenues for the city.
- Getting a light rail station will be positive: some home values will increase due to proximity to the light rail / accessibility of transportation options
- Noise, vibration, aesthetics: not compatible with the neighborhood
- The park was purchased with County Conservation Funds. It is federally protected land unless development is "unavoidable" but is it really "unavoidable"?
- Destroys the neighborhood along the route
- 77 multifamily residents will be displaced and there is no plan to assist them with relocation
- Traffic increased on 200th St – this street is already impacted by traffic
- Cedar Valley Road is not an industrial area, there are professional businesses located there and it is disrupting their business: loss of parking for businesses, construction mess
- It lacks common sense due to the displacement of residents and businesses
- Not a walkability issue, people won't walk regardless of how far the station is. This option displaces people, businesses, parks, and increases noise
- Retention pond mitigation?
- Proximity to residents, construction impacts
- City should be the ones to determine the pros and cons based on City Center plans

C2:

- Park, wetlands, wildlife will experience a direct impact
- Increased crime: drug dealers, gangs
- Visual, aesthetics
- Transit increases foot traffic to small businesses
- Impact / disruption to the Interurban Trail
- Businesses impacts: displacement, loss of professional jobs (100+ employees)
- Negative impact on homes, parks, businesses, attracting visitors: loss tax revenue from displaced residents, infrastructure of the routes are impactful (pillars)
- How does the city replace the lost tax revenue from displaced residents and businesses?
- The numbers of impacted businesses in the DEIS only takes into account those that are displaced, not those that will be negatively affected by construction, loss of parking, etc.
- Curves in the route can cause wear and tear on the equipment.

L-005-003

Sound Transit appreciates the summary of comment issues raised regarding Segment C Alternatives during the City's forums; these are similar to the comments Sound Transit formally received during the scoping period. Chapter 7 of the Final EIS summarizes common comments and responses. Responses to comments from individual parties that submitted remarks to Sound Transit on the Draft EIS are provided in the Final EIS Appendix P.

Sound Transit Community Outreach Meeting: Saturday, September 14, 2013
Notes Taken From Citizen Comments

L-005-003

C3:

- This is positive because it creates a transit node
- Impacts park, wildlife, wetlands
- This option but move it a little closer to the freeway to create a multi-nodal transit center. Can you direct traffic to 208th instead of 200th?
- Would upgrades to the lift station and the retention ponds be charged to Sound Transit?
- Flooding issues are a problem
- This option is less invasive to residents
- This will help us get to Seattle faster, it is less impact to the wetlands and park, and it clumps transit together
- Sound Transit needs to research the impacts of this route more
- Seems like a funny place for the elevated line (where it crosses I-5 ramp)
- This option is too far between transit connections: you need a simple path between bus and train for the access of the riders

General Comments:

- The route should follow along I-5 and the freeway ramp
- Has C4 been researched for the impact on the neighborhood?
- How will the line continue to Everett?
- Taking the route up I-5 would miss the wetlands and not impact residents
- Can the City ask Sound Transit to specify the most stringent environmental impacts in regards to protection of the park, trees, root lines, etc.
- C4 is the best option out of the 4
- Should have the station at Alderwood with a stop at the Transit Center
- These station options aren't close to the types of businesses that you'd walk to, it should be located at Alderwood Mall
- Can we get an extension to the 60 day comment period? There are unanswered questions: EPA site visit
- Concerned about the errors in the DEIS.
- Should use the old Lynnwood High School location as the station or utilize the 'Texas T' on ramp.
- How viable is C4? It seems to be the best option
- Select a route with the least impact to residents and businesses.
- Go to Alderwood Mall, there will be less crime than if it is brought to a neighborhood.
- Additional parking at the Transit Center is needed
- Embassy Suites has had major issues in regards to the wetlands that were very costly, we need to avoid that.
- We should keep Light Rail with the Transit Center
- Should have multiple stops in Lynnwood
- Bus routes have been cut back the past few years – this won't help reduce car trips
- People will still have to drive to the station

Sound Transit Community Outreach Meeting: Saturday, September 14, 2013
Notes Taken From Citizen Comments

L-005-003

- Relocating to Alderwood Mall would negatively impact those businesses
- Developing on wetlands is not safe
- Traffic impacts on 200th St and 196th St
- All lines turn Lynnwood into an industrialized area
- Any disruption of the wetlands and Scriber Lake Park are bad
- All routes would increase crime: drug dealers, gangs
- Can we tunnel instead of raised or ground level routes?
- C3/C4 don't devastate the neighborhoods
- Why doesn't the route stay on I-5
- All routes impact low income residents and seniors as well as parks
- New routes should be created that benefit the Lynnwood community – not impact it
- All routes stand to impact the wetlands
- Mitigate traffic and amount of parking paces
- What impacts will the Lynnwood to Everett line create?
- All routes don't take into account future growth and planning: City Center, Everett extension.

This was meant to be presented as a formal speech in front of the City of Lynnwood Council.

L-005-003

I would like to thank the city council for allowing me to speak and thank everyone for showing up to support their neighbors, as well as, voice their concerns and opinions on this subject of the Lynnwood Light Rail Alignments.

That autumn evening the air was still and silent as I walked through the park like I always did time and time before. Many of the trees had turned into festive colors of greens, reds, yellows and oranges. A father and his young daughter, she must have been only 5 or 6 years old strolled ahead of me and a mysterious and sudden gust of wind blew through the trees carrying the smells of pine through the crisp air. A sudden shriek forced its way out among the tall evergreens and pines as I stopped and watched with amazement as a large gray owl emerged from the tall green trees and flew towards the child and her father, she pointed and said, "Daddy, did you see that!" with large eyes and in complete astonishment. The father seemed to look like a child himself having larger eyes than his daughter and looked amazed and stunned and said," Wow!" The owl cruised over my head and disappeared with a screech into the nearby trees behind me. At that moment I felt so incredibly blessed. I have always known that our neighborhood in Lynnwood was special almost sacred. In my almost 40 years of living and growing up in South Lynnwood this was the first time of having the experience of seeing an owl. I have heard them screeching from time to time in nearby tree lines close to our house, but never seen the nocturnal bird. How fortunate we are to live in a city were nature is so close. That is why I find it so hard to believe that the alignments C1 and C2 for the Light Rail are even being considered. These two alignments are intrusive and destructive in what I and others thought was a protected habitat and sanctuary for a vunearable ecosystem of plants and animals. We in this community as

L-005-003

well as the city have a greater responsibility to conserve and protect this habitat and sanctuary that is home for canadian geese, wood ducks, bald eagles, owls, herons, blue jays, beavers, river otters, raccoons, possum, frogs, salamanders, bats, turtles and list is really endless with so many species not to mention all the varieties of trees and vegetation that hide and protect these creatures.

I urge the City of Lynnwood Council to back the citizens that live and work in the path or near the alignments of C1 and C2. I live near both alignments and I fully support the C3 alignment because it has less of an negative impact on our primarily residential neighborhood and does not take out a large part of the park and wetlands.

I would also like to encourage everyone this autumn to tune back into nature and take a walk in the Scriber Creek Park so that you might experience a Wow! moment. This could possibly be your last opportunity to do so before it's all gone.

Thank you city council and everyone who showed up today.

Thoughts and Concerns on Sound Transit Route Alignments for the Community Outreach Meeting City of Lynnwood/Lynnwood Link Extension

Saturday, September 14th, 2013

By Mary Monaghan

L-005-003

Yes, we need light rail to Lynnwood. But at what cost to the residents who live here. It is quite obvious to me that C3 is the less intrusive and has fewer impacts to our neighborhood and to the Cedar Valley community.

It has come to my attention that the people in the Cedar Creek Condos and some of the businesses did not know of the light rail coming down 200th St. S.W. Our family has been fighting against the Operations Maintenance Satellite Facility and the light rail for a year. These people just recently found out that they are going to loose their homes and businesses if C1 is chosen as the route and they found this out by letter. We tried to let these people know a year ago and left information at the Condos with the property manager and recently found out from some residents that they never received the information. It would seem that information was allegedly being withheld on purpose and none of these people ever received anything addressed directly to them about Sound Transit until this letter came out eight weeks ago about their property.

I am deeply concerned about all of the impacts this whole project will have to our wetlands and the visual and noise impacts to our neighborhood. Please put yourselves in our place. How would you like this 40ft elevated, massive, intrusive cement jungle, across the street from your home that you have lived in for over 40 yrs, a home that you have put your heart and soul into. It seems dangerous and so out of character for this wetland neighborhood.

Both C1 and C2 would feature design measures to avoid noise impacts, but the elevated guide ways would change views and alternative C3 would have the least effect on this neighborhood because it is largely adjacent or parallel to I-5.

We on 201st Pl. S.W. by Sprague Ponds and mini park will also be impacted visually by the skyline and loss of old growth vegetation and trees in the Scriber Creek Park area along 52nd and 200th St. S.W. There is no way Sound Transit can give all of this back after the construction. These trees are old growth and a buffer to freeway and Park- and- ride noise. The light rail trains cannot have trees within 30ft of the rails. How can you expect us to embrace this massive cold and cruel cement jungle over old growth vegetation and trees and wetlands with cut throat trout, salmon spawning, turtles, dragon flies, butterflies, crickets, birds of all kinds including eagles, osprey, blue herons, wood ducks, Canadian geese, mallard ducks and river otters, raccoons, possum, musk rats, beaver, bats, salamanders, frogs and the serene sound of birds which have a calming effect rather than the stressful sounds of light rail. We had six turtles come down our street a month ago to lay eggs in the rocks in front of our house and across the street at our neighbors. How many people get to see that in their neighborhood? This is a protected wetland area labeled 4f and the sign on Scriber Creek Park sign says "Funded by in part by Conservative Futures Grant. Why would you want to put all of this wildlife in jeopardy and displace all of these animals? Why would you want something so massive going down 52nd and 200th and it will be only a block away from the so called Lynnwood City Center. Do you realize the trains will be running until 1:00 a.m. in the morning and then lined up at night on 200th and 44th waiting to be boarded again in the morning. Is this what you want

L-005-003

people to see when they come into Lynnwood? This is no way to beautify Lynnwood by making it look like the SODO district of Seattle. Keep it over by the freeway and out of our neighborhood and wetlands. Also, you could beautify your "Welcome to Lynnwood" sign a bit by putting seasonal plants and flowers in that space and do some weeding now and then. I'm sure you could even get some volunteers to help and maybe get some donations from nurseries in the area. Other towns have garden clubs that help beautify their city with hanging flower baskets like in Edmonds.

The elevated guide ways on the eastside of 52nd would visually intrude upon the integrity and unity of the residential area. We happen to live in a very special area that many people don't realize exists here in Lynnwood. It is our little paradise of wetlands all in walking distance and I don't think the City of Lynnwood appreciates what they have here. Many people from surrounding businesses such as Group Health and even City of Lynnwood employees come to visit the mini park on Sprague's Pond to have lunch and enjoy the beauty of the park and gaze across the pond over to Scriber Creek Park area. This view would drastically be altered if C1 would be chosen so you are not only altering Scriber Creek Park but also all the adjacent parks are affected. These wetlands could be turned into a wildlife preserve and bird sanctuary and bird watching area that people would come and visit and the walkways would all tie into the bus transit center. Lynnwood should embrace the beauty and resources they have now and not have it torn apart and replaced with ugly cement structures in our skyline.

Please choose C3 for this light rail project of the Lynnwood Link Extension.

RE: Lynnwood Link Extension

Dear Mayor and Individual Council Members,

L-005-003

I am so sorry I am unable to attend the Community Outreach Meeting in Council Chambers tomorrow. I did attend the one at the Grange on 6-22-2013.

Please make a strong case to Sound Transit on the DEIS that Option C3 is the only option that makes sense for our community. To try to site the route in our neighborhoods along 52nd Ave. W. (Options C1 and C2) would have the effect of destabilizing and brutally "big city industrializing" of our fragile-enough neighborhoods trying so hard to build up your city's sense of neighborhood closeness and cohesion. We don't need trains running through the delicate eco-system of what we all enjoy as Scriber Lake park, either!

Option C makes sense for consolidating and preserving a transit corridor we are already used to for Lynnwood. I believe it would indeed also be the best revenue-producing alternative for businesses, as many Lynnwood jump at the chance to find the safe harbor of hotels, restaurants, and retail options so close to their train journey's end.

Please, I count on each of you to lobby hard for what is truly best for Lynnwood, Option C3.

Sincerely, Elaine Smith

Subject: Lynnwood Link

Mayor Gough and Lynnwood City Council Members,

L-005-003

I spoke with Diane Bailey, the Administrator of the Conservation Futures Fund, and she told me that the Fund's records show the City of Lynnwood received funding for both Scriber Creek Watershed #1 and the Scriber Creek Wetlands Complex. She recommended that the City of Lynnwood check into how those monies were spent; specifically if there were Inter-local Agreements and Declarations of Protective Covenant for the properties funded with Conservation Futures, and to check on possible matching funds for these monies and any stipulations. (In addition, due to the naming conventions used in the City's, the Deis's and the Conservation Futures Fund's maps, I believe these funds may have been used to purchase other parcels of land impacted in the Lynnwood Link C Alternatives.)

Ms. Bailey also said to check the Title Report for the properties regarding any encumbrances which could have a significant impact on the use of these lands. Nancy Bartley, reporter, "The Seattle Times," interviewed David Somers, Council Member, Snohomish County Conservation Futures Program Advisory Board. It is my understanding he is getting an opinion from a Snohomish County attorney regarding the legal use of these properties. Also, a Field Visit to the potentially impacted lands is being scheduled by the EPA, with the FTA and Sound Transit.

I hope the Council ensures that all necessary information is obtained before making a final recommendation on the Lynnwood Link Alternatives on September 23, as there are many unanswered questions.

The future of a sensitive ecosystem, a large condominium community, many businesses, and the fate of a neighborhood rests with you. I believe Sound Transit will follow your lead and develop the route you recommend as it is easier to follow the path of least resistance. I also respectfully request that a motion be made by a council member for a Roll Call Vote so that citizens/voters know who agreed or disagreed with the City's recommended route to Sound Transit.

Thank you for your consideration.

Respectfully,

Linda Willemarck

L-006-001

Thank you for submitting the comments received by the City; these comments overlapped with comments Sound Transit received directly, but where they were unique, Sound Transit created a separate entry and responded directly in Appendix P of the Final EIS.

CITIZEN COMMENTS

BUSINESS MEETING

September 9, 2013

TO: Parks and Recreation Board and
TO: City Council

Below are excerpts from the 2020 Comprehensive Plan for Lynnwood that I found online. Note that the C1 and C2 routes for the Light Rail conflict with the spirit and intent of your Plan. Please choose C3 or find an alternative that does not intrude on parks, wetlands and neighborhoods.

Respectfully,

Maryellen Walsh

2020 COMPREHENSIVE PLAN - TRANSPORTATION, PAGE 1

The City's goal for the transportation system is:

To provide mobility options for residents, visitors and commuters through a balanced transportation system that supports the City's land use vision, protects neighborhoods from transportation impacts and minimizes adverse impacts on the environment.

2020 COMPREHENSIVE PLAN - TRANSPORTATION, PAGE 29

Subgoal:Environmental Factors

Minimize the impacts of the transportation system on the City's environment and neighborhood quality of life.

2020 COMPREHENSIVE PLAN - LAND USE, PAGE 21

Park/Recreation/Open Space (PRO)

Purpose: This plan category is intended to provide land area for the active and passive park and recreational needs of the city; and, to set aside areas for natural conservation.

Principal Uses: Public parks, designated open space and public recreational or educational facilities. Structures at properties in this category shall be limited to facilities needed to support the designated or planned park or open space use of the properties.

Locational Criteria: Location of these facilities will be influenced by multiple factors, including but not limited to: proximity to the population served, land availability, and amenity value of the site.

Building Design: Buildings shall be low-rise structures. Buildings in or next to residential areas shall be designed to complement residential design characteristics.

My name is Linda Willemarck. I live at 4900 200th St SW in Lynnwood. Since learning about the Sound Transit's Alternatives for the Lynnwood Link, a mere 3 months ago, I have spent a great deal of time trying to understand what properties are involved and what impacts it will have.

As you know, both the C1 and C2 Alternatives would be going down 52nd Ave West/Cedar Valley Road. In my research I found a very compelling document that really puts into perspective the importance of this area. The document reads, quote "...an established single family neighborhood containing hundreds of affordable homes and is in close proximity to several affordable housing apartments and condominium complexes, all of which would be adversely impacted by light, noise, property values, and other impacts ..."

"directly impacts hundreds of affordable homes when there are other sites available, raises social justice issues..."

"...located adjacent to significant city recreational resources of Scriber Creek and associated wetlands, and the city's Scriber Creek Park, that provide places to experience nature in close proximity to Lynnwood's City Center and regional Interurban Trail, both of which would be negatively impacted..."

"...Therefore, the City Council of the City of Lynnwood does hereby resolve and request the Sound Transit Board to remove from its potential sites and evaluations list the Lynnwood 52nd Avenue West/Cedar Valley Road site..." "

....that such site not be included in any environmental analysis, due to its many significant and unresolvable and irreparable impacts upon the City of Lynnwood, its residents and businesses and upon the Edmonds School District."

These quotes were taken from Resolution No. 2012-07 of the City of Lynnwood, Washington, regarding issues concerning the potential siting by Sound Transit. It was signed by Mayor Gough of Lynnwood on 10/22/2012.

Linda Willemarck

My name is Linda Willemarck. My address is 4900 200th St SW in Lynnwood.

If you're familiar with the Lynnwood Link C Alternatives, then you've heard of Scriber Creek Watershed #1, now known as Scriber Creek Park, as well as the Scriber Creek Wetlands Complex – paid for, at least in part, by the Conservation Futures Fund. A fund from property taxes specifically for the purpose of preserving open space, farmland or wooded acreage.

"*...to protect, preserve, maintain, improve, restore, limit the future use of, or otherwise conserve, selected open space land, farm and agricultural land, and timber land... for public use or enjoyment.* "

Tom Tiegen, Snohomish County Parks and Recreation Director said, "The acquisitions are a chance for the county to make priceless additions that will benefit "our grandchildren's grandchildren."

Conservation Futures Funding got its start in the state in 1971 under the leadership of Gov. Dan Evans. The state Legislature declared citizens had a "fundamental and inalienable right" to a healthy environment.

From "The Healing Power of Nature", Denise Mitten, PhD writes "research has shown that time in natural spaces strengthen neighborhood ties, reduces crime, stimulates social interactions among children, strengthens family connections and decreases domestic violence, assists new immigrants cope with transition, and is cost effective for health benefits.

The Park really speaks for itself.

Sound Transit DEIS
Comments c/o Lauren Swift
401 S. Jackson Street
Seattle, WA 98104

Re: Draft Environmental Impact Statement for the Lynnwood Link Extension

Dear Ms. Swift:

L-007-001

The City of Shoreline would like to take this opportunity to provide Sound Transit with our comments in response to the Draft Environmental Impact Statement for the Lynnwood Link Extension. The City appreciates the opportunities to participate in Sound Transit's planning process to date and the regular updates provided by Sound Transit staff throughout this process.

L-007-002

The City of Shoreline is excited about the extension of light rail to Shoreline in the near future. It is our City's belief that effective, fast and reliable transit service benefits our residents and the region as a whole in a variety of ways. Expanded mobility options, reduced congestion and minimizing our contribution to climate change are just a few of the benefits of a robust transit system that also mirror the goals of our Council and Shoreline's adopted plans and policies. Shoreline citizens overwhelmingly supported Sound Move and ST2.

L-007-003

The City's primary interest with the Lynnwood Link Extension is the inclusion of two light rail stations in Shoreline. In April 2012, the Shoreline City Council identified NE 145th Street and NE 185th Street as the two preferred station locations in Shoreline and sent a letter to the Sound Transit Capital Committee stating this preference. A copy of this letter is enclosed. After reviewing the DEIS and consideration of the impacts of the Lynnwood Link Extension, the City of Shoreline remains committed to this preference. We believe that with appropriate mitigation, NE 145th Street and NE 185th Street locations represent the best alternatives for Shoreline and the region and will result in the most successful project outcome for both Sound Transit and the City of Shoreline.

The alternatives considered in the DEIS identify two station pairings in Shoreline: NE 145th Street and NE 185th Street and NE 155th Street and NE

17500 Midvale Avenue North ▪ Shoreline, Washington 98133-4905
Telephone: (206) 801-2700 ▪ www.shorelinewa.gov

L-007-001

Thank you for your comments and efforts in working on the initial development of the Lynnwood Link Extension.

L-007-002

Thank you for your comment stating support for the Lynnwood Link Extension.

L-007-003

Thank you for your comment stating your station preferences and reasons for wanting stations at NE 145th and NE 185th Streets and reasons for not wanting a station at NE 155th Street. Sound Transit also appreciates the City of Shoreline's willingness to plan around the proposed stations with an emphasis on multimodal access.

L-007-003

185th Street. Shoreline believes that a station at NE 145th Street is preferable to a station at NE 155th Street for several reasons. First, a station at NE 145th Street will serve as a regional station. Due to its proximity to Bothell Way NE/Lake City Way NE (SR 522), the NE 145th Street station will act as the primary station for residents of Lake Forest Park, Kenmore, Bothell and potentially points east. Several of these jurisdictions, as well as other agencies throughout the region, have provided Sound Transit with letters of support for the NE 145th Street station. Additionally, we believe close proximity to a main thoroughfare is the most appropriate location for a regional station and NE 145th Street provides this access. Most importantly, the voter approved ST2 package included stations at NE 145th Street and NE 185th Street.

In anticipation of identification of the Preferred Alternative by the Sound Transit Board, the City of Shoreline has already begun station area planning which includes increasing density around stations to facilitate transit oriented development. A significant component of that work is the evaluation of multi-modal access to the stations, with the intent of identifying new pedestrian, bicycle and transit improvements near the stations. Additionally, the City of Shoreline is leading a multi-jurisdictional planning effort for the 145th Street corridor that will evaluate and ultimately identify the necessary improvements to the roadway for vehicles, buses and nonmotorized users. These improvements will not only help to improve multimodal access to the station, they will help facilitate transit oriented development through additional and upgraded pedestrian facilities and an improved roadway for transit connections that will allow residents to access neighborhoods beyond the light rail station. Shoreline is evaluating the potential annexation of NE 145th Street from the City of Seattle and King County and has begun discussions with these jurisdictions, subject to the designation of a light rail station at NE 145th Street in the Preferred Alternative.

We believe that a station at NE 155th Street will result in significant negative impacts to the surrounding stable, single family neighborhood. The area around the proposed station, as well as properties along the 155th Street corridor, is almost entirely single family residential. The 145th Street corridor includes a mix of multi-family residential, commercial and single family uses. Because 155th Street carries anywhere from one-quarter to one-half of the daily traffic of 145th Street, the traffic impacts associated with a station at NE 155th Street will be much more significant compared to those associated with a station at NE 145th Street. The Shoreline Fire District has a fire station on NE 155th Street located between the proposed light rail station and parking structure. They have written to Sound Transit expressing their concerns that a light rail station at NE 155th Street may negatively impact emergency response times due to the increased vehicle and bus traffic associated with the station.

The City's specific station design preferences include:

L-007-004

- NE 145th Street: Develop a station with an associated 500 space parking facility located just north of the overpass, primarily in the vegetated area between the bridge and a relocated northbound on-ramp, as shown in Alternative A3, Option 2.

L-007-005

- NE 185th Street: Develop an at-grade station on the east side of I-5 with an associated 500 space parking structure located on the west side of I-5, primarily within the I-5 right-of-way and mostly below the grade of NE 185th Street and 5th Avenue NE, as shown in Alternative A1, Option 1.

L-007-006

The City of Shoreline recommends Sound Transit construct a track alignment that is at-grade as much as possible in order to minimize cost, visual and noise impacts. All elevated sections of the alignment need to be designed in a manner that does not impede any future modifications to the interchanges at NE 145th Street, NE 175th Street and NE 205th Street.

Four of the alternatives included in the DEIS include three stations in King County while the ST2 package only anticipated two, both of which are in Shoreline. The Preferred Alternative selected by the Sound Transit Board needs to include two light rail stations in Shoreline at NE 145th Street and NE 185th Street, consistent with the voter approved ST2 plan. Should funding be available, a third station in King County is acceptable; however, the quality of the stations and passenger facilities as well as the necessary mitigation for the impacts of the stations in Shoreline should not be compromised in order to fund the third station.

L-007-007

We understand that light rail passengers will travel to the station by a variety of modes – bus, bicycle, on foot and via automobile and it will be essential to accommodate them all. It is also very important that Sound Transit integrate passenger safety, comfort and convenience into the design of all facilities and transportation improvements serving the stations.

L-007-008

Please find enclosed a list of additional comments, issues and mitigation measures from the City of Shoreline in response to the Draft Environmental Impact Statement. The City would like Sound Transit to incorporate these into the Final Environmental Impact Statement. There are several items, specifically in regard to transportation impacts, where additional information is needed in order to accurately predict potential impacts and identify the appropriate mitigation. We anticipate that staff from both of our agencies will work to reach a resolution to these outstanding issues as part of the FEIS development and will continue to do so for other issues that arise as part of the FEIS development, system and station design and through operation of service. We trust that Sound Transit will fund the mitigation that we jointly agree are

L-007-004

Thank you for your comment stating a preference for Alternative A3, Option 2 for the proposed station at NE 145th Street.

L-007-005

Thank you for your comment stating a preference for Alternative A1, Option 1 for the proposed station at NE 185th Street.

L-007-006

The City's preferences for a Segment A alternative are noted and the letter as well as a summary of the comments were given to the Sound Transit Board after the close of the comment period. The Final EIS includes supporting documentation on proposed modifications in interchange areas. The Transportation Technical Report has further details on the transportation issues in the interchange areas.

L-007-007

Sound Transit is developing the project and its stations to be easily accessible by a variety of modes, and the agency has developed design requirements emphasizing factors including safety, convenience, and comfort for patrons; as the project moves beyond preliminary engineering and into final design, Sound Transit will continue to coordinate with the City in developing station designs.

L-007-008

Sound Transit appreciates the City's review of the EIS and for its collaboration in planning the Lynnwood Link Extension. Responses to the City of Shoreline's detailed comments follow.

L-007-008

necessary to protect the community, preserve safety and provide this much needed light rail system.

Thank you for your consideration of our comments. We look forward to continuing to work with Sound Transit on this important project. If you have any questions or need additional information, feel free to contact Alicia McIntire, Senior Transportation Planner, at 206.801.2483.

Sincerely,

Keith A. McGlashan
Mayor

Enc. City of Shoreline Comments, Lynnwood Link Extension Draft Environmental Impact Statement
April 2012 Screening Alternatives Comment Letter

CITY OF SHORELINE COMMENTS
LYNNWOOD LINK EXTENSION DRAFT ENVIRONMENTAL IMPACT STATEMENT

Transportation

General

L-007-009

- For each station, there will be impacts to nearby intersections and roadways that need to be mitigated. It will be Sound Transit's responsibility to fully mitigate for all transportation impacts resulting from the proposed stations. The City of Shoreline does not agree that Sound Transit will only be responsible for paying a portion of improvements at some locations. Sound Transit is responsible for all costs associated with mitigation for transportation impacts that result in failures to meet Shoreline's adopted concurrency standards. The specific improvements will be designed in coordination with the City's Transportation Planning Manager and Traffic Engineer to ensure they meet the City's design and operational standards. The City of Shoreline is currently considering the adoption of transportation impact fees and an updated concurrency methodology. Sound Transit would be subject to these regulations should they be adopted.

L-007-010

- All roadway improvements must be consistent with the City of Shoreline's adopted roadway standards including lane width, amenity zones, sidewalk width, bicycle facilities, stormwater management (including Low Impact Development) and parking. Improvements should be designed to minimize conflicts between nonmotorized modes (bicyclists and pedestrians) and vehicles. Roadway improvements should be extended to the nearest intersecting arterial.

L-007-011

- During the City's review of the traffic model developed for this project, several errors were noted. Sound Transit needs to work with City of Shoreline staff to identify and correct these errors. Additionally, it appears that the No Build scenarios developed in the model assumed significant growth and development around the stations in Shoreline. However, if light rail stations were not going to be developed in Shoreline, the growth assumptions around these stations would be significantly different, with much less growth planned in these areas. It is critical that the traffic model be accurately calibrated and coded correctly as this will influence the base level of service and model outputs. In addition to the specific transportation mitigation identified below, the corrections to the model may identify additional issues that require mitigation. Mitigation for any newly identified impacts will be discussed and agreed upon between Sound Transit and the City of Shoreline.

- The traffic analysis needs to incorporate the anticipated growth at the Point Wells site in southwest Snohomish County. This development is expected to generate approximately 11,600 daily vehicle trips by 2035 and all of these trips will travel through Shoreline, as the sole access point to the site is in Shoreline. Residents of this development that will use light rail are likely to travel to the station at NE 185th Street. If this growth was not incorporated into Sound Transit's traffic analysis, Sound Transit will need to do so. The results of this revised analysis shall be reviewed with the City of Shoreline. Mitigation for any newly identified impacts will be discussed and agreed upon between Sound Transit and the City of Shoreline.

L-007-009

While some details of the mitigation agreements with the City will depend on final design details, the Final EIS continues to state the impact that Sound Transit's project would create compared to No Action, and it defines Sound Transit's mitigation commitment to achieve future year conditions or better than with the No Build Alternative. While Sound Transit is committed to working with the City to develop solutions that could improve conditions that would be better than under the No Build Alternative, Sound Transit does not accept sole responsiblity for making transportation system improvements at locations that would be below standards even with the No Build Alternative alone. The Final EIS (Section 3.6) includes further details for the Preferred Alternative on how impacts related to stations will be mitigated, and it also has updated the analysis at a number of locations in response to other comments from the City. This section also explains how Sound Transit will coordinate with the City as the project advances, and how Sound Transit could partner with the City to incorporate the Lynnwood Link Extension's proposed improvements and mitigations within projects that the City itself might pursue to address future transportation demands related to its own anticipated growth.

L-007-010

Section 2.6 of the Draft EIS described Sound Transit's Environmental Practices and Commitments, which are directly related to how Sound Transit's design standards, applicable local agency design standards, and permitting processes will be used as the project progresses through final design and into construction. The section notes, "Sound Transit will work collaboratively with other jurisdictions to comply with all required permits and approvals needed for construction and operation."

L-007-011

Sound Transit appreciates the comments on growth levels from the City, noting that the original Draft EIS assumptions for station area

L-007-012

- No mitigation is proposed in the DEIS for NE 175th Street and Meridian Avenue N, either for the temporary impacts associated with construction or for permanent impacts. During construction at NE 185th Street, particularly if the bridge is closed for 9-12 months, the City of Shoreline anticipates that there will be significant traffic diversion to NE 175th Street. These temporary impacts will require mitigation. Sound Transit will need to work with the City of Shoreline to identify the appropriate mitigation for construction. The City of Shoreline believes that permanent traffic impacts to this intersection and corridor can be attributed to the presence of the light rail stations and that Sound Transit is responsible for mitigating these impacts. This intersection may require turn pockets (WB to NB right turn). Other mitigation may be required at the intersection or along the corridor. Sound Transit needs to perform additional analysis of this intersection and corridor and work with the City of Shoreline to identify the appropriate mitigation for impacts to them.

- Cut-through traffic on non-arterial streets in the vicinity of the stations is likely. Measures that are designed to prevent or minimize this cut-through traffic will be required. The City of Shoreline has an adopted Neighborhood Traffic Safety Program which was created to respond to residents' concerns about speeding, cut-through traffic, accidents and pedestrian safety on non-arterial streets. Additionally, the City has developed Neighborhood Traffic Action Plans to improve the safety, mobility and livability of the City's neighborhoods. Sound Transit should contribute funding to the City's existing programs or set aside funding to work with the City of Shoreline once the stations are complete and service is in operation to identify and fund solutions for five years that reduce/mitigate cut-through traffic.

- Any impacts to the roadway network that modify streets need to maintain the existing street grid and not result in new dead end streets.

L-007-013

- Improved bus service that feeds each station will be imperative. Although the specific number of routes and frequency of service is not known at this time, the stations need to be designed to handle the maximum bus service that is forecast to serve them. Because light rail will significantly change bus service in Shoreline, a comprehensive evaluation of all transit service in the City is needed to ensure that the stations have adequate bus facilities, other facilities in the City are adequately served and that feeder service to the stations is serving all neighborhoods in Shoreline. As part of Shoreline's station area planning process this and next year, the City will prepare a Transit Integration Plan that identifies policies addressing future transit needs throughout Shoreline once light rail service begins. This process will identify levels of service and areas the City wants to see served when future service changes are implemented. This will be a coordinated process with Metro, Community Transit and Sound Transit that looks at their current policies for service distribution and redistribution of service hours in conjunction with commencement of light rail service. The expected outcome will be an agreement with Metro, Community Transit and Sound Transit on policies that will direct future transit service integration.

L-007-014

- Safety for all transportation modes is a critical aspect of facility design and development of appropriate mitigation. With the operation of light rail service, the volumes of pedestrian, bicycle, bus and vehicular traffic will increase significantly around the stations and along the roadways serving them. Many of these roadways currently serve several, if not all, of these

developments were developed in coordination with the City. For the Final EIS analysis Sound Transit met with the City to update the assumptions on growth levels. Sound Transit also updated the traffic volumes to include traffic from the proposed Point Wells development. In addition to making these localized adjustments, the forecasts were updated relative to more recent population and employment growth assumptions produced by PSRC and to reflect growth in other areas. Updated analysis of the NE 185th Street Station area and other locations, including the impacts and related mitigation, are documented in the Final EIS and the Transportation Technical Report.

L-007-012

175th at Meridian: An analysis of construction-related impacts was conducted as part of the Draft EIS and, as noted in the comments, specific mitigation was not proposed at this intersection. The Final EIS contains a refined analysis of construction-related impacts and assesses potential impacts at this intersection. The analysis of traffic impacts during the permanent configuration was also revisited for the area around the NE 185th Street Station, including the intersection of NE 175th Street/Meridian Avenue. This location was not identified for mitigation as part of the project, however.

Cut through traffic: In Chapter 3, Transportation, Section 3.6 of the Draft EIS, Sound Transit acknowledges the need to mitigate cut-through traffic and states that the mitigation would be determined in conjunction with local jurisdictions. The Final EIS Chapter 3, Section 3.6, identifies mitigation measures Sound Transit has identified to minimize the potential for cut-through traffic impacts, including neighborhood traffic control strategies that can be implemented in collaboration with the City.

L-007-013

Sound Transit agrees that effective transit connections to the stations is

L-007-014 modes. As a result of the increased volumes, the conflicts between the various modes will increase significantly. For example, buses and bicycles will experience conflicts on shared roadways if buses are able to stop in a bicycle lane. Similarly, if kiss-and-ride spaces are located adjacent to bicycle lanes, there will be conflicts between bicycles and drivers as they enter and exit this area. Sound Transit needs to work with the City of Shoreline to examine the potential for conflicts between travel modes and identify the appropriate solutions to minimize conflicts and maximize safety.

L-007-015
- The DEIS states that potential transit priority treatments along N/NE 185th Street could be considered in the Final EIS. Sound Transit should install transit priority treatments along N/NE 185th Street as well as N/NE 145th Street, N/NE 155th Street and other primary transit corridors serving the light rail stations that are identified as part of the City's Transit Integration Plan.

L-007-016
- All of the alternatives will require demolition and reconstruction of the NE 195th Street pedestrian and bicycle bridge. Design and reconstruction of the bridge shall be coordinated with the City of Shoreline and should include: a minimum width of sixteen feet (eighteen feet is preferred to provide access for emergency or maintenance vehicles); improvements to the approaches that remove the bollards and improve accessibility; provide connections to 5th Avenue NE on the west side and a connection to the school through the park (within the Interstate 5 right-of-way); improved lighting, protection for users and graffiti proof materials. The bridge may be a location where Sound Transit is able to install art.
- In areas where there is connected surplus right-of-way that cannot be utilized for redevelopment purposes, separated pedestrian and bicycle facilities (such as a path adjacent to Interstate 5) should be constructed to facilitate nonmotorized travel to the stations.

L-007-017
- A separate Transportation Impact Analysis will be required for each station in Shoreline at the time of building permit submittal.

L-007-018
- The DEIS states that column locations associated with elevated alignments may constrain sight distances and that mitigation may be required for these impacts, however, no specific mitigation is proposed. The location of any columns must comply with the City's adopted standards for site distance. Column placement will be evaluated by the City during design. Sound Transit will need to work with the City of Shoreline to identify the appropriate mitigation for sight distance impacts.

L-007-019
- The City of Shoreline requires eight foot wide sidewalks adjacent to all uses other than single family residential and in areas where high pedestrian volumes are anticipated. This will be the case for all light rail stations and many of the pedestrian improvements that will serve the stations. Sidewalks must be separated from the travel lane by an amenity zone that is at least five feet wide.

L-007-020
- The construction of any improvements along the west side of Interstate 5, including parking structures and rebuilt bridges, shall not impede the potential for future construction of a southbound Interstate 5 collector-distributor lane from NE 205th Street to NE 145th Street.

very important, and appreciates the City of Shoreline's interest in developing its own Transit Integration Plan to also consider citywide routes and services. Chapter 3 of the EIS describes the transit integration planning process that Sound Transit anticipates for the project as part of the later operational planning steps, working with King County, Community Transit, and the local jurisdictions. The City's policy statements would certainly help support that process, but the transit agencies already have established service planning steps that they must follow in making service adjustments, and levels of service also depend on available revenues for local service. Sound Transit's own service adjustment changes also have a defined process, and are made under the authority of the Sound Transit Board. Sound Transit looks forward to working collaboratively with the City and the other transit agencies during the transit integration process for the project overall, but a separate agreement with the City to direct future service planning is not consistent with the process defined for the project and used for previous projects implemented by the agency.

L-007-014

Sound Transit agrees that safe and convenient access to the stations is important. Sound Transit will work with the City during final design to develop the detailed design for the project.

L-007-015

The Draft EIS did not identify transit priority as a mitigation measure separate from other measures that could be considered to address congestion the project could cause in station areas. Transit priority continues to be noted as a supporting improvement that could be made in partnership with the City of Shoreline, King County Metro, and Community Transit, but it is not specifically part of the proposed project.

NE 145th Street Station

L-007-021

- The City of Shoreline is currently considering annexation of 145th Street and has begun conversations with Seattle and King County regarding this possibility. Should the annexation occur and the roadway be controlled entirely by the City of Shoreline, improvements on 145th Street would be subject to Shoreline adopted roadway and intersection standards and roadway mitigation will be subject to Shoreline's adopted standards.

L-007-022

- The DEIS mentions the current sidewalks on NE 145th Street, however, it fails to adequately describe their very poor condition. Sidewalks on NE 145th Street that would serve the station are substandard, do not meet ADA requirements and often contain barriers to travel, such as utility poles and mailboxes. The pedestrian environment crossing the Interstate 5 overpass is also uncomfortable, with narrow sidewalks and no buffer between pedestrians and vehicles. Other nearby streets connecting to the station are also in need of new or improved sidewalks. In order to facilitate pedestrian access to this station, Sound Transit should construct the following pedestrian improvements. These improvements are consistent with the City of Shoreline's adopted Transportation Master Plan.
  - Reconstruct sidewalks on both sides of NE 145th Street from 1st Avenue NE to 8th Avenue NE to Shoreline city standards. This is a reasonable walking zone to connect nearby residents and Lakeside school attendees along a busy and severely substandard arterial street walkway to the station at NE 145th Street.
  - Improve the pedestrian environment at the Interstate 5 interchange through wider sidewalks that are separated from the travel lanes and safer crossings. This includes the pedestrian crossing at the southbound on-ramp to Interstate 5, as the City of Shoreline does not agree with the assumption that additional traffic will not affect pedestrian safety at Lakeside High School and Middle School as stated in the DEIS.
  - Construct sidewalks on 1st Avenue NE from NE 145th Street to NE 155th Street. This is a reasonable walking distance to connect nearby residents coming from west of Interstate 5.
  - Expand the width of existing sidewalks on NE 145th Street and 5th Avenue NE to eight feet along the frontage of the station as well as at nearby bus stops and from those bus stops to the nearest intersection.
  - Additional sidewalks on non-arterial streets near the station may also be required to facilitate pedestrian movement and safety.
  - Any walkways from the parking structure to the station must be safe, comfortable and provide weather protection for pedestrians.

L-007-023

- Bus service to the station will be critical to provide an option for those who cannot or do not wish to drive in order to access light rail. The following transit improvements are needed at this station:
  - Depending upon how buses are routed to serve the station, there need to be safe facilities for riders boarding and deboarding buses and crossing streets, where necessary. This will be of particular importance if all bus stops are located on-street rather than within the station area.

L-007-016

While design details would be further developed during final design, Sound Transit will coordinate with the City and with Washington State Department of Transportation (WSDOT) for the design and reconstruction of the bridge, and will conform with the applicable standards, permits, and approvals required by the City and WSDOT. The anticipated minimum bridge width would be 14 feet, consistent with WSDOT Design Manual 1510.14(1), but a wider width could be considered. Facilities would be ADA compatible, replace existing connections, and would meet other safety and security requirements and facility design standards. Other beneficial uses would also be considered, such as providing additional replacement vegetation for areas that must be cleared for the project.

L-007-017

Sound Transit will continue to work with the City to meet permitting requirements during the project's final design and permitting stages, but believes that the EIS analysis provides a reasonable basis for determining transportation impact levels for the stations individually as well as the project overall. On other Sound Transit projects, some jurisdictions have adopted the SEPA EIS and included supplemental information for intersection operations with final design details, or added nearer term or year-of-opening traffic projections.

L-007-018

Sound Transit will minimize site distance constraints to extent possible consistent with Design Criteria manual. However, left turns from side streets or driveways under the elevated guideway would likely be restricted and rerouted to the nearest signalized intersection for left turns or U-turns. The Final EIS clarifies the previous statement on sight distances.

L-007-023

- The City supports development of a transit patron loading and unloading area that is off-street in order to minimize street crossings and maximize safety for riders, similar to what is proposed at NE 185th Street. This area needs to be adequate to provide ample space for the various routes serving it, including space for additional bus service as demand grows.
- For safety purposes, if bus stops remain on-street the eastbound bus stop at NE 145th Street and 5th Avenue NE/Interstate 5 should be far side, not near side.

L-007-024

- It is unlikely that significant bicycle improvements will be installed on 145th Street in conjunction with the station development. However, bicyclists are likely to access the station via alternate routes. N/NE 155th Street will serve as the primary east-west route for bicyclists traveling to and from the station as it currently has bicycle lanes from Midvale Avenue N to 5th Avenue NE (bicycle lanes will be extended east to 15th Avenue NE by the City in 2014). Bicyclists are likely to access N/NE 155th Street and the NE 145th Street station and the station via 5th Avenue NE, 10th Avenue NE and Meridian Avenue N. In order to facilitate bicycle access to this station, Sound Transit should construct the following bicycle improvements. These improvements are consistent with the City of Shoreline's adopted Transportation Master Plan.
  - Install bicycle lanes on 5th Avenue NE from NE 145th Street to NE 185th Street. These lanes will also serve the NE 185th Street station.
  - Install bicycle lanes on Meridian Avenue N from N 145th Street to N 200th Street. These lanes will also serve the NE 185th Street station.
  - Install sharrows on 10th Avenue NE from NE 155th Street to NE 175th Street.
  - Install wayfinding signage directing bicyclists to the station along new and existing bicycle facilities. This signage shall be consistent with the City of Shoreline's wayfinding program.
  - Install facilities along new and existing bicycle routes serving the station to minimize the conflicts between bicyclists and buses, including improvements that prevent buses from blocking bicycle lanes at stops.
- Install a separated nonmotorized trail adjacent to Interstate 5/in the Interstate 5 right-of-way from NE 145th Street to NE 155th Street.

L-007-025

- The northbound Interstate 5 on-ramp is currently identified as a High Accident Location and should be signalized for vehicles and pedestrians as suggested in the DEIS.

L-007-026

- The intersection/interchange and NE 145th Street, Interstate 5 and 5th Avenue NE is extremely complicated. The City of Shoreline has concerns about the traffic model results and potential mitigation for this area identified in the DEIS. For example:
  - Potential mitigation at NE 145th Street and 5th Avenue NE includes adding a protected right turn phase from northbound to eastbound traffic. The City of Shoreline disagrees that this mitigation will address the identified problem.
  - The City of Shoreline has concerns about the safety and operation of the garage entrance/exit onto 5th Avenue NE (Option 2).

Due to the close proximity of the existing intersections, the operation of each individual intersection can impact others. The existing signals at the interchange, in addition to those proposed, need to be evaluated as part of the entire corridor/coordinated system. This

L-007-019

Comment acknowledged. As noted previously, Sound Transit will work with the City during final design and permitting to address these detailed design questions.

L-007-020

The conceptual design for the project considers the potential for planned improvements along I-5, as outlined in the Compatibility Report described in Chapter 2, which was developed by Sound Transit and WSDOT, and which anticipates an additional two lanes to be added to I-5 in this area in the future.

L-007-021

As noted previously, Sound Transit is committed to consulting with local jurisdictions to successfully meet the conditions required to permit the project. The Final EIS provides additional detail for mitigation measures, including design refinements, for the project to resolve environmental impacts.

L-007-022

Sound Transit recognizes the City's interests in the conditions of its sidewalk system and in addressing safety concerns in its current system. As is appropriate for an EIS that is meant to identify signficant environmental impacts for a proposed action, the EIS would not include a detailed inventory of sidewalk conditions around station areas, although the Transportation Technical Report does identify gaps. A number of the areas that are noted in the City's comments are included in the refined design developed for the Preferred Alternative. However, where the project does not alter existing facilities that may have current deficiencies, particularly in areas outside the immediate station area, the EIS continues to find that the potential for increased traffic alone does not create a safety impact. Continued growth in traffic would occur with

L-007-026

evaluation should incorporate the location of the parking garage access, off-street transit facility ingress and egress points and the northbound on-ramp. Alternate locations for the parking garage ingress/egress should be examined, including a northern location that is accessed from a roadway adjacent to the on-ramp. . All improvements at this intersection/interchange need to be evaluated simultaneously for all modes to determine the appropriate mitigation at this location. Sound Transit will need to work with the City of Shoreline to identify appropriate mitigation for this intersection.

L-007-027

- The potential mitigation identified in the DEIS for NE 145th Street and 12th Avenue NE includes adding a two way left turn lane/refuge area on NE 145th Street. The City of Shoreline is concerned that this improvement will encourage drivers to use 12th Avenue NE as a cut through route, particularly when 15th Avenue NE is congested. The City of Shoreline disagrees with this proposed mitigation and recommends that it not be installed. The modeling should examine the impacts on 15th Avenue NE at NE 145th Street that this removal may cause. Additional mitigation may be required for 15th Avenue NE and Sound Transit will need to work with the City of Shoreline to identify the appropriate mitigation.

- The intersection at Meridian Avenue N and NE 145th Street is a high accident location. In order to improve safety, the intersection will need improvements in the form of northbound and southbound left turn pockets and signal phasing with protected turn movements. Left turn pockets for eastbound and westbound traffic on NE 145th Street may also be required. Sound Transit will need to work with the City of Shoreline to identify the appropriate mitigation for this intersection.

NE 185th Street Station

L-007-028

- Sidewalks already exist in much of the area around the station location. These sidewalks need to be adequate for anticipated pedestrian volumes. In order to facilitate pedestrian access to this station, Sound Transit should construct the following sidewalk improvements. These improvements are consistent with the City of Shoreline's adopted Transportation Master Plan.
  - Expand the width of existing sidewalks on NE 185th Street to eight feet along the frontage of the station, construct eight foot wide sidewalks along the transit center frontage, at nearby bus stops and from those bus stops to the nearest intersection. Construct a plaza and sidewalks along the station frontage adjacent to the transit center.
  - Construct sidewalks on NE 180th Street from 10th Avenue NE to 15th Avenue NE and 10th Avenue NE from NE 175th Street to NE 195th Street and the NE 195th Street pedestrian/bicycle bridge. This is a reasonable walking zone to connect riders coming from North City and north and east of the station.
  - Construct sidewalks on 5th Avenue NE from NE 185th Street to NE 195th Street. This will connect riders to the Interurban-Burke Gilman Trail connector, which is expected to be a major nonmotorized route to the station. It is a reasonable walking zone to connect riders coming from the north of the station.
  - Construct sidewalks on 5th Avenue NE/7th Avenue NE from NE 175th Street to NE 185th Street. This is a reasonable walking zone to connect riders coming from south of the station.

or without the project, and the City's interest in addressing safety issues, consistent with its Transportation Master Plan, would be present in any case.

L-007-023

The Final EIS and its accompanying design documents have developed further details on access features for the Preferred Alternative. However, these designs are preliminary and details would be confirmed during final design, in collaboration with the City, WSDOT, and transit providers. A near-side bus stop for eastbound buses on NE 145th Street was included in the concept design because it required one street crossing versus two, to reach the station, but again, this configuration, as with all other elements in station areas, reflects the major features that define the physical footprint and operating characteristics that form the basis of the impact analysis contained in the EIS.

L-007-024

The major features of the Preferred Alternative are described in the Final EIS, and this includes the primary access facilities for the stations. During final design, Sound Transit will coordinate with the City to explore opportunities for improving station access. Some of the specific features described in the City's comment are more detailed than the conceptual to preliminary design developed to support the EIS, and these features would be considered in coordination with the City during final design.

L-007-025

The Final EIS has further details on the proposed treatment for the on-ramp intersection. However, final decisions would follow final design, in coordination with WSDOT, the City, and other involved agencies.

L-007-028

- Additional sidewalks on non-arterial streets near the station may also be required to facilitate pedestrian movement and safety.
- Should a parking structure be located on the east side of the freeway, any walkways from the structure to the station must be safe, comfortable and provide weather protection. Should a parking lot be constructed in the Seattle City Light right-of-way, sidewalks to the station should be widened to eight feet and provide weather protection.

- The NE 185th Street bridge will need improvements for pedestrians that are safe, comfortable and provide weather protection. This may come in the form of significant improvements or reconstruction of the NE 185th Street bridge. Should the parking structure be located on the west side of the freeway, a separate pedestrian overcrossing from the parking structure across Interstate 5 to the station may be required. The bridge should provide a strong connection to the Shoreline Center. Sound Transit will need to work with the City of Shoreline to identify the appropriate design and amenities for the bridge.

- Bus service to the station will be critical to provide an option for those who cannot or do not wish to drive in order to access light rail. The following transit improvements are needed at this station:
  - The NE 185th Station is likely to serve as a transit center, with Community Transit considering termination of their Swift BRT service there. The bus facilities at this station should be off-street and need to be adequate to provide ample space for the various routes serving it, including space for additional bus service as demand grows.
  - Safe facilities for riders boarding and deboarding buses and crossing streets should also be installed.
  - Bus pullouts are needed on NE 185th Street at stops near the station to minimize conflicts with bicycles and allow traffic to pass.

L-007-029

- Bicycle safety: N/NE 185th Street currently has bicycle lanes from Midvale Avenue N to 1st Avenue NE (The bicycle lanes will be continued to 10th Avenue NE by the City in fall 2013) and will be the primary east-west bicycle route serving the station. NE 195th Street will be the secondary east-west bicycle route serving the station. Bicyclists are likely to access NE 185th Street and the station via 1st Avenue NE, 5th Avenue NE, 7th Avenue NE and NE 195th Street. Bicyclists coming from North City and east of the station are likely to travel on NE 180th Street, 10th Avenue NE and NE 185th Street. Improvements on these and other routes bicyclists will use to access the station should be installed. The conflicts between bicyclists and buses should also be minimized and buses cannot block bicycle lanes. In order to facilitate bicycle access to this station, Sound Transit should construct the following bicycle improvements. These improvements are consistent with the City of Shoreline's adopted Transportation Master Plan.
  - Install bicycle lanes on 5th Avenue NE from NE 145th Street to NE 185th Street. These lanes will also serve the NE 145th Street or NE 155th Street station.
  - Install bicycle lanes on Meridian Avenue N from N 145th Street to N 200th Street. These lanes will also serve NE 145th Street or NE 155th Street station.
  - Install bicycle lanes on 5th Avenue NE from NE 185th Street to NE 195th Street. These lanes will connect with the Interurban-Burke-Gilman Connector route on NE 195th Street.

L-007-026

Sound Transit agrees operations in this area are complex, and that final design efforts will continue to explore the best options for ensuring effective operations. The Final EIS Chapter 3, Transportation, and the Transportaton Technical Report have the results of an updated analysis of the NE 145th Street Station area using microsimulation software. This tool was also used to evaluate the effectiveness of mitigation measures described in the Final EIS.

L-007-027

Section 3.6, Potential Mitigation Measures of the Draft EIS, describes a potential measure to address the impacts at these intersections. As the Draft EIS states, Sound Transit will provide improvements as agreed to by the local jurisdiction. Sound Transit will continue coordination with the City of Shoreline to develop mitigation measures that are mutually acceptable.

L-007-028

Sidewalks: Sound Transit recognizes the City's interests in the conditions of its sidewalk system and in addressing safety concerns in its current system. As is appropriate for an EIS that is meant to identify significant environmental impacts for a proposed action, the EIS would not include a detailed inventory of sidewalk conditions around station areas, although the Transportation Technical Report does identify gaps. A number of the areas that are noted in the City's comments are included in the refined design developed for the Preferred Alternative. However, where the project does not alter existing facilities that may have current deficiencies, particularly in areas outside the immediate station area, the EIS continues to find that the potential for increased traffic alone does not create a safety impact. Continued growth in traffic would occur with or without the project, and the City's interest in addressing safety issues, consistent with its Transportation Master Plan, would be present in any case.

L-007-029

- Install bicycle lanes on 1st Avenue NE from NE 185th Street to NE 195th Street. These lanes will connect with the Interurban-Burke-Gilman Connector route on NE 195th Street.
- Install wayfinding signage directing cyclists to the station along new and existing bicycle facilities. This signage shall be consistent with the City of Shoreline's wayfinding program.
- Install facilities along new and existing bicycle routes serving the station to minimize the conflicts between bicyclists and buses or vehicles, including improvements that prevent buses from blocking bicycle lanes at stops. Kiss-and-ride facilities should not be located adjacent to bicycle facilities.

L-007-030

- The northeast corner of the intersection at NE 175th Street and 5th Avenue NE has a tight turning radius, which only the shortest Metro buses can navigate. If it is anticipated that larger buses will be utilizing this intersection to serve the station at NE 185th Street, this radius will need to be improved by Sound Transit.

- The potential improvements for 5th Avenue NE on the west side of Interstate 5 and 7th Avenue NE (5th Avenue NE on the east side) include adding a two-way left turn lane or refuge area on NE 185th Street. In addition to a turn lane/refuge area, the City of Shoreline believes a traffic signal will be needed for one or both of these intersections, depending upon the location of the parking garage, the transit center function and the realignment of 7th Avenue NE. It is likely that a signal will be needed at the transit center so that buses can exit quickly and safely. Sound Transit needs to perform additional analysis of these intersections and work with the City of Shoreline to identify the appropriate mitigation for them. Any roadway improvements will need to be in compliance with the City's road standards, including installation of bicycle and pedestrian facilities.

- Regardless of the alternative selected, the entire roadway from 1st Avenue NE to 10th Avenue NE will need to be rechannelized with a three lane cross-section and bicycle lanes to provide for continuous lanes. This will require removal of on-street parking.

- The analysis states that Meridian Avenue N and NE 185th Street will operate at LOS F in the No Build and all of the build options. The City of Shoreline believes that the No Build LOS F may be based on overestimated volume assumptions. The City assumed significant growth around the light rail stations as part of its traffic model provided to Sound Transit for analysis. However, if no light rail station is present, the assumptions would be very different for this area, with almost no growth planned in the vicinity. It appears Sound Transit's No Build alternative assumed the growth levels around light rail station areas in Shoreline would be the same with or without the light rail station. The City of Shoreline believes that the impacts to this intersection are significantly different under the No Build alternative and all options for this station. The City of Shoreline also believes that the proposed improvements of only adding protected-permissive phasing will not be sufficient to correct the level of service deficiencies and that the installation of northbound and southbound add/drop lanes is necessary to mitigate the impacts. Sound Transit needs to perform additional analysis of this intersection and work with the City of Shoreline to identify the appropriate mitigation for it for all options.

NE 185th Street Bridge: While design details would be further developed during final design, Sound Transit will coordinate the provision of acceptable non-motorized crossing facilities adjacent to or part of the 185th Street Bridge if needed to facilitate access to the station.

L-007-029

The major features of the Preferred Alternative are described in the Final EIS, and this includes the primary access facilities for the stations. During final design, Sound Transit will coordinate with the City to explore opportunities for improving station access. Some of the specific features described in the City's comment are more detailed than the conceptual to preliminary design developed to support the EIS, and these features would be considered in coordination with the City during final design.

L-007-030

As the Draft EIS states, Sound Transit will provide improvements as agreed to by the local jurisdiction. Sound Transit will continue coordination with the City of Shoreline to develop mitigation measures that are mutually acceptable.

NE 185th Street at 5th Avenue NE: No adverse impacts, but the Preferred Alternative includes some improvements in the 185th Station area.

NE 185th Street between 1st Avenue NE and 10 Avenue NE: No adverse impacts, potential coordinated improvements are possible along NE 185th Street between 1st Avenue NE and 10th Avenue NE.

NE 185th Street and Meridian Avenue N: The revised analysis shows that the Project causes a failing level of service (LOS) per local jurisdiction standards. Proposed mitigation includes adding protected-

L-007-030

- The DEIS identifies the need for improvements at 10th Avenue NE (add an eastbound right turn pocket) only with the parking lots, not parking garages. The City of Shoreline believes improvements will be needed at this intersection for all of the parking options at this station location. Sound Transit needs to perform additional analysis of this intersection and work with the City of Shoreline to identify the appropriate mitigation for it for all options.

L-007-031

- A parking structure that is located on the west side of Interstate 5 could be jointly used by the Shoreline Center, particularly visitors to the Shoreline Stadium. The potential for shared use during off-peak hours should be explored to maximize the public benefit of this facility.

NE 155th Street Station

L-007-032

As the City of Shoreline cover letter dated September 16, 2013 states, the City strongly prefers that a light rail station be located at NE 145th Street rather than NE 155th Street. The following comments outline the City of Shoreline's concerns and mitigation requirements should a station be located at NE 155th Street. These comments should not be construed as endorsement of the proposed NE 155th Street station location.

L-007-033

- The pedestrian environment around the potential station at NE 155th Street requires improvements. In order to facilitate pedestrian access to this station, Sound Transit should construct the following sidewalk improvements. These improvements are consistent with the City of Shoreline's adopted Transportation Master Plan.
  - Construct improvements to the pedestrian environment on NE 155th Street under the freeway including wider sidewalks that are separated from the travel lanes and pedestrian scale lighting.
  - Expand the width of existing sidewalks on NE 155th Street to eight feet along the frontage of the station, at nearby bus stops and from those bus stops to the nearest intersection.
  - Construct sidewalks on NE 1st Avenue NE from NE 145th Street to NE 155th Street. This is a reasonable walking zone to connect nearby residents and for riders coming the south of the station.
  - Construct/install new and improved pedestrian crossings of NE 155th Street at 1st Avenue NE and at the bus stops. Sound Transit needs to work with the City to identify the appropriate design for these crossings, which may include signalization.
  - Additional sidewalks on non-arterial streets near the station may also be required to facilitate pedestrian movement and safety.
  - Any walkways from the parking structure to the station must be safe, comfortable and provide weather protection.

L-007-034

- Bus service to the station will be critical to provide an option for those who cannot or do not wish to drive in order to access light rail. The following transit improvements are needed at this station:
  - Depending upon how buses are routed to serve the station, there need to be safe facilities for riders boarding and deboarding buses and crossing streets, where necessary. This will be of particular importance if all bus stops are located on-street rather than within the station area.

permissive phasing to the northbound and southbound left-turn movements. This improves intersection operations similar to No Build conditions.

NE 185th Street and 10th Avenue NE: The revised analysis does not identify any adverse impacts and therefore no traffic improvements or mitigation are identified at the NE 185th Street and 10th Avenue NE intersection.

L-007-031

The parking supply anticipated to be needed for the transit project has continued to be the primary consideration in the currently proposed design. For the Preferred Alternative, Sound Transit has included a design option for a joint use parking garage on Shoreline School District Property at 185th Street adjacent to the Shoreline Stadium.

L-007-032

Sound Transit acknowledges the City's preference for a station at NE 145th Street over NE 155th Street, which also was noted in the Draft EIS.

L-007-033

The alternatives featuring a NE 155th Street Station have remained in the Final EIS, but as with the Preferred Alternative, the scope of the proposed features are focused on station areas rather than on improvements needed elsewhere in the transportation system where inadequacies may currently exist. Several of the issues would involve final design details; Sound Transit will develop final design details for the project selected to be built in coordination with the City.

L-007-034

As noted above, the conceptual design elements for the alternatives with

L-007-034

- Develop a transit patron loading and unloading area that is off-street in order to minimize street crossings and maximize safety for riders, similar to what is proposed at NE 185th Street. This area needs to be adequate to provide ample space for the various routes serving it, including space for additional bus service as demand grows.
- Bus pullouts are needed on NE 155th Street at stops near the station to minimize conflicts with bicycles and allow traffic to pass.

L-007-035

- N/NE 155th Street currently has bicycle lanes from Midvale Avenue N to 5th Avenue NE (bicycle lanes will be extended east to 15th Avenue NE by the City in 2014) and will be the primary east-west bicycle route serving the station. Bicyclists are likely to access NE 155th Street and the station via 5th Avenue NE, 10th Avenue NE and Meridian Avenue N. In order to facilitate bicycle access to this station, Sound Transit should construct the following bicycle improvements. These improvements are consistent with the City of Shoreline's adopted Transportation Master Plan.
  - Install bicycle lanes on 5th Avenue NE from NE 145th Street to NE 185th Street. These lanes will also serve the NE 185th Street station.
  - Install bicycle lanes on Meridian Avenue N from N 145th Street to N 200th Street. These lanes will also serve the NE 185th Street station.
  - Install sharrows on 10th Avenue NE from NE 155th Street to NE 175th Street.
  - Install bicycle facilities on 1st Avenue NE from NE 145th Street to NE 155th Street. The City's Transportation Master Plan did not anticipate the need for bicycle facilities on this street, as it was assumed that a light rail station would be located at NE 145th Street rather than NE 155th Street. Sound Transit needs to work with the City of Shoreline to identify the appropriate bicycle facilities for this roadway.
  - Install wayfinding signage directing cyclists to the station along new and existing bicycle facilities. This signage shall be consistent with the City of Shoreline's wayfinding program.
- Install facilities along new and existing bicycle routes serving the station to minimize the conflicts between bicyclists and buses, including improvements that prevent buses from blocking bicycle lanes at stops.

L-007-036

- The City of Shoreline agrees that the eastbound right turn lane at Aurora Avenue N and N 155th Street may need to be changed to a shared through/right-turn lane as suggested in the DEIS. Sound Transit needs to perform additional analysis of this intersection and work with the City of Shoreline to identify the appropriate mitigation for it.
- Potential mitigation at NE 155th Street and 1st Avenue NE includes adding a right turn pocket. The City of Shoreline disagrees that this mitigation will address the identified problem and believes this intersection will require signalization. Sound Transit needs to perform additional analysis of this intersection and work with the City of Shoreline to identify the appropriate mitigation for it.
- Potential mitigation at NE 165th Street and 5th Avenue NE includes adding a second northbound through lane on 5th Avenue NE. The City of Shoreline disagrees that this mitigation will address the identified problem and believes this intersection may require signalization. Sound Transit

the NE 155th Street Station remain largely as discussed in the Draft EIS. As with the Preferred Alternative, Sound Transit will develop final design details for the project selected to be built in collaboration with the City, WSDOT, and transit providers. All facilities would be designed to provide safe and effective access.

L-007-035

The alternatives featuring a NE 155th Street Station have remained in the Final EIS, but as with the Preferred Alternative, the scope of the proposed features are focused on station areas rather than on improvements needed elsewhere in the transportation system where inadequacies may exist. Several of the issues would involve final design details; Sound Transit will develop final design details for the project selected to be built in coordination with the City.

L-007-036

Not affected by the Preferred Alternative. For the Final EIS discussion, options to address the impact for other light rail alternatives could include a range of measures ranging from signalization to the proposal already included in the Draft EIS. As noted in the Draft EIS, Sound Transit would provide the potential improvements discussed or other improvements as agreed to by the local jurisdiction during final design.

L-007-036 needs to perform additional analysis of this intersection and work with the City of Shoreline to identify the appropriate mitigation for it.

L-007-037
- Provide a correction in the FEIS that there is only one option remaining for paratransit and passenger pick up/drop off locations and that it is off street.

L-007-038 *Parking*

- The parking analysis evaluated utilization between 9 am and 11 am and 1 pm and 4 pm. While it is likely that cars will be parked there during those times, drivers that will park in the neighborhoods are likely to arrive earlier and leave later, when local residents still have vehicles parked on street or are returning home. Thus, Sound Transit did not evaluate the worst case scenario for parking impacts. The City of Shoreline is uncertain that the potential for spillover parking is low simply because a large garage is planned as stated in the DEIS, as this does not seem consistent with Sound Transit's experience elsewhere. The DEIS states "For parking controls agreed to with the local jurisdiction, Sound Transit would be responsible for the cost of installing the signage or other parking controls for 1 year after opening the light rail system. The local jurisdictions would be responsible for monitoring the parking controls and providing all enforcement and maintenance". The City of Shoreline does not agree with this mitigation. Sound Transit should set aside funding to work with the City of Shoreline once the stations are complete and service is in operation to identify and fund solutions that reduce/mitigate spillover parking. This may include funding the establishment and enforcement of a residential parking zone for five years. Sound Transit could also consider utilizing parking revenues to fund parking management/enforcement in Shoreline.

Land Use

L-007-039
- When describing the City of Shoreline's Comprehensive Plan Land Use Policies, the DEIS states "The land use policies would further guide land use regulations for station areas at NE 145th and NE 185th streets, including transit-supportive developments with residential components mixed with complementary commercial and office uses". Please note that the City's policies will recommend high-density residential in the station areas around NE 145th Street and NE 185th Street as part of transit-supportive developments.

- As part of its light rail station subarea planning process, the City of Shoreline will explore the creation of development regulations addressing the location of commercial/retail uses as part of parking structures. Sound Transit is subject to the City's land use regulations when developing the light rail stations and associated facilities.

Visual and Aesthetic Resources

L-007-040
- Removal of significant trees is regulated by and may be partly mitigated by replacement as prescribed in the Shoreline Municipal Code. Mitigation for the visual impacts associated with tree removal should include replacement with larger sized trees. Sound Transit should plant replacement vegetation as early as possible to help minimize visual impacts. This may include installation of replacement vegetation outside of disturbance areas prior to construction.

L-007-037

The text describing paratransit elements for the NE 155th Station has been updated for the Final EIS.

L-007-038

The parking inventory was performed during the times when the parking garages are assumed to have the highest utilization and the potential for spillover parking would be greatest. The Final EIS describes the proposed mitigation approach to address the potential for spill-over parking.

L-007-039

The Final EIS has been updated to reflect the City's most current adopted Comprehensive Plan Land Use policies.

L-007-040

Sound Transit will comply with the City of Shoreline tree replacement regulations as applicable and feasible. The City of Shoreline's comments about mitigation for loss of significant trees, including larger specimens, as well as the incorporation of public art, are consistent with the list of mitigation measures on Draft EIS pages 4-91 through 4-93, which include landscaping and elements providing visual interest. Refinement of mitigation approaches will continue through final design.

L-007-040

- It will be important to coordinate with the City regarding station design. The design must comply with the City's commercial, station area or other applicable design standards, depending on the ultimate zoning of the station sites. Other potential mitigation for visual impact would be to use 1% for art on areas that have a high visual impact and low potential for screening.

Noise and Vibration

L-007-041

- Noise walls should be relocated and/or constructed as early as possible to help minimize noise impacts associated with construction.
- Sound Transit should work with property owners both during the design and construction phases to ensure all noise and vibration impacts have been properly mitigated. Once the project is completed and service is operational, Sound Transit should continue to work with property owners to ensure all noise and vibration impacts have been mitigated.

Ecosystem Resources

L-007-042

- Mitigation for wetland impacts shall be as described in Shoreline Municipal Code, including replacement at the ratio described in the code and no net loss of function and value of wetland resources.

Water Resources

L-007-043

- Page I-4.9-7 (Appendix I) lists the stormwater design manuals for jurisdictions in which construction will occur. While these are the current requirements, the National Pollutant Discharge Elimination System Phase II permit will require all jurisdictions to adopt the 2012 Stormwater Manual or equivalent by end of 2016. The stormwater design manuals in some of the jurisdictions are likely to change with the adoption of new requirements.
- All construction and improvements must comply with the City's adopted regulations for stormwater management, including Low Impact Development.

Geology and Soils

L-007-044

- Figure I-4.11-2b does not identify peat located near Ronald Bog located at NE 175th Street and Meridian Avenue N, just west of Interstate 5. It is known that peat exists in this area, however, it is unknown the extent and/or if it extends east of Interstate 5. The area under Interstate 5 was a wetland prior to construction. Since peat is not shown where it is known to exist, soil conditions should be verified in the area east of Interstate 5 where support may be needed. Sound Transit should conduct additional borings in that area to confirm conditions.

Public Services, Safety and Security

L-007-045

- The proposed light rail station at NE 155th Street places the fire station between the light rail station and the parking facility. This location and layout will interfere with the existing Fire

L-007-041

For at-grade noise walls, it is normally the practice to install these walls early in the construction process to aid in the reduction of construction noise levels. This statement was included in the construction noise mitigation section.

Sound Transit will work with property owners during the design, construction, and operation phases of the project to ensure noise and vibration impacts are mitigated to levels below FTA impact thresholds and local criteria.

L-007-042

As noted in the Draft EIS Chapter 2, Environmental Practices and Commitments, Sound Transit will obtain permits required under local critical area codes, including those of the City of Shoreline, and will meet the permit requirements. Where major compensatory mitigation measures are known, potential sites were identified in the Draft EIS and have been refined in the Final EIS, and the anticipated standards are discussed, with details to be further confirmed during permitting phases of the project.

L-007-043

Thank you for your comment pertaining to the stormwater design manuals and the use of low-impact development (LID). Sound Transit will abide by all applicable stormwater design standards and latest approved manuals in the City of Shoreline code, as well as with the updated NPDES Phase II permit requirements. In addition, Sound Transit requires all projects to consider LID methods as a first choice for stormwater treatment (Design Criteria Manual, July 2012), and the agency will continue to review the feasibility of LID strategies as part of the project design.

L-007-045

Station just east of Interstate 5 due to increased bus, vehicle, pedestrian and bicycle traffic generated by the light rail station, thereby negatively impacting emergency response times. Depending on the specific design of the rail line itself and/or the station and the subsequent increase in traffic, the fire department may have to consider moving the facility all together. Sound Transit shall work with the Shoreline Fire Department to ensure emergency service functions and operations can continue during construction and with operation of the light rail station or relocate the fire station.

- In addition to other public safety providers, Sound Transit Police will also have jurisdiction at the light rail stations, which will influence response times. The impacts of this coordination and strategies to reduce redundancies between providers should be described in the FEIS.

- The majority of existing open-air (non-tunnel) Sound Transit stations do not have security personnel physically present as a deterrent. Many stations are monitored via camera by security personnel, who then have to report activity via phone and radio, creating ineffective prevention and response. At minimum, the physical presence of security personnel actively patrolling the facilities and buses serving the stations, combined with CCTV active monitoring, are necessary for prevention and timely reporting. Security shall be funded by Sound Transit.

- Safety and security needs to be fully integrated with design of the stations, parking structures and other facilities. Design of facilities shall be coordinated with the City of Shoreline Police Department. Safety issues that need to be addressed include:

    - Integration of Crime Prevention Through Environmental Design (CPTED) into all facilities.
    - Elevated platform emergency response requires more planning and redundant design features due to choke points inherent to mass movement to the boarding platform.
    - Sound Transit should consider developing City of Shoreline stations as closed system design, requiring pay at surface/grade level in order to enter areas for ridership flow and access to light rail vehicles.
    - Guideways will need significant passive barriers that prevent access to elevated, as well as at grade, locations not intended for rider use. Barriers should be integrated into overall security and CPTED design, as it would serve as a deterrent to theft and vandalism.

Utilities

L-007-046

- The DEIS identifies a 24-inch diameter water line crossing at NE 185th Street (this is incorrectly identified as a Shoreline Water District water line; it is a Seattle Public Utilities water line). Any modifications to or replacement of the NE 185th Street bridge must be sure not to impact this line or disrupt service to customers. This water line may need to be replaced. The City of Shoreline is in the process of acquiring the Seattle Public Utilities water utility located within the city limits and anticipates ownership will be completed by 2020. All design and construction discussions about impacts to this and other Seattle Public Utilities water utility facilities located within the City of Shoreline shall include Shoreline staff prior to and after the acquisition is complete.

L-007-044

Sound Transit is aware of the presence of peat near Ronald Bog and has conducted additional borings on the east side of I-5 to further define soil and groundwater conditions in this area. Additional work and related analysis will be conducted during final design and permitting.

L-007-045

Issue 1: Effects on fire station. Sound Transit is aware of the Fire Department's concerns about the possible impacts of a station at NE 155th Street on the operations of the fire station at that location. In the design and development of a station at that location, and the management of traffic serving the station, Sound Transit would work closely with the Fire Department to resolve any potential conflicts with bus and vehicle traffic to ensure that emergency response times would be maintained both during the construction period and operation of light rail.

Issue 2: Sound Transit Police jurisdiction. Sound Transit currently has several years of experience working in coordination with the public safety providers of local jurisdictions to ensure the safety and security of the public and to reduce redundancies. The Draft EIS discussed Sound Transit's security force, and states that final station designs will incorporate crime prevention through environmental design principles to deter criminal activity and to make station areas safer and more secure.

Issue 3: Open air stations need to have personnel actively patrolling the facilities and buses serving the stations at all times. Sound Transit now has several years of experience with safety and security across all modes, and is confident that its operating systems are appropriate to ensure the personal and physical safety of its passengers. Sound Transit is currently centralizing its video and alarm monitoring system across all modes, including vehicles and stations, and constantly reviews its operations to ensure passenger safety.

L-007-046

- As part of the City of Shoreline's acquisition of the portion of the Seattle Public Utilities water system located within Shoreline, the City is required to separate the system including installation of a new trunk line in the N/NE 145th Street right-of-way. This construction work is likely to occur from 2018-2020, at which time construction on the Lynnwood Link Extension will be underway. As design progresses for both projects, Sound Transit and the City of Shoreline will need to coordinate water line construction schedules to determine the best course of action to minimize disruption to residents and users of the corridor. Opportunities for construction efficiencies should also be explored.

Parks and Recreational Resources/4(f) and 6(f) Evaluation

L-007-047

- Construction will impact Ridgecrest Park as well as access to the park. The DEIS includes a general list of construction mitigation options and states that Sound Transit will work with jurisdictions to develop appropriate construction mitigation. As design progresses and construction plans are developed, the City will work with Sound Transit to identify mitigation to minimize construction impacts to park users and plans for restoration of disturbed areas.

- Ridgecrest Park was originally purchased by King County with Forward Thrust funding. In accordance with the requirements of Forward Thrust, any park land acquired must be replaced with like property. It will be Sound Transit's responsibility to coordinate with King County to prepare the land conversion process with like property. The conversion has to be approved by King County before the City of Shoreline can authorize purchase of the property for the Lynnwood Link Extension. Sound Transit will need to work with the City's Parks Department to identify the appropriate location and type of mitigation for this acquisition.

Construction

L-007-048

- Should the NE 185th Street bridge need to be reconstructed, the DEIS states that the roadway may need to be closed for 9-12 months. A closure of this magnitude will have significant impacts to the community. It will eliminate a major east-west access roadway and result in additional congestion at NE 175th Street, as drivers utilize this roadway as a substitute. Shoreline has a strong preference against full closure of this key arterial corridor and will require Sound Transit to develop options to avoid one, such as a temporary bridge or a half closure. The DEIS does not identify how other roadways, such as NE 175th Street, will be impacted if the NE 185th Street bridge is closed. There is no discussion of any impacts, suggested detours or mitigation. Sound Transit should explore alternative construction methods that do not require a full closure of the roadway should this bridge need to be reconstructed. Sound Transit will need to work with the City of Shoreline to identify the appropriate mitigation for these construction impacts.

- Reconstruction or improvements to the NE 185th Street bridge will need to be staggered with reconstruction of the NE 195th Street bridge so that at least one bridge is usable for bicyclists and pedestrians at all times.

- Shoreline will want to be involved in the early development of construction plans for this project. Coordination between Shoreline, Sound Transit and other agencies will include issues such as phasing and timing for various stages of construction, rerouting of bus service, impacts

Issue 4: Safety and security in design of station and other facilities. Sound Transit integrates Crime Prevention Through Environmental Design (CPTED), as included in Section 4.14.2 in the Draft EIS, in the design of all its facilities. All station platforms, including elevated platforms, are designed to accommodate emergency response and to be able to safely evacuate trains and platforms in the event of an incident. Design and security measures are used to prevent access to areas not intended for rider use.

L-007-046

Geographic Information System (GIS) data on the 24-inch-diameter water line crossing at NE 185th Street confirms that this water line is a Seattle Public Utility water line. It was incorrectly identified in the Utility Conflict Matrix as a Shoreline Water District water line and this was updated for the Final EIS. As the Draft EIS states in Section 4.15.2, Sound Transit will coordinate with the utilities to confirm and resolve potential conflicts. Sound Transit will also continue to work with utility providers to minimize any potential service interruptions (Section 4.15.5 Mitigation).

L-007-047

The Final EIS notes Sound Transit's commitment to working with the City and King County to address Forward Thrust requirements as they apply to the park, and to help the City identify appropriate property to acquire for parks use as compensatory mitigation. Potential replacement property options have been described in the Final EIS. Additional coordination with the City is reflected in the Final EIS.

L-007-048

Bullet 1 (Should the NE 185th...) With the Preferred Alternative the NE 185th Street bridge would not be rebuilt, although some access

L-007-048

to Ridgecrest Park, utility relocations including the City's waterline separation work at N/NE 145th Street, night work, truck/haul routes, detour routes, hazardous materials response planning and inspection coordination.

- The review of plans and construction management for this project will result in a significant work load for the City of Shoreline employees. Sound Transit will need to provide funding to the City to pay for additional human resources tasked with design and construction related review of the project.
- Mitigation is required to ensure that bus service is minimally interrupted during construction. Because the North Jackson Park park and ride facility at NE 145th Street and 5th Avenue NE will be used for construction staging, an alternative, temporary park and ride facility(ies) shall be sited and signed in the vicinity for routes that serve it. The existing transit only off ramps should remain in operation until light rail service begins and bus service is permanently rerouted.
- When access to properties is impacted, it should be partial only. Sound Transit shall maintain access to all properties during construction unless an alternative is mutually agreed upon by Sound Transit and the property owner. Exceptions may include short duration full closures for tasks such as paving and pouring and curing concrete.
- Noise from construction, including night work, must be mitigated to the fullest extent possible.
- Construction equipment has the potential to impact the condition of roadways that are part of haul routes. An assessment of the pavement condition for roads serving the station should be performed by Sound Transit and approved by the City before and after construction to help document any damage that occurs during construction. Damage to roadways resulting from construction activities must be repaired by Sound Transit.
- Measures should be taken during construction to avoid any short term impacts to Thornton Creek. Appropriate Best Management Practices shall be implemented and monitored during construction to avoid impacts to water quality.

modifications for pedestrians may be added; there would be no full closure. For Alternative A1, the Transportation Technical Report incorrectly stated in Table 6-1 for Alternative A1 that the bridge would be fully closed for 9-12 months. This error has been revised to indicate that one lane of the bridge would be closed in each direction for 1 month, as stated in the Draft EIS on page 3-44 and in Table 3-24.

Bullet 2 (Reconstruction or improvements...) The Draft EIS states construction of NE 185th Street would be staged or staggered (Section 3.3 page 3-43).

Bullet 3 Sound Transit will involve the City in the development and review of final design details, including construction plans.

Bullet 4 Agreements associated with the next phases of the project will be negotiated as the project moves forward.

Bullet 5 Mitigation for bus service during construction was described in section 3.6.9 of the Draft EIS (page 3-55), and more detail on the degree of mitigation for the specific stations and routes has been included in Section 3.6 of the Final EIS for the Preferred Alternative.

Bullet 6 The Draft EIS, Section 3.6.9 Arterials and Local Streets, states that *if access to the property cannot be maintained, the specific construction activity would be reviewed to determine if it could occur during non-business hours, or if the parking spaces and users of this access (for example, deliveries) could be provided at an alternative location.*

Bullet 7 (noise from construction...) Section 4.7.7 of the Draft EIS describes potential mitigation measures for construction-generated noise. Specifically, Section 4.4.7 states that noise mitigation would be implemented in order to meet local regulatory requirements, noise

The Honorable Fred Butler
Chair, Sound Transit Capital Committee
401 South Jackson Street
Seattle, WA 98104-2826

Re: Screening Alternatives for the North Corridor Transit Project

Dear Chair Butler:

The City of Shoreline looks forward to the extension of light rail north and is excited for new transit service for our residents and the region. As Sound Transit is currently considering station locations and alignment for the Lynnwood Extension project to be considered in the Draft Environmental Impact Statement, the Shoreline City Council would like to provide our input in this critical process.

The City Council has reviewed the potential station locations and route alignment and has determined that the best fit for our community and the success of the project overall is to place stations at 145th Street and 185th Street, with alignment on the east side of I-5.

We believe that these station locations provide the greatest opportunities for redevelopment around the station areas, minimize traffic impacts in neighborhoods, are the most readily accessible and can best be served by transit. To prepare for these future stations, Council is developing framework policies for adoption in May to guide station area planning that will allow for future transit oriented development around the stations. The Council is committed to working with our community to plan for new residential and commercial opportunities.

We are concerned about the inclusion of a potential station at 155th Street in Shoreline. When applying our draft framework policies to the possible station locations in conjunction with consideration of the existing surrounding land uses, NE 145th Street shows significantly greater potential for transit oriented development. Its proximity to the commercial node at 15th Avenue NE, Aurora Avenue N, Lakeside School and multi-family development along the 145th Street corridor strengthen future opportunities for successful redevelopment that complements and focuses on the use of transit as a primary transportation mode.

We understand that the evaluation of a station at NE 125th Street or NE 130th Street will be performed as a pairing with a station at NE 155th Street and these two stations would serve as a substitute for a station at NE 145th Street. We

17500 Midvale Avenue North ◆ Shoreline, Washington 98133-4905
Telephone: (206) 801-2700 ◆ www.shorelinewa.gov

ordinances, and permit and variance conditions.

Bullet 8 (Construction equipment..) Sound Transit will repair any public rights-of-way at Sound Transit work sites that are damaged during construction to substantially the same condition.

Bullet 9 Sound Transit recognizes the importance of Thornton Creek, and the project will abide by all applicable federal, state, and local environmental laws and regulations. Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts on environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure no net loss of ecosystem function and acreage as a result of agency projects. The Lynnwood Link Extension would mitigate impacts on ecosystem resources in accordance with the mitigation sequencing requirements established by NEPA, the Clean Water Act, and local critical areas ordinances.

L-007-049

Thank you for enclosing the City's earlier letter to Sound Transit expressing its views on the range of alternatives the Sound Transit Board was considering for the Draft EIS. Because this letter predates the Draft EIS, no detailed responses are provided here.

L-007-049

understand that the rationale provided for pairing these stations, rather than considering NE 145th Street instead of NE 155th Street is the need to maintain stop spacing of no less than one mile. It is Shoreline's contention that each of these stations needs to be evaluated on its own merits so that they can be fairly compared to one another.

Additionally, the inclusion of a fifth station in the North Corridor Transit project was not anticipated as part of the voter approved ST2 funding package. Should an additional station be approved at NE 125th Street/NE 130th Street, we want Sound Transit to ensure that its design and construction is adequately funded and will not result in the reduction or elimination of facilities, amenities or mitigation at the remaining two stations in the North King subarea.

Finally, the ST2 conceptual alignment includes parking garages at both stations with 500 parking stalls each. The City understands the need for parking facilities at the stations and would like Sound Transit to include evaluation of parking needs as part of the DEIS. As part of this evaluation, we are requesting that Sound Transit examine options that include both a single parking structure for each station and concepts that include multiple, smaller structures. It is the City's belief that while parking is needed, there may be a time in the future where less parking is needed, as riders utilize transit or non-motorized options to access the stations. In those circumstances, the garages may be converted to new uses or provide parking for new developments near the stations. By having parking garages at the two Shoreline stations, Sound Transit would be improving transit access to the region.

Thank you for your consideration of our comments. We look forward to continuing to work with Sound Transit and our neighbors on this important project. If you have any questions or need additional information, feel free to contact Alicia McIntire, Senior Transportation Planner, at 206.801.2483.

Sincerely,

Keith A. McGlashan

September 12, 2013

Dear Sound Transit Board:

Thanks for the opportunity to comment on the Draft Environmental Impact Statement (DEIS) for the Lynnwood Link Extension. We appreciate the excellent work and countless hours that has gone into issuing this document.

Our City Council has long been an advocate for light rail for our region. Accordingly, we began planning for transit-oriented development in key areas of our community more than ten years ago. Our focus has been greatest in revitalizing our downtown/Town Center, which is near 236th Street SW, just east of I-5, as well as in developing the commercial/mixed use area immediately south of 236th and also just east of I-5. The latter area includes about 12 acres of vacant land in two parcels, which we have zoned for compact development up to 20 stories. In addition, we have adopted Comprehensive Plan and zoning changes to allow compact, mixed-use development along 220th Street SW, just west of I-5. This area includes about six acres of undeveloped property owned by the Edmonds School District.

L-008-001 We like Alternative B1 for its location of a station at 236th Street SW, close to the Town Center and Freeway/Tourist District. However, it does not support transit oriented development at 220th Street SW, where extensive development is possible.

L-008-002 We ask that you select Alternative B2 or B2A as the Preferred Alternative for rail alignment and station locations that will be included in the Final Environmental Impact Statement. Both alternatives, as with Alternative B1, support a station just east of I-5 at 236th. As with Alternative B1, this station location would provide the greatest opportunity for transit-oriented development and would support our community's Town Center vision. In addition, Alternative B2 has the light rail line crossing from the east side of I-5 to the west side (where at some point it needs to be located anyway to accommodate the Lynnwood connection) in a way that makes it possible for a station to be added at 220th in the future. Alternative B2A is the same as B2 except that it includes actually building the station at 220th.

L-008-003 The alternative we do not favor as the Preferred Alternative is Alternative B4. It provides light rail mostly in the freeway median and would have at least 1,000 less riders daily than any of the other three alternatives for the B section of Lynnwood Link. This is the least supportive of transit-oriented development and downtown revitalization.

We look forward to continuing our partnership and seeing light rail constructed in Snohomish County to attract the greatest ridership possible.

Regards,

Jerry Smith, Mayor

cc: Mountlake Terrace City Council
Scott Hugill, Interim City Manager
Shane Hope, Community and Economic Development Director

L-008-001

Thank you for your observations on Alternative B1.

L-008-002

Thank you for stating your preference for Alternative B2 or B2A. A modified version of Alternative B2 is part of the Preferred Alternative. The modification shifts the alignment west to avoid impacts to the I-5 ramps. The Final EIS also includes an optional station south of 220th Street SW and a 200-car surface parking lot on the site of the former Melody High School.

L-008-003

Thank you for your comment stating your objections to Alternative B4.

Sound Transit DEIS
Comments c/o Lauren Swift
401 S. Jackson Street
Seattle, WA 98104

LynnwoodLinkDEIS@soundtransit.org

Dear Sound Transit Board,

Thank for the opportunity to comment on the Draft Environmental Impact Statement for the Lynnwood Link Extension. I appreciate the numerous occasions for input into the process.

After reviewing all of the alternatives, I have the following feedback for your consideration.

L-009-001

1. Select Alternative B2, putting the Transit Center stop to the east of the current Mountlake Terrace Transit Station.

L-009-002

2. I prefer Alternative B2 or B2A with the alignment going across 220th to the west of the freeway with a possible future transit stop at 220th.

L-009-003

3. Approve the City of Lynnwood's C3 Modified Alternative to be incorporated as part of the Final EIS for the Lynnwood Link Extension. Because of the extensive impact this alternative has for Edmonds School District and its planned use of this property for a Maintenance and Transportation facility, I ask that the District be invited to be a participant in the engineering and planning process of this alternative.

As stated in Section 4.1.2, Long Term Impacts, Segment C, Sound Transit will need to mitigate the impacts to our planned use for this property. The effected facility will most likely be in operation during the construction phase of the C3 Modified Alternative as well as when the link extension is operational.

I look forward to continuing to work with the staff of Sound Transit as they move closer to seeing the much needed Lynnwood Link Extension become a reality.

Sincerely,

Stewart Mhyre

L-009-001

Thank you for stating a preference for Alternative B2 and a possible future transit station at 220th Street SW. A modified version of Alternative B2 is part of the Preferred Alternative. The modification shifts the alignment west to avoid impacts to the I-5 ramps. The Final EIS also includes an optional station south of 220th Street SW and a 200-car surface parking lot on the site of the former Melody High School.

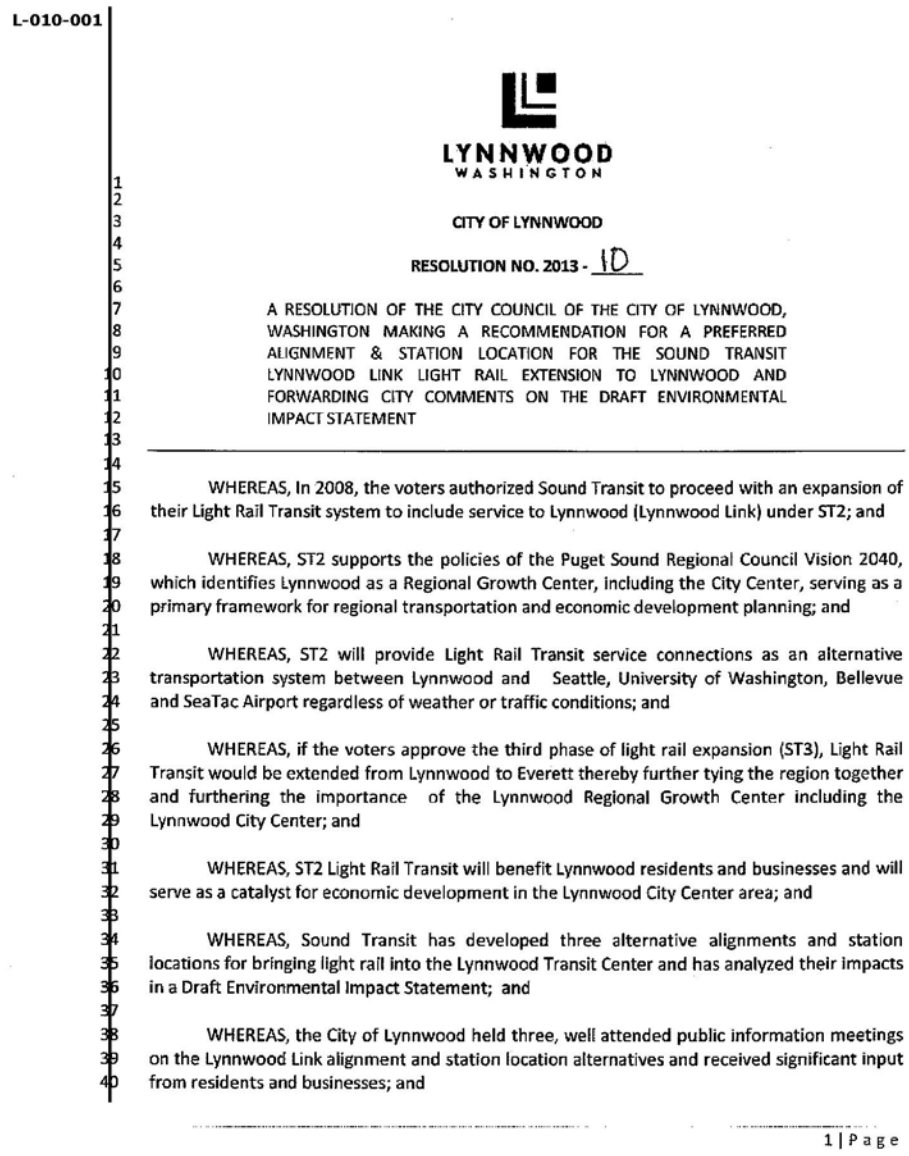
L-009-002

Thank you for stating your preferred alignment. See the response to comment L-009-001 describing the Sound Transit Board's Preferred Alternative.

L-009-003

Sound Transit appreciates the participation of the District in reviewing potential refinements in Segment C that would reduce potential impacts to the District's property. Sound Transit involved the Edmonds School District in meetings with the City of Lynnwood in the development of modified Alternative C3 that is evaluated in the Final EIS. The Final EIS also provides further detail on how Sound Transit would work with the City and the School District during final design and in construction planning to minimize impacts to the District's operations.

L-010-001



LYNNWOOD
WASHINGTON

CITY OF LYNNWOOD

RESOLUTION NO. 2013 - 10

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF LYNNWOOD, WASHINGTON MAKING A RECOMMENDATION FOR A PREFERRED ALIGNMENT & STATION LOCATION FOR THE SOUND TRANSIT LYNNWOOD LINK LIGHT RAIL EXTENSION TO LYNNWOOD AND FORWARDING CITY COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT

WHEREAS, In 2008, the voters authorized Sound Transit to proceed with an expansion of their Light Rail Transit system to include service to Lynnwood (Lynnwood Link) under ST2; and

WHEREAS, ST2 supports the policies of the Puget Sound Regional Council Vision 2040, which identifies Lynnwood as a Regional Growth Center, including the City Center, serving as a primary framework for regional transportation and economic development planning; and

WHEREAS, ST2 will provide Light Rail Transit service connections as an alternative transportation system between Lynnwood and Seattle, University of Washington, Bellevue and SeaTac Airport regardless of weather or traffic conditions; and

WHEREAS, if the voters approve the third phase of light rail expansion (ST3), Light Rail Transit would be extended from Lynnwood to Everett thereby further tying the region together and furthering the importance of the Lynnwood Regional Growth Center including the Lynnwood City Center; and

WHEREAS, ST2 Light Rail Transit will benefit Lynnwood residents and businesses and will serve as a catalyst for economic development in the Lynnwood City Center area; and

WHEREAS, Sound Transit has developed three alternative alignments and station locations for bringing light rail into the Lynnwood Transit Center and has analyzed their impacts in a Draft Environmental Impact Statement; and

WHEREAS, the City of Lynnwood held three, well attended public information meetings on the Lynnwood Link alignment and station location alternatives and received significant input from residents and businesses; and

1 | Page

L-010-001

Thank you for providing the City Council's recommendation for a preferred alignment and station location for the proposed Lynnwood Link Extension and providing comments on the Draft EIS. As you know, Sound Transit continued to work with the City and others to define a modification to Alternative C3 that incorporated this suggestion, and it has been analyzed in the Final EIS.

L-010-001

WHEREAS, the proposed C1 alignment is located directly across 52nd Ave. from a single family neighborhood containing hundreds of affordable homes, requires the removal of a condominium development and numerous businesses along 200th St., is across 200th St. from several affordable apartment and condominium complexes, all of which would be adversely impacted by noise, vibration, decline in property value, and other impacts from the elevated tracks; and

WHEREAS, the proposed C1 alignment is routed through a significant recreational resource in the form of the City's Scriber Creek Park that provides a place to experience nature in close proximity to Lynnwood's City Center; and

WHEREAS, Scriber Creek Park was acquired using Conservation Futures funding from Snohomish County, and WHEREAS, the proposed C2 alignment results in impacts similar to C1 to homes along 52nd Ave, impacts businesses along Cedar Valley Road, while not located within Scriber Creek Park and trail they are impacted due proximity, impacts Scriber Creek wetlands adjacent to the Park, and results in noise, vibration, and visual issues to these sensitive areas, and

WHEREAS, the proposed C3 alignment would result in significant property damage and loss of development potential on the City Center block located east of 44th and adjacent to I-5, would result in a station location remote from the bus transit center, existing residential development, public streets and City Center, would require reconstruction of the existing bus loading areas at great additional expense, would impact the City's ability to maintain and expand Sanitary Sewer Lift Station 10, and fails to address flooding and odor issues in the immediate area; and

WHEREAS, the City has developed a "C3 Modified" alignment and station location that offers the benefits of C3 in terms of avoiding impacts of C1 and C2 while also addressing the issues associated with C3; and

WHEREAS, the City of Lynnwood wishes to make Sound Transit aware of the City's preferences on potential alignments and station locations to insure they will be considered by the Sound Transit Board for their determination of a "Preferred Alternative".

THE CITY COUNCIL OF THE CITY OF LYNNWOOD, WASHINGTON, RESOLVES AS FOLLOWS:

1. That based upon a detailed analysis of the alternatives, review of the Draft Environmental Impact Statement and extensive public outreach efforts by the City, the Council is hereby expressing its preference for:

L-010-001

- "C3 Modified" that minimizes impacts to Lynnwood residents, businesses, development potential, parks and environment, while still offering the transportation benefits of Light Rail Transit service and the implementation of economic development planning policies.

2. That the City and Sound Transit will work directly together on "C3 Modified" as the preferred alternative Lynnwood Link Final Environmental Impact Statement to address mutual and respective goals for Sound Transit ST2 and the City of Lynnwood City Center Plan as part of the PSRC Regional Growth Center Strategy.

PASSED BY THE CITY COUNCIL the 23rd day of September, ~~2011~~ 2013

RE: Lynnwood Link DEIS comments

Dear Ms. Earl:

The City of Seattle is excited about the expansion of the regional transit system with the Lynnwood Link Extension. We appreciate the opportunity to comment in more detail on the proposed alignment and station alternatives presented in the DEIS. This letter represents joint recommendations from the Seattle Department of Transportation (SDOT) and the Seattle Department of Planning and Development (DPD). In addition to the alignment and station recommendations in this letter, you will also find a listing of more detailed comments, including coordinated comments from other city departments.

L-011-001
- **Seattle supports the A1 alignment option through Seattle** (*this alignment recommendation does not include the proposed A1 station locations).* This alignment best supports Sound Transit's Sustainability Plan by reducing noise and long-term visual impacts of adjacent neighborhoods, reducing private property impacts, replacing the 117th bridge benefitting bike and pedestrian connections, and reconfiguring the NE 130th freeway off-ramp addressing a high accident location. The related recommendations below further support and enhance the A1 track plan through Seattle.

L-011-002
- Work closely with SDOT and the Latvian Evangelical Lutheran Church and Center at 11710 3rd Avenue NE to maintain Seattle right-of-way to the facility. It is a priority to maintain access to this cultural, religious, and education center at the current location.

L-011-003
- In the reconstruction of 1st Avenue NE, work with Seattle to retain the trees and green space on the east side of 1st between 113th and 115th Street, which serves as a buffer to the Northgate West Condominiums.

L-011-004
- In the reconstruction of 1st Avenue NE and the 117th Street bridge, provide a 14' shared use bike and pedestrian facility on the north side of the bridge and a 8' sidewalk on the south side of the bridge connecting into similar facilities on the relocated 1st Avenue NE. Ensure these facilities connect to the existing bicycle trail at NE 116th Street.

L-011-001

Thank you for your comment stating a preference for Alternative A1, including the features that the City finds most promising. The Sound Transit Board identified a Preferred Alternative based on Alternative A1, but modified some of the alternative's features.

L-011-002

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). Access to the property and its functions has been maintained, although a small portion of land on the property's edge would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the refined alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods; Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative; and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property would require compensation to the property owner in accordance with Sound Transit policy and with federal and state law.

L-011-004

- With the significant light rail construction adjacent to 5th Avenue NE between 130th Street and 145th Street, include a sidewalk and bicycle lane on the west side of 5th Avenue NE between 130th and 145th Street. The DEIS identifies a lack of adequate facilities and access, particularly during nighttime hours.

L-011-005

- **Seattle supports including the 130th Street Station in Segment A, as a station configuration constructed as shown on Alternative A5/A10 – Option 1** (*page 65 of 142 of the DEIS Conceptual Plans*)**, a retained cut, center platform station. This option does not include surface parking north of the station.** This neighborhood-oriented station expands access to the regional transit system for Seattle residents and provides a unique opportunity for bus, bike and pedestrian access to several adjacent neighborhoods and communities. Per the "*Lynnwood Link Extension Station Area Transit-Oriented Development Potential*" report prepared by Sound Transit and dated April 2013, the 130th Street Station ranked highest in the Station Access category of any of the stations in Segment A. Additional points below support this recommendation.

  - Within Segment A, the 130th Street Station provides Sound Transit and King County Metro the best opportunity to provide efficient and reliable bus to rail and rail to bus connections on adjacent roadways with less traffic congestion and good connections to the relatively dense residential areas in Seattle's Lake City and Bitter Lake neighborhoods.

  - After the 185th Street Station, the 130th Street Station offers Sound Transit the highest ridership of the stations studied in Segment A. The ridership scenario with both a 130th Street Station and a 145th Street station indicates 3,200 average weekday riders at 130th and 2,200 average weekday riders at the 145th Street station.

  - This 130th Street Station is supported as a bicycle hub with City-proposed cycle track facilities on 130th Street, Roosevelt Way, 125th Street, and 5th Avenue NE incorporated in the draft update of the City Bicycle Master Plan.

  - By including both the 130th and 145th Street stations, ridership in Segment A benefits by an additional 400 daily boardings, providing increased ridership to Sound Transit from both Seattle and Shoreline.

  - The 130th Street Station supports Sound Transit's sustainability objectives by reducing additional SOV and bus trips to the congested Northgate Urban Hub. DEIS modeling suggests that up to 3,200 average daily trips would be captured at the 130th Street Station. Without this station, a percentage of those trips would contribute to congestion on other streets or require additional travel time on buses connecting to the Northgate Station.

The City of Seattle will continue to partner with Sound Transit on the implementation of the Lynnwood Link Extension. We look forward to working with you to expand the regional transit system and

2

L-011-003

The recommended action is consistent with the mitigation measures on Draft EIS page 4-91. Section 4.5.6 of the Final EIS has further details on the mitigation approach, and identifies areas where tree retention may be a possibility.

L-011-004

Sections 3.15 and 2.5 of the Final EIS identified pedestrian and bicycle improvements on 5th Avenue between NE 130th Street and NE 145th Street, and also clarify how Sound Transit would work with the City regarding other improvements during final design. The Board's Preferred Alternative includes an alignment to the east of the 117th Street bridge, which avoids the need to replace the bridge.

L-011-005

Sound Transit appreciates the summary of the benefits the City sees with a station at NE 130th Street. The Final EIS includes an option for a station at NE 130th Street.

providing safe, efficient and sustainable transportation choices for our residents and regional riders. If you have any questions about these recommendations, please don't hesitate to contact either of us or Michael James at michael.james2@seattle.gov or (206) 386-4012.

Thank you again for the opportunity to comment.

Sincerely,

Peter Hahn
Director, Department of Transportation

City of Seattle

Attachment: Seattle's Lynnwood Link Detailed Comment Listing

C: Tom Hauger
Michael James

Seattle's Lynnwood Link Detailed Comment Listing
September 20, 2013

In addition to the Lynnwood Link comment letter sent jointly from Peter Hahn, Director of the Seattle Department of Transportation (SDOT) and Diane Sugimura, Director of Seattle's Department of Planning and Development; the additional comments below are generally more detailed in nature and include additional comments from city departments that wished to incorporate their specific comments collectively.

L-011-006

1. To preserve existing in-city housing stock, the City of Seattle recommends that demolition of existing housing units be mitigated through production of an equivalent number of comparable housing units in the vicinity of any demolished unit. (Office of Housing)

2. The City further requests Sound Transit conduct a household income survey to determine the income levels of the households currently occupying the housing identified for demolition. This information is critical to develop a just and fair mitigation strategy for households at or below 50% of area median income. A mitigation strategy should include providing relocation expenses for low-income households and contributing to the replacement of units at or below the affordability levels of the demolished units. Contributions to the replacement of affordable housing could be in the form of direct subsidy to the production or preservation of affordable housing in the near vicinity or donation of Sound Transit surplus property for the development of affordable housing. (Office of Housing)

L-011-007

3. The Department of Planning and Development acknowledges the refinements suggested in the pre-DEIS review and included in the DEIS relating to the land use map and zoning maps, comprehensive plan and other plan documents. (DPD)

L-011-008

4. In section S.6.1 (Transportation) revise the last sentence to read, "…traffic management, or other strategies including bicycle, pedestrian and transit improvements." (SDOT)

L-011-009

5. In section S.6.3 (Environmental Justice), impacted populations (in Seattle) would only benefit from improved access to transit if there is a station that offers access that is convenient and reliable. The 130th St. Station best provides convenient access to members of impacted populations in Seattle. (SDOT)

L-011-010

6. In section S.7.1, SDOT disagrees that the 130th St. Station "would not notably increase system ridership because it would cause riders to shift from the Northgate Station." There are a few reasons for this.

   a. Ridership modeling assumed only one bus route feeding the 130th Station. By way of comparison, the 145th Station had four routes feeding it. In modeling the A10/A11 configuration (with stations at 130th and 145th), 130th had 1,000 more average weekday boardings than 145th with only one bus feeder route. With two or three buses feeding the 130th St. station, ridership would be noticeably more pronounced.

1

L-011-006

Sound Transit recognizes the City's concern for maintaining an adequate supply of affordable housing units within the city. Sound Transit's policy provides for a fair and equitable means of addressing real property impacts across its projects, and this includes a commitment to relocate displaced individuals in a manner consistent with state and federal law, as stated in Section 4.1. Sound Transit has successfully implemented this policy on several of the Link light rail projects developed within the City of Seattle, and which affected more properties than are potentially impacted by the Lynnwood Link Extension. While Sound Transit will endeavor to relocate displaced parties in the same neighborhood or area, the work is done in consultation with the displaced parties, who may or may not choose to stay in the same area. They will, however, be placed in housing that is affordable to them; this effort includes interviews with the affected parties to help determine affordability, as well as compensation and assistance programs that meet individualized needs and ensures safe and sanitary dwellings. Sound Transit generally does not enter into negotiations with affected parties until after the completion of the NEPA/SEPA process. Sound Transit may consider opportunities for making surplus property available for redevelopment, but this would not be considered as mitigation for displacements, which would be fully mitigated through the existing policy commitment defined in Section 4.1 of the Final EIS and compliance with state and federal requirements.

L-011-007

Sound Transit appreciated the City's review and suggestions leading up to the Draft EIS.

L-011-008

Sound Transit has revised the sentence generally as suggested for the Final EIS.

L-011-010

b. Metro and the DEIS have indicated that bus routes can be adjusted to better feed stations, increasing regional ridership and efficiency.

c. This assumes the same number of regional riders would endure congested drives or riding bus routes travelling into the much more congested Northgate Urban Hub as would bus, bike, walk or kiss and ride a shorter distance to a neighborhood station at 130th.

d. Regional rail modeling does a good job of capturing walk access, but it does not do an accurate job of capturing bicycle access to stations. With the proposed bicycle improvements in the 130th station area, we believe this market is being under reported for model year 2035.

e. This point is contrary to information in the Transportation Technical Report, page 5-9 (see comment 13 below).

7. Table 4-18 in the Transportation Technical Report supports routing more buses along 130th and 125th Streets to a station rather than along 145th Street based upon the reported Daily Traffic Volume and available lanes. (SDOT)

L-011-011

8. In section 4.5.1 of the Transportation Technical Report, SDOT concurs with the assessment of the lack of ADA sidewalks on the west side of 5th Avenue NE between NE 130th and NE145th and recommends installing ADA compliant curbs and sidewalks with the reconstruction of the street and freeway frontage.

L-011-012

9. Section 4.5.2 (Bicycle Facilities) of the Transportation Technical Report - In the FEIS, SDOT recommends inventorying all arterials within 3 (not 1) miles of each station. This is in alignment with new direction from the FTA relating to eligible bicycle infrastructure funding.

L-011-013

10. Table 4-34 in the Transportation Technical Report supports reconfiguring the NE 130th Street northbound off-ramp to 5th Avenue NE to improve safety as proposed in alignment A1.

L-011-014

11. Section 5.2 in the Transportation Technical Report supports the recommendation for Sound Transit to work closely with King County Metro and SDOT to develop an efficient bus restructure capitalizing on the opportunities of the 130th St. Station. (SDOT)

L-011-015

12. Table 5-8 in the Transportation Technical Report – SDOT disagrees with the assumptions in the assumed feeder bus service to light rail stations. In the preparation of the FEIS, work closely with SDOT and King County Metro to develop an updated feeder network to ensure the most efficient routing and understanding of bus facilities such as stops and speed and reliability improvements that can be coordinated with Seattle and Metro.

L-011-009

Sound Transit notes your comment. Thank you.

L-011-010

The conceptual service plans used for the Draft EIS analysis was based on assumptions developed in coordination with the transit service providers. Sound Transit has updated its ridership forecasts for all alternatives in the Final EIS to incorporate updated land use forecasts, although changes to the assumed service plan have been limited. This includes updated forecasts for the NE 103th Street Station, which is an option for the Preferred Alternative. While it is accurate that the regional rail transit model does not specify bicycle access shares, the modeling inherently includes all riders across modes. While this may slightly overstate the shares of the other access modes by not separating out bicycles, it is appropriate for the purposes of an EIS analysis and the conceptual level design efforts being conducted at this stage of the project.

L-011-011

Sound Transit will meet ADA standards for any facility that it constructs or modifies, and will work with the City of Seattle during final design to confirm the specific design approach for features such as sidewalks and curbs.

L-011-012

While Federal Register Vol 76, No. 161 identifies a bicycle catchment area of 3 miles to identify streets with a de facto physical and functional relationship to transit, and therefore eligible for FTA funding, it does not require high capacity transit projects to analyze the full area in an EIS or incorporate improvements covering that area. Pedestrian and bicycle facilities developed as part of the project, as well as other access features at Lynnwood Link Extension stations, will be developed

Seattle's Lynnwood Link Detailed Comment Listing
September 20, 2013

L-011-016 13. Page 5-9, third bullet, in the Transportation Technical Report, is contrary to Section S.7.1 (discussed in comment 6 above). "Adding a third Segment A station would result in a net increase of 400 daily boardings in the segment because it would provide more access points to the transit market." Revise the summary language per this information. (SDOT)

L-011-017 14. Section 5.2.2. in the Transportation Technical Report, supports comment 12 (above), specifically, "Near the NE 145th Street Station, the impact of additional traffic associated with that station would contribute to already congested conditions (LOS E-F), which could impair the ability of local bus service to provide reliable access to the station." (SDOT)

L-011-018 15. Section 5.2.2., page 5-32 in the Transportation Technical Report – for alternatives A5 and A10, write out the alternatives specific to the correct streets, do not say that impacts would be the same as another alternative on a different street. (SDOT)

L-011-019 16. Section 5.5.1. in the Transportation Technical Report – Explain how bicycle trips and bicycle facilities influence this evaluation. Explain how bicycle trips are factored in Table 5-31. If not explained in this section, identify how and where they are considered for trip generation. (SDOT)

17. Page 5-96 of the Transportation Technical Report; clarify if the planned Jackson Park Perimeter Trail would meet any ADA requirements for a trail, sidewalk or shared use path. (SDOT)

L-011-020 18. The Transportation Technical Report, page 5-123 states, "If a station is selected for NE 145th Street, the station design and design of adjacent streets would need to address the current and expected increase in conflicts between vehicles and between travel modes near the station, as reflected in the existing High Accident Locations (HALs)." Define the alternatives for mitigating impacts. Is reduction of at station parking an alternative to reduce congestion impacts? (SDOT)

L-011-021 19. SDOT recommends the following refinements and/or revisions to sheet 65 of the DEIS Conceptual Plans:

a. Expand the pedestrian plaza at the northwest corner of NE 130th St and 5th Avenue NE to accommodate a bus shelter/weather protection

b. Design to the station and bus drop off to accommodate multiple routes and stop locations. For the FEIS, discuss alternative bus feeder alternatives and facility needs based upon meetings with King County Metro and SDOT.

c. Include 8 kiss-and-ride drop off spaces

3

consistent with the Board-adopted System Access Policy (Resolution R2013-03), which provides criteria to be used in defining access features throughout the system. Many of these elements will be further defined during final design and permitting, as Sound Transit continues to coordinate with local agencies to determine station access features and to seek further opportunities to partner with the other agencies to maximize the benefits of this major transit investment.

L-011-013

An option with the reconfigured NE 130th Street northbound off-ramp is part of the Preferred Alternative for Segment A. As stated in Section 3.2.8 of the Final EIS and Section 5.8 of the Transportation Technical Report, this improvement is likely to improve safety at this location.

L-011-014

As noted in Chapter 3, Section 3.2.2 of the Final EIS, Sound Transit would coordinate with King County Metro and Community Transit on potential local bus service modifications as the project enters final planning leading to operation. However, the changes in services would be made by the local transit agencies, who have their own policies and processes for considering service revisions.

L-011-015

The assumptions used for the Draft EIS were developed in coordination with King County Metro and were intended to help develop ridership forecasts for each station. These draft transit integration plans were not intended to fully define the range of transit improvements that King County Metro or others might undertake in connecting corridors. Consistent with the approaches used for other projects that Sound Transit has implemented, including the light rail lines in place or in development in the city, this detailed integration planning would occur after the Final EIS is complete and the project is in preparation for

Seattle's Lynnwood Link Detailed Comment Listing
September 20, 2013

L-011-021 d. Design multiple drop off parking spaces that do not require all trips to use 5th Avenue NE (locations may require use of existing signalized pedestrian crossings)

L-011-022 20. Suggest including an assessment of public places that are enhanced by light rail station access. A criteria that documents well established neighborhoods is also recommended. This should be a part of the transit supportive plan and policy documentation. (SDOT)

L-011-023 21. With construction impacting I-5, 1st Avenue NE, 5th Avenue NE, Roosevelt Way NE and NE 130th Street, protect and enhance drainage, including waters that may influence the Thornton Creek water course. (SPU)

22. Coordinate future design efforts impacting drainage, such as new curb, gutter and sidewalks with Seattle Public Utilities (SPU) and SDOT. (SPU)

4

operations. King County Metro has revised its service integration concepts for a 130th Street Station for the Final EIS to include additional service, and the results of those changes are reflected in the Final EIS forecasts and updated station design.

L-011-016
The summary text has been updated for the Final EIS.

L-011-017
For the Preferred Alternative, the Final EIS incorporates improvements to help minimize potential travel delays that could affect local bus service to the station. The other alternatives identify these potential improvements as mitigation.

L-011-018
Sound Transit has updated the Transportation Technical Report, and has revised text to clarify the locations identified in the comment.

L-011-019
Bicycle trips were not factored into the pedestrian LOS analysis, because detailed bicycle access projections were not available or necessary to support project planning at this stage of the project. While the Sound Transit model does not address bicycle access shares, the modeling inherently includes all riders. Pedestrians walking between rail and their parked bicycles are reflected in the overall numbers contained in Table 5-31 of the Transportation Technical Report.

Sound Transit is not proposing an alteration to the Jackson Park Perimeter Trail.

L-011-020
The Final EIS Chapter 3, Transportation, and the Transportation

Technical Report and Chapter 3 of the Final EIS have the results of an updated analysis of the NE 145th Street Station area using microsimulation software. The Preferred Alternative incorporates design measures for local street improvements that would address the added traffic related to the station and park-and-ride, and improved signalization and an added signalized intersection at the I-5 ramps also helps address a known accident location. The simulation software evaluates the effectiveness of transportation improvements incorporated within the design for the Preferred Alternative, as well as for other mitigation measures described in the Final EIS. The Final EIS also has additional language in mitigation explaining how Sound Transit will work with local agencies during final design to develop and implement mitigation details.

L-011-021

Sound Transit will refine details such as the plaza size, weather protection at the station and bus platforms, and further detail on bus transit service assumptions and requirements following the Final EIS, if this station is included as part of the project.

L-011-022

Section 4.4 and Appendix C now include a list of public places that would be near each station. Neighborhoods served are also described in Section 4.4, although Sound Transit did not attempt to characterize neighborhoods in qualitative terms. Many of the Draft EIS public comments served to inform the Sound Transit Board of how members of those neighborhoods perceived the project as either benefiting or impacting their communities. The Transit Oriented Development Assessment conducted for the project is not part of the EIS but was updated as part of other documentation for the project to reflect the Preferred Alternative.

L-011-023

As described in Section 4.9.6 of the Draft EIS, the project would comply with all federal, state, and local regulations protecting water quality. Approaches will include project planning, design, and the application of Best Management Practices (BMPs). Sound Transit will coordinate with Seattle Public Utilities regarding future design efforts for drainage where applicable.

communitytransit

Joyce Eleanor, Chief Executive Officer

September 23, 2013

Sound Transit, Draft EIS Comments
C/o Ms. Lauren Swift
401 S. Jackson St
Seattle, WA 98104

Dear Ms. Swift:

L-012-001 Community Transit strongly supports the Lynnwood Link Extension (Link). Once opened, it will significantly increase mobility options for Snohomish County residents by providing fast, frequent, and reliable service between Snohomish County and the greater Puget Sound Region. Community Transit will do our best to effectively serve Link stations in Snohomish County. Our comments in the current environmental review process focus on mitigation to preserve mobility during construction and system design elements that will enable effective bus-rail integration.

L-012-002 Surveys suggest 40 percent of all Snohomish County residents commuting to jobs in downtown Seattle use transit via Interstate-5 (I-5). Link construction impacts on general purpose traffic will further increase transit demand. Protection of this transit market needs to be a top priority in construction mitigation. Today's regional bus riders are the basis for the future light rail market.

Mitigation should provide service equal to or better than what is provided today. I-5 is already congested, in both general purpose and HOV lanes, impacting speed and reliability of transit. Where I-5 lane closures are called for, these should occur on nights and weekends when demand is reduced. Where HOV lane or direct access ramp impacts are unavoidable, an alternative priority path for transit should be implemented. Accommodating higher transit demand during construction will likely require mitigation in the form of funding for additional buses and service hours, as well as transportation demand management (TDM) strategies. With effective mitigation, transit demand will continue to grow, providing a strong, healthy market at the opening of Link light rail service to Snohomish County in 2023.

L-012-003 It is understood that most users of Link will access the system via walk or bus. The final system design should prioritize effective integration with the bus network, safe, convenient pedestrian access and potential for transit oriented development (TOD). The number and location of stations, should meet Sound Transit's Long Range Plan vision to provide reliable, rapid, and efficient service to meet the existing and projected demand for regional travel within the corridor and to other urban centers in the central Puget Sound. With this framework in mind, Community Transit's main input on design includes:

L-012-004
- Prefer Lynnwood Transit Center alternative C1, along 200th St SW, which provides effective pedestrian access, transit integration and TOD potential.

L-012-005
- Concern with Lynnwood Transit Center alternative C3 Option 1 (along I-5), which would be difficult for transit to serve, has poor pedestrian access and little TOD potential.
- Concern with Lynnwood Transit Center alternative C3 Option 2. It provides better transit integration, but still has long walks for pedestrians and little TOD potential.

7100 Hardeson Rd. Everett, WA 98203-5834 ph (425) 348-7100 fx (425) 348-2319 TTY Relay: 711 www.communitytransit.org

L-012-001

Thank you for your comment stating support for the Lynnwood Link Extension and for Community Transit's intent to effectively serve Link stations in Snohomish County.

L-012-002

Sound Transit recognizes the need to support and maintain transit markets during construction. However, the project does not anticipate that impacts to I-5 will occur throughout the construction period, and many of these impacts would be reduced by working closely with WSDOT, FHWA and the transit agencies operating along the corridor to develop a coordinated plan to maintain mobility during the shorter periods when traffic would be affected by construction affecting the freeway itself. This is consistent with the construction approach (Section 3.3) and the mitigation measures (Section 3.6) described in the Final EIS. Section 3.6 identifies potential mitigation to be developed with its partners, including service increases, service modifications, or temporary service improvements. The Final EIS also provides more definition of the location and duration of closures and their related impacts, as well as minimization measures such as timing closures to be in off-peak periods, evenings, or weekends where possible.

L-012-003

Comment noted. Sound Transit agrees with these observations.

L-012-004

Thank you for your comment stating a preference for Alternative C1.

L-012-005

The Final EIS includes a modified Alternative C3 as part of the Preferred Alternative. The modifications help address the access and TOD development issues that this comment raises.

L-012-006 • Note that the 220th Street SW station (B2A) is not a focus of existing or planned bus service, unlike the nearby hubs at both Lynnwood Transit Center and Mountlake Terrace Transit Center.

L-012-007 • Prefer the Mountlake Terrace elevated station crossing over NE 236th (B1, B2), which provides the best pedestrian access, transit integration and TOD potential.

L-012-008 • Concern with Mountlake Terrace alternative B4 (Freeway Station), which has compromised market potential and construction impacts that would be very costly to mitigate.

L-012-009 • Note that the assumption of *Swift* BRT service to the 185th St Station requires transit priority infrastructure along NE 185th between Aurora Avenue and I-5 to ensure speed and reliability.

Our detailed comments on construction impacts and system design are attached to this letter.

L-012-010 As stated above, Community Transit is a strong supporter of this light rail extension to Snohomish County. We appreciate the opportunity to comment on the DEIS and are hopeful that Sound Transit will be visionary in their selection of design alternatives that provide the most effective integrated transit system for the future mobility of the Puget Sound region.

We also look forward to coordinating with Sound Transit as they identify funding and strategies to mitigate impacts to existing transit markets during construction of Link.

Sincerely,

Joyce Eleanor
Chief Executive Officer

kegt
Enclosure
cc: Community Transit Board of Directors
Community Transit Corridor Working Group

Page 2

L-012-006

Sound Transit recognizes that the 220 Street SW Station is not the focus of Community Transit's existing or planned transit service, but the presence of a station at that location has been suggested by local jurisdictions and others because the arterial is a major corridor serving Edmonds and other communities. The Preferred Alternative includes an option for a station at that location, and its benefits would be higher with connecting transit service.

L-012-007

Thank you for your comment stating a preference for the elevated station featured in Alternatives B1 and B2.

L-012-008

Comment noted. Your observation of the transit impacts during construction for the freeway station being difficult or expensive to mitigate are consistent with the Draft EIS findings, although mitigation options would be available.

L-012-009

Although Sound Transit agrees that transit priority treatments might benefit a Swift extension from Aurora Village Transit Center to NE 185th Street Station, Sound Transit has not included the improvements as part of the Lynnwood Link Extension. Sound Transit supports transit improvements that would serve the station, and will continue to work with Community Transit, as stated in Section 3.2.2 of the Draft EIS.

L-012-010

Thank you for your comments and collaboration on the Lynnwood Link Extension.

Community Transit Comment Detail:
Sound Transit - Lynnwood Link Extension DEIS

Segment A (Seattle to Shoreline)

L-012-011 Station Alternatives:
If it is decided that Community Transit's *Swift* bus rapid transit (BRT) system is the appropriate fixed-route bus service to feed the 185th Street Station in Shoreline, BRT infrastructure needs to be provided. BRT infrastructure can include high occupancy vehicle (HOV) or Business and Transit (BAT) lanes, signal priority, and intersection improvements, such as queue jumps to maintain speed and reliability along NE 185th Street between the Link station and Highway 99.

L-012-012 Construction Impacts:
I-5 lane closures are possible within Segment A if Alternatives A1, A5, or A10 are chosen: one-lane in each direction on I-5 could be closed for up to 2 months. The possible 24-hour I-5 lane closures would occur at NE 117th Street, NE 185th Street, and NE 130th Street. The NE 130th Street northbound off-ramp might also be closed. I-5 lane closures would further increase congestion and delay. As noted in our letter, construction mitigation needs to provide transit with an ongoing priority path in this corridor.

Segment B (Shoreline to Mountlake Terrace)

L-012-013 Station Alternatives:
Alternatives B-1 and B-2 (elevated station crossing 236th St SW): Community Transit prefers these alternatives because the proposed station location provides for efficient transfers between Link light rail and fixed-route bus service. It has the greatest potential for transit oriented development (TOD) to occur around the facility, and provides for good pedestrian connectivity between the station, Mountlake Terrace Town Center, and the Freeway/Tourism sub-area just south of 236th St SW.

L-012-014 Alternative B-2A (station at 220th St SW): Community Transit's future network plans do not anticipate significantly increased bus service along 220th St SW. A station at this location is assumed to be primarily the focus of pedestrian access limited to the immediate vicinity.

L-012-015 Alternative B-4 (freeway station): Community Transit does not support this alternative because of the separation between the proposed Link station and fixed-route bus service, increasing the already long walk between the transit loop off 236th St. SW and the Freeway Station. The DEIS states this location will result in the loss 1,000 daily boardings. It has the least amount of potential to spur future TOD development and it would eliminate any future use of the existing freeway station for fixed-route bus service.

L-012-016 Construction Impacts:
I-5 lane closures within Segment B are possible for all proposed rail and station location alternatives during the construction activities to install support structures in the median, including the reconstruction of the NE 195th Street pedestrian/bike overcrossing, and reconstruction of 236th Street SW adjacent to the new station. As stated above, any short or long-term lane closures on I-5 will increase congestion causing additional delay. Construction of the elevated guideways could also impact signal operations on 236th Street SW. This could also add delay for vehicles, including buses, accessing I-5 to and from the Transit Center.

L-012-011

As the project progresses into final design, Sound Transit will continue to coordinate with Community Transit and the City to encourage Swift service from Aurora Village to the NE 185th Street light rail station. However, the Lynnwood Link Extension project does not include specific transit priority or BRT improvements between the corridors leading to the station.

L-012-012

Please see Sections 3.3 and 3.6.9 of the Final EIS for further detail on the project's potential construction activities, impacts, and the mitigation plan for construction, including the mitigation approach for transit. While the emphasis is on the Preferred Alternative for each section, a similar mitigation approach would apply to other alternatives. However, it is important to note that these are assumptions on construction approach for the purposes of an EIS analysis of potential impacts and mitigation. The level of impacts, including their duration, depends on issues that will be further developed during final design, subject to FHWA and WSDOT approval, and also influenced by a contractor's approach to construction. The mitigation in Section 3.6.9 therefore emphasizes detailed coordination with the transit agencies and WSDOT as mitigation details are further refined.

L-012-013

Thank you for your comment.

L-012-014

The project would not begin service until 2023. Sound Transit recognizes this is within the period covered by Community Transit's Long Range Plan (2030). However, as outlined in Community Transit's Long Range Plan: *Thinking Transit First* (pages 23-24), Community Transit plans to serve productive route segments to local activity

L-012-016

The greatest impacts to transit will occur if the direct access ramps to the Mountlake Terrace Freeway Station are closed as proposed with Alternative B-1 (for up to 2 months) and B-2/B-2A (for between 2 and 12 months). Alternative B-4 would permanently close the Mountlake Terrace Freeway station at the beginning of construction. Such closures would have a significant impact on transit, requiring reroutes through the City of Mountlake Terrace, causing significant increases in travel time, requiring temporary bus stops, and further compounding the traffic delays that would be caused by lane closures on I-5.

It is imperative that transit service between Snohomish County and King County be protected during construction. Therefore, mitigation is required to maintain and/or improve the existing service levels during the construction phase of the Lynnwood Link Extension project. As stated earlier, transit demand is anticipated to increase as additional congestion negatively impacts general purpose travel lanes on I-5.

Mitigation required for Community Transit to maintain existing inter-county transit service for the construction of the Lynnwood Link Extension includes, but is not limited to, financial assistance for operating and capital expenses to increase service and/or provide reroutes as suggested as a construction mitigation strategy in the DEIS, maintain ingress and egress to the Mountlake Terrace parking garage, maintain ingress and egress to the Mountlake Terrace Freeway Station, use the late night I-5 lane closures option instead of 24-hour lane closures, maintain or improve HOV lane operations, and deployment of a very proactive TDM program.

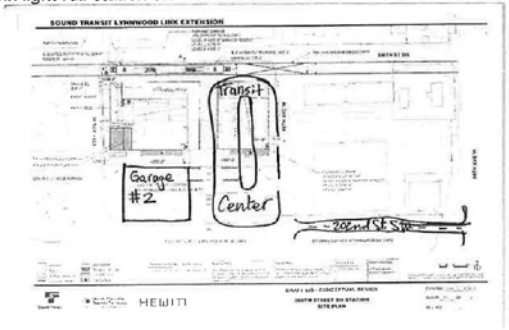
Segment C (Mountlake Terrace to Lynnwood)

L-012-017

Station Alternatives:
Alternatives C-1: With modifications, this is Community Transit preferred station location because it provides for efficient transfers between Link light rail and fixed-route bus service. It has the greatest potential for transit oriented development (TOD) to occur around the facility, further building the transit market and it provides the best pedestrian connections of all there alternatives between the facility, the 196th Street Corridor and Lynnwood's City Center.

The following modifications are suggested:

- Flip the east parking garage with the transit center to further reduce the distance to transfer between the Link light rail station and fixed-route transit center: see illustration below.



centers with an emphasis on transit centers and Link light rail stations. The plan also states that the local routes will be designed to coordinate with higher level of services, especially regional commuter express routes, Swift corridors, commuter rail, or light rail routes. The Long Range Plan specifically identifies 220th Street SW as a facility that provides a critical local link.

As stated in Section 3.2.2 of the Final EIS, Sound Transit anticipates partnering with Community Transit to consider local or regional service revisions integrated with light rail service for development as part of the Lynnwood Link Extension.

L-012-015

Sound Transit acknowledges Community Transit's concerns with Alternative B4, which include lower TOD potential, longer walks, and lower ridership.

L-012-016

Please see response to comment L-012-002.

L-012-017

Thank you for your comment stating a preference for Alternative C1 and providing reasons and proposed modifications for this alternative.

L-012-017

- Provide covered pedestrian pathways between Link, the parking garages, and the transit center.
- Provide an elevated and covered pedestrian bridge from the Link Station to the north side of 200th Street SW.
- Widen 200th Street SW to accommodate the additional traffic resulting from the construction of the Lynnwood Link Extension and additional parking garages, in addition to the transit center.
- Designate 46th Avenue W, south of 200th Street SW, HOV only.
- Open 202nd Street SW between 44th Avenue W and 46th Avenue W to create a secondary access point to the facilities at Lynnwood Transit Center.
- Retain or relocate Community Transit's Ride Store in close proximity to the transit center.

L-012-018

Alternative C-2: Community Transit could also support this alternative, with modifications. This location would still provide for a convenient transfer point between Link light rail and the fixed-route transit center. TOD opportunities are still available. However, the pedestrian connectivity is not as good as that provided the 200th Street SW location for pedestrians destined for businesses along the 196th Street Corridor and within City Center.

The modifications requested for consideration are:

- Retain Community Transit's Ride Store at its current location, in close proximity to the transit center.
- Provide covered pedestrian bridges between the Link station, transit center, and parking garage.
- Designate 46th Avenue W, south of 200th Street SW, HOV only.
- Open 202nd Street SW between 44th Avenue W and 46th Avenue W to create a secondary access point to the facilities at Lynnwood Transit Center.

L-012-019

Alternative C-3 Option1: Community Transit does not support this alternative because of the significant separation between the proposed Link station and fixed-route bus service. It has the least amount of potential to spur future TOD development that will increase the transit market and it has the worst pedestrian connections between the Link station, transit Center, parking garage and commercial developments along the 196th Street Corridor and City Center of all the alternatives.

L-012-020

Alternative C-3 Option 2: Community Transit has concerns with this alternative. Although it improves the transfer point between Link light rail and fixed-bus transit service, the remaining issues identified with Alternative C-3 Option 1 remain. Additionally, the relocated transit center would increase travel running times for buses serving the facility and increase operating costs.

L-012-021

Construction Impacts:
Mitigation required for Community Transit to maintain existing inter-county transit service for the construction of the Lynnwood Link Extension includes, but is not limited to, financial assistance for operating and capital expenses to increase service. The rest of the construction impacts are directly related to the station location for Lynnwood Transit Center.

L-012-022

Alternative C-1, with the modifications suggested by Community Transit, would require a temporary transit center while the facility is being constructed. This could occur in the existing park and ride facility. It would further reduce the number of parking stalls available. TDM measures and increase in local feeder service could mitigation these additional impacts.

L-012-018

Thank you for your comment stating support for Alternative C2 and providing reasons and proposed modifications for this alternative.

L-012-019

Community Transit's concerns with Alternative C3 Option 1 are noted. Please see response to comment L-012-005.

L-012-020

Community Transit's concerns with Alternative C3 Option 2 are noted; the range of alternatives in Lynnwood was developed to explore the differences that variations in sites and layouts might offer in terms of transportation performance, costs, and environmental impacts. The distance between the existing transit center and the new site is relatively small.

L-012-021

As described in Section 3.6.9 of the Final EIS, any plans involving transit service modifications would be coordinated with King County Metro, Community Transit, and private transit service providers to minimize construction impacts and disruptions to bus facilities and service.

Please see response to comment L-012-002 for a discussion of construction impacts and mitigation.

L-012-022

Sound Transit appreciates the suggestions for Alternative C1, but the transit center would not need to be closed during construction. The other detailed suggestions for facilities and amenities involve design definitions that would be determined at later stages of the project, and Sound Transit would involve Community Transit and others to participate in the development of such designs regardless of the alternative

L-012-023 Alternative C-2, with the modifications suggested by Community Transit, does not appear to impact transit operations in the area. However, if TDM were used to mitigate the reduction in parking available, funding would be needed to increase service.

L-012-024 Alternative C-3, Options 1 and 2, do not appear to impact Community Transit operations in and out of the Lynnwood Transit Center. As stated above, funding would be needed to provide additional local feeder service, as a mitigation measure for the loss of 560 parking stalls.

Additional Comments and Mitigation Suggestions
In addition to the specific comments provided above, Community Transit is providing the following general comments for future design consideration and additional mitigation measures.

L-012-025
- Where elevated tracks are constructed over local roads, a minimum height clearance of sixteen feet would be required to accommodate the Double Tall buses. This would allow maximum flexibility for Community Transit when developing future service in south Snohomish County.

L-012-026
- There are additional highway projects that would significantly enhance the transportation system, during and after the completion of the Link light rail extension to Lynnwood:
  - Direct access between the NB I-5 HOV lanes and SB Interstate 405 (I-405) HOV lanes
  - Direct access between NB I-405 HOV lanes and the SB I-5 HOV lanes
  - Direct access between SB State Route (SR) 525 and the SB I-5 HOV lanes
  - Direct access between the NB I-5 HOV lanes and NB SR 525

  By providing direct access points between the HOV lanes of different freeway systems, the potential for accidents would be reduced and traffic flow improved by eliminating the need for HOVs to cross into general purpose lanes to access the connecting route. These improved connections would also reduce travel times and the cost to provide bus service. The SR-525 to I-5 SB connection would enable Community Transit to remain on the freeway system, thus providing improved service between Mukilteo and destinations in King County.

L-012-027
- Sound Transit is encouraged to work with the Washington State Department of Transportation (WSDOT) to adjust the carpool policy from 2+ to 3+ as a construction mitigation measure.

selected. It is correct that any of the alternatives involving construction on existing park-and-ride facilities would reduce the available parking supply, and that transit and TDM measures could help address the impact.

Please see response to comment L-012-002 for a discussion of construction impacts and mitigation.

L-012-023
Sound Transit appreciates the suggestions for Alternative C2. As described in the previous response (L-012-022), such details will be determined later in the project by Sound Transit in collaboration with Community Transit and others.

L-012-024
The Final EIS Chapter 3, Section 3.6.9., includes further discussion of mitigation options for the loss of parking stalls during construction. Improvements in transit service are among the options identified.

L-012-025
Sound Transit's existing design standard for placing guideways over any roadway is a minimum 16.5-foot vertical clearance.

L-012-026
Sound Transit agrees that there are a number of other projects, including HOV direct access improvements, that could complement the Lynnwood Link Extension and address other transportation needs and problems. However, they are beyond the scope of the project being studied in the EIS.

L-012-027
Changes to the carpool policy from 2+ to 3+ will be discussed with

Community Transit Comment Detail:
Lynnwood Link Extension Transportation Technical Report

L-012-028

1. Pages 4-25 through 4-36, Section 4.2.2 (Regional Transit): it is not clear if LOS analysis is for Sound Transit only or includes all agencies. The information provided for transit frequency, hours of service, and passenger load read as if the analysis includes Community Transit, King County Metro, and Sound Transit; whereas, the data for reliability and on-time Performance only includes Sound Transit data.

L-012-029

2. Page 5-31, Local and Sub-Regional Bus Transit: thank you for including the last sentence for the NE 185th Street Station regarding transit priority treatments along NE 185th Street for *Swift* BRT service to the station.

3. Page 5-33: Community Transit concurs with the continued use of the Mountlake Terrace Freeway flyer station for Alternative B-1, B-2, and B-2A, as a connection point between bus transit and Link light rail service.

L-012-030

4. Page 6-1, Construction Impacts: the third bullet states the at-grade rail alignments and bridge reconstruction proposed with Alternatives A1, A5, and A10 could require lane closures on I-5, one in each direction, for up to one month.

   Any lane closures that increase traffic volumes on I-5 have a negative impact on transit operations, and must be mitigated. The existing transit riders making use of current inter-county bus service are future Lynnwood Link customers. This existing market needs to be protected during the construction of Link. It is also likely that demand for transit service will increase as I-5 conditions deteriorate in the general purpose lanes.

   To minimize these impacts, I-5 lane closures should be limited to late night and weekends, the HOV lanes should be increased from 2+ to 3+ passengers per vehicle to maintain speed and reliability for the existing inter-county bus service.

5. Page 6-1, Construction Impacts: the fourth bullet states elevated alignments will require night time closures. This should not impact Community Transit operations, but could impact Sound Transit's 500 series Express bus service between Snohomish and King Counties.

6. Page 6-1: the sixth bullet states Alternatives B1 and B2/A require construction in the median on I-5, adjacent to the transit center: construction activity will require the direct access ramps and freeway flyer station to close for 1 to 2 months.

   Sound Transit needs to work with WSDOT to find an alternative to closing the Mountlake Freeway Station: any closure of this facility will have significant negative impacts on Community Transit Commuter and Sound Transit Express Bus service. The most significant impact is, but not limited to, major reroutes for the existing eight commuter/express buses that stop at this facility. These reroutes will impact travel time, which will add to the operating and, possibly, capital costs to provide this service between Snohomish and King Counties during the construction phase of the Lynnwood Link Extension.

7. Page 6-1: the last bullet states construction of the light rail station will reduce the number of park & ride stalls. Mitigation could include TDM measures to encourage drivers to use local

WSDOT as the mitigation program continues to be developed and refined during final design. This measure could also be an element of the construction traffic management strategy for I-5 lane closures.

L-012-028

Section 3.2.2 of the Final EIS has been updated to clarify that the LOS analysis for transit frequency and hours of service included Sound Transit, King County Metro and Community Transit services, and that the reliability and on-time performance data are primarily from Sound Transit.

L-012-029

Thank you for your comment.

L-012-030

Please see response to comment L-012-002 for a discussion of construction impacts and mitigation.

L-012-030

transit options to access the Lynnwood Transit Center during construction; however, no specifics are provided for the TDM strategies. One suggestion is partnering with Community Transit to increase the coverage of the Curb the Congestion program. Additionally, if Community Transit is the provider of the "local transit option," financial assistance will be needed for operating and capital costs to provide such service.

8. Page 6-10, Segment A, General Purpose Traffic Impacts: confirms impacts to transit with I-5 lane closures for between 1 – 2 months as a result of bridge replacements. Same concern as stated above for item #4. Community Transit would prefer construction requiring I-5 lane closures to occur during late night hours and/or on weekends. If this is not possible, the same mitigation measures should be considered.

9. Page 6-10, Transit Impacts: there will also be negative impacts to Sound Transit Express Bus Route 512, which needs to cross from the left HOV lanes and to the NE 145th St. Freeway Flyer stop: if one-lane general purpose I-5 lane is closed in each direction, this movement will be more difficult affecting service speed and reliability.

10. Page 6-13, Transit Impacts: the narrative should include negative impacts to Community Transit's 400 and 800 series commute service and Sound Transit's 500 series Express Bus service, if the I-5 lane closures are on a 24-hour basis, as opposed to the late night closures. See comments for #4 and #9.

11. Page 6-14, Transit Impacts: see response for comment #10.

12. Page 6-15, General Purpose Traffic Impacts: if possible, Community Transit would prefer the late night and weekend I-5 lane closures as opposed to 24-hour lane closures. Otherwise comment #4 applies.

13. Page 6-15, Transit Impacts: should repeat the General Purpose Traffic Impacts relating to the I-5 closures. See response for comment #4. Again, Community Transit would prefer night time closures that do not disrupt I-5 during weekday AM and PM peak period commutes.

14. Page 6-22, Segment B, Transit Impacts (top of page): see comment #4 regarding I-5 lane closures. Additionally, see comment # 6 relating to the Mountlake Terrace Freeway Station.

15. Page 6-22, Alternative B-1, Transit Impacts (bottom of page): same comment as above #6.

    Reroutes for buses coming from the north to MLT and heading north after stopping at MLT from/to I-5 will have to exit/enter I-5 at 220th Street SW because there are no direct I-5 on or off-ramps on the north side of 236th St SW to the Mountlake Terrace Park and Ride. This will not only inconvenience riders, but increase the cost to provide the service for both Community Transit and Sound Transit. Both agencies may also have to work with the City of Mountlake Terrace to find an alternative bus stop to reduce the total time delay with the inability to use the freeway station.

    Additionally, the second paragraph states bus circulation may be constrained, but not restricting during Alternative B1 construction. Again, any change to stops, reroutes, or other operational changes will have negative impacts to current transit riders, by moving bus

L-012-030

stops, increase in travel time, possible decreases in reliability, and most likely increased costs to provide comparable service.

16. Page 6-23, Alternative B2, Transit Impacts: same comments as #6 relating to the Freeway Station. Additionally, the 1 month closure of 228th St SW will impact at least two Community Transit local bus routes that cross I-5 via the 228th/230th Street SW bridge. This will require significant reroutes because there are limited alternatives for crossing over I-5. Community Transit requests mitigation for this impact.

17. Page 6-24, Alternative B2A: Impacts to transit should be further described beyond, "during construction, transit would experience some delay and bus stops could be temporarily relocated."

18. Page 6-24, Alt 4, Transit Impacts: see comment #6.

19. Pages 6-25 and 6-26, Alt. C-1, Transit Impacts: increase in traffic congestion along 200th Street SW will negatively impact transit operations in and round the Lynnwood Transit Center: increase in delay, decrease in reliability, etc. Community Transit requests mitigation needed to compensate for these impacts to local service, which is also recommended as a mitigation measure for the loss of parking stalls at Lynnwood Transit Center during construction. Mitigation for the loss of parking stalls could also include coordination with Community Transit to enhance the existing Curb the Congestion TDM program.

20. Page 6-27, Alt C-3, Transit Impacts: thank you for minimizing transit impacts by limiting the 46th Avenue W I-5 direct access ramp closures to late nights and weekend. Sound Transit routes will be still be impacted by weekend closures.

21. Page 9-10 Construction Mitigation, Transit: Community Transit requests financial mitigation to provide additional in service, needed to off-set impacts resulting from the construction of the Lynnwood Link Extension to the Lynnwood Transit Center.

22. Page 9-10 Construction Mitigation, Transit: there is no mention of mitigation for the negative impacts to transit resulting from I-5 lane closures. This impacts all agencies currently providing service on I-5 corridor within the project area.

L-012-031

23. Page 9-11, 4th bullet: all communications regarding parking and transit service should be coordinated with Community Transit and King County Metro.

L-012-031

As described in Section 3.6.9 of the Final EIS, transit service modifications would be coordinated with King County Metro, Community Transit, and private transit service providers to minimize construction impacts and disruptions to bus facilities and service.

Swift, Lauren

Subject:	Community Transit - Station ADA Service Accessibility

L-013-001

Community Transit submitted a letter and supporting technical comments on the Lynnwood Link DEIS on 9/23. We would also like to offer additional input reinforcing comments provided by King County Metro in their comment letter regarding ADA paratransit service and accessibility of the Link system.

Link station design should maximize accessibility for all patrons such that Link serves as a viable alternative to expensive ADA paratransit service for the largest possible riding population.

It is also important that Link station design carefully consider proximity and connectivity between rail platforms and parking spaces for ADA paratransit vehicles for passengers that will transfer between light rail and ADA service.

Thank you for considering these additional comments.

Roland Behee
Strategic Planning Unit Manager
Community Transit
(425) 348-2368

1

L-013-001

ADA and paratransit accessibility are part of Sound Transit's commitments for the project, and details will continue to be addressed during further design. The project design will meet or exceed all applicable ADA requirements.

Lauren Swift
Sound Transit Lynnwood Link Draft Environmental Impact Statement
401 S. Jackson Street
Seattle, WA 98104

Dear Ms. Swift:

L-014-001 The King County Department of Transportation (KCDOT) is pleased to submit comments on the Lynnwood Link Draft Environmental Impact Statement (DEIS). King County is a partner with Sound Transit in its mission to expand high capacity transportation across the region and attract more transit ridership. Providing reliable, frequent, rapid, and efficient all-day two-way transit service is an objective we share for the Lynnwood Link extension project.

Since Lynnwood Link light rail extension will affect King County Metro Transit's fixed bus routes, van pools and paratransit services, we have actively participated in this project since its inception and have served as a cooperating agency since September of 2011. King County has provided scoping comments as well as comments on transportation-related discipline reports and the preliminary DEIS. We appreciate that many of our previous comments have been addressed in this document and that our suggestions have helped shape the analysis.

The following comments are offered to support this project by improving the utility of the EIS as a decision-making tool. They focus primarily on segment A of the study area which roughly corresponds to Metro's service area, though our comments also address features of the project located in segments B and C. The following comments are listed under the appropriate section headings. In addition, we have attached technical comments to address more detailed concerns and suggestions.

COMMENT SUMMARY

To improve the value of the FEIS as a decision-making tool, we offer some additional considerations to address in the analysis such as alternatives which place greater emphasis on connecting transit service and non-motorized travel options as a means to access stations, as well as consideration of transit oriented development rather than park-and-ride garages. There should also be acknowledgement of the potential for future tolling and other transportation demand management strategies in the study corridor.

L-014-001

Thank you for your comments and efforts in working on the initial development of the Lynnwood Link Extension, and for the County's continued support for the project.

L-014-002 Regarding the preferred alternative, King County does not have a position on an elevated or at grade profile. King County does support alternatives A10 or A11. Locating a station at NE 130th Street would capitalize on this location's strong transit ridership projections, more efficient local bus connections and superior non-motorized access. King County also prefers a non-freeway median station location at Mountlake Terrace along with suggested design modifications to improve accessibility at the 220th Street SW and Lynnwood stations.

L-014-003 **PURPOSE AND NEED**

The project's Purpose and Need appears to have been revised to be more comprehensive subsequent to previous versions of the document. We suggest addressing frequency in the first bullet on page 1-4, as well as the need for more reliable reverse peak direction transit since reverse peak travel is one of the problems specifically addressed in the transportation analysis. Such a bullet could read:

> *Provide reliable, frequent, rapid, and efficient all-day two-way transit service of sufficient capacity to meet the existing and projected demand for travel to and from the corridor communities and other urban centers in the Central Puget Sound area.*

ALTERNATIVES CONSIDERED

L-014-004 **Link Station Access:**
The analysis should consider a broader set of alternatives with regard to station access. Nearly every alternative and option analyzed by the DEIS proposes a similarly-sized parking garage at most stations. The resulting analysis reduces the utility of the EIS as a decision-making tool, because alternative approaches to station access and their impacts are not measured. The FEIS should evaluate alternatives to large stand-alone park-and-ride garages including increased connecting bus service, enhanced bicycle and pedestrian facilities to improve the transfer experience and transit oriented development. The FEIS needs to measure the impacts of both providing commuter parking and of not providing commuter parking or at least reduced commuter parking.

A string of park-and-ride garages as addressed in the action alternatives would result in a largely automobile-dependent light rail corridor. As shown in the DEIS, these garages would exacerbate local traffic congestion and related impacts, including delays to local and connecting bus service. By contrast, comparably scaled investments in non-motorized access and transit connections would be more consistent with the project's vision, especially as expressed by the last two bullets under 1.2.2 *Need for the Project* on page 1-5. Consideration of this alternative approach to station access in the FEIS would result in a more informative and useful analysis by addressing how ridership and travel time would be affected if comparable investments were made in connecting bus service and non-motorized access to Link stations or additional Link stations (e.g., NE 130th Street and 220th Street SW in Mountlake Terrace).

Including alternatives to park-and-rides in the EIS would also be consistent with Sound Transit's 2012 Transit Oriented Development (TOD) policies. One important goal of the policy is to

L-014-002

The County's comments on Alternatives A10 and A11, which indicate a preference for the NE 130th Street Station, are noted. Sound Transit has continued to explore design modifications for the 220 Street SW and Lynnwood stations, with improved multimodal access being key considerations. The County's preference for a non-freeway station at Mountlake Terrace and suggested design modifications at 220th Street SW and Lynnwood stations are also noted.

L-014-003

The purpose and need statement in Section 1.2 of the Draft EIS was slightly modified based on public comments received during public scoping. FTA and Sound Transit made minor clarifying edits to help simplify the discussion. High frequency service was part of the definition of all alternatives under consideration.

L-014-004

Park-and-ride lots are one of many strategies to maximize transit accessibility, and the Final EIS explores additional parking options at several stations. However, the project already assumes that in many stations, the majority of patrons would be arriving by other modes, particularly transit. The Preferred Alternative also includes improvements in bicycle and pedestrian facilities in station areas and on the streets that would be modified by the project. Sound Transit will continue to explore other modal improvement options as the project advances, in coordination with its partner agencies.

The parking supply described for the alternatives was intended to define the likely upper range of parking that would be provided, which in turn helped estimate the upper range of related impacts such as parking (including potential "hide-and-ride" parking activity), noise, visual impacts, and property requirements. Other details such as the type and

L-014-004 "Encourage convenient, safe multi-modal access to the transit system, with an emphasis on non-motorized access." A focus on TOD rather than park-and-ride garages could provide more all-day ridership, an important question for the EIS to address.

The DEIS analysis predicts an increase of approximately 23,000 riders. The assumptions for this increase must include a significant proportion of transfers from connecting bus service or non-motorized access because the park-and-ride garages will provide access for only a small portion of that increase. The FEIS should provide detail about how that connecting bus service would be supported by Sound Transit's facilities, or provided by Metro and Community Transit.

Regarding pedestrian and bicycle access, the description of the alternatives should address how future light rail passengers will safely and conveniently access the stations on foot or by bicycle. Where will paths or ramps connect to adjacent streets? What kind of bike parking will be provided? How many bike lockers will be provided?

L-014-005 **Support for NE 130th and NE 145th Street Stations:**
King County recommends that the Lead Agency include a station at NE 130th Street in the Preferred Alternative as depicted in Alternative A10 or A11 in addition to the station at 145th. A NE 130th Street station would be approximately mid-way between the Bitter Lake and Lake City Urban Villages in the City of Seattle. A station at NE 130th street would have the advantage of less east-west traffic congestion facilitating reliable local and connecting bus service along with significantly more on and off-street parking capacity as well as fewer accidents.

King County supports a station at NE 145th Street. However, issues with congestion, transit access, and parking will require roadway and pedestrian improvements to the NE 145th street corridor. King County believes that the assumption that there should be 500 car garages at both NE 145th and NE 185th should be carefully analyzed to determine whether it might be better to provide more parking at 185th than congested 145th. King County does not support parking at a NE 130th Station.

L-014-006 **Mountlake Terrace Station:**
King County supports locating a light rail station elsewhere than the I-5 median in order to allow continued transit use of the existing freeway stop by Sound Transit and Community Transit during light rail construction. A non-freeway median station location closer to the Mountlake Terrace town center would also increase light rail ridership in the long run by reducing walking distance and by increasing opportunities for TOD. As documented in greater detail in our attached paratransit comments, riders with impaired mobility would especially benefit from improved proximity, while reducing reliance on costly Access paratransit service.

ADA Accessibility:
L-014-007 Many paratransit trips begin in Snohomish County and end in King County. Therefore, accessibility issues at stations outside Metro's service area can still impact the cost to provide Access paratransit service. This means that facilities not only in King County need to be accessible, but that the whole system is accessible. Building new public transportation infrastructure provides an opportunity to make the system as accessible as possible, while

amount of bicycle parking, and more detailed station access planning will be developed during further design of the stations.

L-014-005
Sound Transit acknowledges the County's preference for a station at NE 130th Street. The Preferred Alternative includes an at-grade and elevated alignment with stations at NE 145th and NE 185th Streets (Alternative A1 with modifications). The Draft EIS also evaluates options for a potential station at NE 130th Street.

L-014-006
The County's preference for the Mountlake Terrace Transit Center station is noted.

L-014-007
All Sound Transit facilities and projects will be designed to meet ADA requirements. Sound Transit will continue to work with King County and its other partner agencies to develop detailed station access plans as the project advances, and this will provide the opportunity to integrate King County's suggestions and further involve you in station design decisions. To address the larger questions regarding paratransit service at a system level, as well as other transit system integration matters, Sound Transit and King County are now collaborating on the Metro Long Range Plan and Sound Transit's Long Range Plan Update and ST3 planning.

L-014-007 employing more costly mitigation measures like paratransit to address the remaining gaps. In order to insure that the system is as accessible and as useful to as many customers as cost-effectively as possible, three key elements should be evaluated:

1. Accessibility of the service;
2. Accessibility of the connections; and
3. Accessibility to destinations served.

We have attached more detailed recommendations for ensuring system-wide accessibility including specific design suggestions for each station alternative to increase the independence of people with disabilities while also reducing the cost of providing paratransit services.

L-014-008 **Transportation Demand Management and Tolling:**
In the evaluation of long-term or cumulative impacts, the FEIS needs to provide a more accurate analysis of likely future conditions consistent with TDM and tolling for the I-5 corridor planned by PSRC and under consideration by WSDOT. PSRC'S adopted *Transportation 2040* plan includes a number of provisions to reduce future traffic congestion on key corridors in the study area and WSDOT is currently in the process of evaluating variable tolling of I-5. As these strategies will reduce traffic congestion and increase transit demand, they will directly affect the performance of all modes using the I-5 corridor, affecting the performance of each alternative and therefore need to be evaluated accordingly.

TRANSPORTATION IMPACTS AND MITIGATION

L-014-009 **Addressing impacts on people with disabilities now and in the future:**
The DEIS evaluates the impact of the project on culturally and linguistically diverse populations and low income populations but does not evaluate the impact on people with disabilities. The FEIS needs to evaluate the project's impact on people with disabilities in order to identify additional aspects of the project that could be altered to increase the benefit of the project to this population.

In addition, the DEIS does not consider the implications of upcoming demographic changes. As the population ages, the transportation needs and abilities of system users will also change. This change increases the need to ensure the new line is built to accommodate the widest variety of abilities and disabilities.

Construction Impacts

L-014-010 The Construction Impacts section (Section 3.3) needs to clarify how construction will impact local bus service and access to bus stops.

L-014-011 KCDOT and Metro will continue to be active partners in the Lynnwood Link project as it moves forward, participating in the SeaShore Transportation Forum and working directly with Sound Transit to optimize integration of our respective transit systems to improve regional mobility and accessibility for all.

L-014-008

The modeling assumptions used for the project were developed in consultation with WSDOT and other cooperating agencies as part of the initial methodology development and scoping phase of the Draft EIS, and the parties agreed that managed and tolled lanes on I-5 should not be assumed for several reasons.

First, the travel demand modeling performed for the Lynnwood Link Extension Final EIS is consistent with the fiscally constrained project list contained in PSRC's Transportation 2040 plan.

Second, there has been very limited development of concepts for I-5 tolling, and the lack of detailed data on the impacts of tolling on the I-5 corridor would make the analysis of impacts related to the light rail project very difficult to accurately assess. (By contrast, at a system level, a limited number of tolled facilities have been assumed outside of the corridor, including I-405 between downtown Bellevue and Lynnwood, SR 520 between I-5 and I-405, I-90 between I-5 and I-405, and the SR 99 tunnel in downtown Seattle, all of which have been or are being examined in other project-level analyses).

Third, future travel conditions without the unfunded managed toll-lane facilities would be a worst-case scenario because the traffic congestion would be worse and transit ridership likely lower than with managed and/or toll facilities. (Sound Transit's Long-Range Plan update and EIS, which is a plan-level document, does assume the regional tolling included in the current PSRC plan, but again its impact analysis and the PSRC plan's information is not location specific.) Appendix A in the Transportation Technical Report provides detailed information about the methodology for the travel demand forecasting analysis.

L-014-009

Sound Transit would not be permanently removing facilities serving

Lauren Swift
September 20, 2013
Page 5

L-014-011 We hope these comments prove helpful as the FEIS is developed. We have attached additional suggestions regarding specific detail on integration of paratransit into station alternatives. We look forward to continuing to work with Sound Transit to refine the project's design and improve its utility for optimizing regional mobility, especially the speed and reliability of public transportation.

Sincerely,

Harold S. Taniguchi, Director
King County Department of Transportation

Attachments

Kevin Desmond, General Manager, Metro Transit Division, KCDOT
Chris Arkills, Transportation Policy Advisor, King County Executive Office

people with disabilities, and the project will be built to meet ADA requirements, with operational and functional improvements in transit service as well as other local transportation facilities. Therefore, no adverse impacts to persons with disabilities has been identified. In many locations, non-ADA compliant facilities such as sidewalks and intersections would be improved, and the project would offer mobility benefits to disabled individuals as well as the general population. The EIS is intended to identify adverse impacts. Sound Transit recognizes that demographic trends indicate a continued increase in the percentage of the overall population that will be senior citizens who may have disabilities; this project would provide an alternative to driving, which would be a benefit.

L-014-010

Sound Transit recognizes the need to support and maintain transit markets during construction. The Draft EIS and the Final EIS both described mitigation measures including TDM/transit elements, with additional operational details to be prepared during final design to minimize impacts related to temporary closures. The Final EIS also provides more definition of the location and duration of closures and their related impacts, as well as minimization measures such as timing closures to be in off-peak periods, evenings, or weekends where possible.

L-014-011

Thank you for your comments and efforts in working on the initial development of the Lynnwood Link Extension.

Lynnwood Link Extension Draft EIS
Paratransit Comments

L-014-012

Background

Access paratransit service is provided to people when they are prevented from riding regular Metro and Sound Transit services by their disability. The service is required by the Americans with Disabilities Act of 1990 (ADA) within three quarters of a mile of all regular (non-commuter) bus services. In Snohomish County, Community Transit's paratransit service is called DART. Sound Transit also has ADA paratransit obligations along Link Light Rail lines. Sound Transit currently contracts with Metro to share the costs of Access service for trips originating and terminating in locations along light rail lines.

The Lynnwood Transit Center is a major paratransit transfer location. Customers traveling between King County and Snohomish County must transfer between Access and DART at this location. If adequate space is not provided at Lynnwood Station, another location would be needed. Any alternate location would need to have good access to I-5 in order to avoid significant impacts on Access's and DART's operational efficiency.

In addition to paratransit services, the ADA encourages transit agencies to enable as many people with disabilities to use their regular transit services as possible. Because of this and the expense of providing paratransit service, Metro works to find ways to move Access riders onto regular transit services. The main strategy used is Conditional Eligibility.

Currently 33 percent of Access customers are conditionally eligible for Access, meaning that they are able to use regular transit services under some conditions. These conditions relate to barriers that prevent them from traveling and can include things like the need for curb cuts and level sidewalks. Access reviews the trips made by conditionally eligible customers to determine whether there is an accessible pathway available on regular transit services. If a pathway is available, then the customer can no longer use Access for that trip.

The current trip review process requires that a trip be completely accessible to a customer from the origin to the destination. One barrier on a single section of a trip results in a customer receiving the entire trip on Access.

Feeder Service

Under ADA legislation, Access can to provide conditionally eligible customers with a ride to a bus stop or train station and then expect customers to complete the rest of their journey on the bus or train.

Sound Transit's Link Light Rail service has reliability and frequency necessary for providing feeder service. As the Sound Transit light rail network continues to expand, a feeder service program will be able to generate significant operational efficiencies. For example, customers traveling to Seattle from Snohomish County could be transported to the Lynnwood Station by DART and then use the light rail to get to the station closest to their destination. If needed, customers could either use bus services or Access for the final segment of their trip.

L-014-012

Sound Transit will design the project to meet ADA requirements, consistent with other federal Sound Transit projects in place or under design now. The station planning programs and Sound Transit design standards incorporate this commitment for effective ADA service, including connections between providers. Further details for each station will be developed during final design in coordination with ADA service providers. More detailed service planning and any service agreements will also be conducted in the later stages of project development as the system approaches operation. However, space for paratransit is generally included in the conceptual plans for the station areas assessed in the EIS. Sound Transit also considered these comments as it updated specific station designs as part of preliminary engineering for the Preferred Alternative, but the level of design used for the EIS remains conceptual to preliminary, and many of the comments involve final design decisions and operational planning, which occur later in the project.

Sound Transit also appreciates the comments regarding persons with disabilities as well as future demographic changes affecting mobility for the general population. Several areas of the EIS address factors that will be important to providing effective ADA access, including the transportation analysis of various modal connections, as well as Section 4.4 Social Impacts, Community Facilities, and Neighborhoods, and Appendix C Environmental Justice Analysis, which incorporate transit-dependent population information from the U.S. Census. More detailed analyses for the purposes of the EIS are not necessary, however, because the project is not removing transit connections without providing improvements in services and facilities that would benefit the general population as well as persons with disabilities. No adverse impacts to persons with disabilities have been identified. However, as Sound Transit initiates final design and conducts more detailed service planning in collaboration with Metro, there will be further

L-014-012

Locating both a feeder site and the transfer site at the Lynnwood Station could further increase operational efficiencies.

Accessible Transit Systems First

When it comes to accessibility, the focus is often on the required paratransit services and then on what changes can be made to improve accessibility to reduce the costs of paratransit. Building new public transportation infrastructure provides an opportunity to focus on making the system as accessible as possible first and then looking at mitigation measures like paratransit for the remaining gaps. In order to insure that the system is as accessible as possible there are three key elements that should be evaluated:

- Accessibility of the service – what can be done to insure that the new rail line is accessible? This includes elements like level boarding, stations layouts that are easy to understand and reliable facilities like elevators and toilets
- Accessibility of the connecting services – what can be done to insure that it is possible to get to and from connecting services at stations? This includes easy access to and between bus zones and paratransit zones as well as adequate facilities at the zones.
- Accessibility to destinations served – what can be done to insure that destinations served by the station are easy to get to? This is particularly important at locations that have or are expected to have transit oriented development. It includes minimizing the distance required to travel to access nearby destinations from the station and making that travel easy and pleasant.

Considering all three elements can help maximize the number of people able to use the new service. This increases the independence of people with disabilities and reduces the need for customers to ever utilize paratransit services, reducing the cost of such services.

Paratransit trips can begin in Snohomish County and end in King County. Accessibility issues at stations outside Metro's service area can still impact the cost of Access paratransit service. This means that it is important that not only facilities in King County be accessible, but that the whole system be accessible.

Please consider the following comments.

Overall:

1. The Lynnwood Link Extension Draft Environmental Impact Statement evaluates the impact of the project on culturally and linguistically diverse populations and low income populations but does not evaluate the impact on people with disabilities. An evaluation of the impact on people with disabilities could identify additional aspects of the project that could be altered to increase the benefit of the project to people with disabilities.
2. Additionally the DEIS does not consider the implications of upcoming demographic changes. As the population ages, the transportation needs and abilities of system users will also change. This change increases the need to insure that the new line is built to accommodate the widest variety of abilities and disabilities.

opportunities to discuss these issues; the Sound Transit System Planning program and the Metro Long Range Plan update also includes additional collaborative efforts to consider these suggestions.

L-014-012

Page	Comment
Appendix F, Sheets 65-71	**N 130th St Station** Metro Accessible Services anticipates using this station as an Access feeder location but not as a major transfer location. For this reason the one paratransit bay provided is adequate. Options 1 & 2 - The elevators to the platform should be in close proximity to the paratransit zones and bus zones. The paratransit zone is currently too far from the bus zones. Having two elevators that provide access to the platform is good because it insures access for customers with disabilities in the event one elevator is not functioning.
Appendix F, Sheets 72-79	**N 145th St Station** Metro Accessible Services anticipates using this station as an Access feeder location but not as a major transfer location. For this reason the one paratransit bay provided is adequate. Option 1 & 2 - NB bus bay is far from station, making access difficult for some customers with disabilities. Having two elevators that provide access to the platform is good because it insures access for customers with disabilities in the event one elevator is not functioning. Option 2, Sheet 76 - If paratransit and SB bus zone could be co-located at the same location as the current paratransit zone it would improve access for customers with disabilities.
Appendix F, Sheets 80-83	**N 155th St** Metro Accessible Services anticipates using this station as an Access feeder location but not as a major transfer location. For this reason the one paratransit bay provided is adequate. However, the current location of paratransit zone is not suitable. The paratransit zone should be located in close proximity to both bus zones and the elevators to the platform. This design provides very easy access for customers with disabilities from bus zones to elevators to platform. Having three elevators that provide access to the platform insures excellent access for customers with disabilities in the event one is not functioning.
Appendix F, Sheets 84-94	**N 185th St** Metro Accessible Services anticipates using this station as an Access feeder location but not as a major transfer location. For this reason the one paratransit bay provided is adequate. Options 1 & 2 - The paratransit zone is well located. Having two elevators that provide access to the platform is good because it insures access for customers with disabilities in the event one elevator is not functioning. Option 3, Sheet 91 - This design appears to require customers to use an elevator when traveling between the paratransit bay and the bus bay in the transit roadway. This is

L-014-012

	not as easy to use as Options 1 and 2. Having two elevators that provide access to each platform is good because it insures access for customers with disabilities in the event one elevator is not functioning. All Options (Sheets 84, 88 & 91) - It is unclear what the pathway is for passengers walking between station and EB bus zone on NE 185th. A N/S crosswalk needs to be provided near the intersection of NE 185th St and the reconstructed 5th Ave NE in order for the EB zone to be usable and safe. If the paratransit bay is moved to enable this crosswalk, it should still be located very close to its current position.
Appendix F, Sheets 95-98	**Mountlake Terrace/236th St SW Transit Center Station** Metro Accessible Services anticipates using this station as an Access feeder location but not as a major transfer location. Metro considered this station as a potential transfer point between Community Transit's DART service and Metro's Access service. However, this location lacks a southbound off ramp and a northbound on ramp to I-5. In addition, the site is space constrained, making it difficult to find enough space for the number of required paratransit zones. For this reason the one paratransit bay provided is adequate for Metro's needs. Sound Transit should also consult with Community Transit in regards to their paratransit needs at this location. The distance between the paratransit zone and the EB bus zone on 236th St SW is further than optimal. Having two elevators that provide access to each platform is good because it insures access for customers with disabilities in the event one elevator is not functioning.
Appendix F, Sheets 99-101	**Mountlake Terrace/236th St SW Freeway Station** The station design lacks a paratransit zone. The distance between the bus zones and the station platform is extremely large. If the station were modified to include a paratransit zone, it would also likely be extremely far from the station platform. This distance is likely to be beyond the capabilities of some customers with disabilities and would may result in additional paratransit usage. The distance may also be large enough that feeder service would not be possible at this station. The additional paratransit operations costs would impact the cost of providing Access and DART and would likely be shared with Sound Transit. Metro Accessible Services recommends that this station option not be selected.
Appendix F, Sheets 102-105	**Mountlake Terrace/220th St SW** Access does not anticipate using the paratransit bay at this station as it is in Snohomish County. However, this station might be an adequate alternate location for transfers between Community Transit's DART service and Metro's Access service. Conducting transfers at this location would reduce the distance that Access vehicles were required to travel in to Snohomish County. Further discussion would be needed between Community Transit, Metro and Sound Transit about whether this location would be a suitable alternative to the Lynnwood Transit Center for paratransit transfers between Access and DART. The station design is unclear about how customers could get from the paratransit bay

L-014-012

	to the WB bus zone on 220th St SW other than via the station platform. Having two elevators that provide access to the platform is good because it insures access for customers with disabilities in the event one elevator is not functioning. Sound Transit should also consult with Community Transit in regards to their paratransit needs at this location.
Appendix F, Sheets 106-121	**Lynnwood Station** *General Comments* The Lynnwood Station is expected to be the most utilized station of the Lynnwood Link Light Rail Extension. This is because this station will be the main point of access to the planned Lynnwood downtown area and it will serve as a major interchange for bus services, with services from Everett expected to terminate here. In addition, the station will also have a large number of parking spaces for customers driving to the station. Each of these elements pulls the station design in a particular direction and balancing the needs of each type of access can be difficult. From an accessibility perspective, the two most important factors at this station are ease of access from the planned downtown and ease of transferring between the rail line and bus services. The 200th St SW option demonstrates prioritizing access to the planned downtown over ease of interchange. The Lynnwood Transit Center Option and the Lynnwood Park and Ride Option 2 both demonstrate the opposite. The Lynnwood Park and Ride Option 1 prioritizes access for car drivers over the other two objectives. In order to maximize accessibility at the Lynnwood Station, Metro Accessible Services requests that Sound Transit consider altering the 200th St SW Station to include a relocated transit center that is immediately adjacent to the station. This option could provide good access to both the planned downtown and to the connecting bus services. This would maximize the accessibility of the station and would help to increase the independence of people with disabilities while also reducing the cost of providing paratransit services. In addition to concerns about the accessibility of the station designs provided in the DEIS, Metro Accessible Services is also concerned about the number of paratransit bays provided in the Lynnwood Station drawings. The Lynnwood Transit Center is the current location of transfers between King County's Access service and Community Transit's DART service. Metro estimates that a total of four paratransit zones would are at this location. In addition, Metro is interested in pursuing feeder service to and from this station. Many paratransit customers may be able to complete much of their journey on light rail. A customer traveling from Snohomish county to a location in Seattle could be dropped off at the Lynnwood Station by DART and then picked up by Access at the Link station closest to their destination. This could result in a significant reduction in the cost of providing paratransit service. In order for this service to work, it is extremely important that paratransit bays be close to the to the Link Station so that

L-014-012	customers can easily get from DART to the light rail. Building a Lynnwood Station that has paratransit zones that can serve both as a feeder location and as a transfer location between paratransit services would allow for both Access and DART to maximize operational efficiencies. Paratransit shelter – Current transfer operations are conducted on a hand to hand basis. This means that no customers transferring between DART and Access are ever left alone. If the connecting vehicle is late, then the first vehicle must wait until it arrives to hand off the customer. This process adds an approximate 1,041 service hours annually to Access service, costing $58,608. This policy likely adds a similar amount to DART's costs. Metro Accessible Services is interested in examining solutions to allow the transfer of customers between services without requiring vans to wait for the connecting vehicle. In order for paratransit vehicles to be able to drop customers off to wait for their connection, two issues would need to be resolved: protection from the elements and hand to hand service. Some paratransit customers are particularly vulnerable to the elements. In order to be able to drop of customers, a shelter with radiant heating and wind protection on four sides would be required. This shelter could also be incorporated into shopping/commercial facilities at the station, similar to those in the 200th St SW Option. The facilities would need to be close to the paratransit zone and would also be useful for feeder trips if they were located close to the station platform and the bus zones. The current system of providing hand to hand service was originally set up because some paratransit customers cannot be left alone. Currently 8% of the customers switching between Access and DART at the Lynnwood Transit Center require hand to hand service. Hand to hand service is not something that is required by the ADA, and it may be possible to identify partner agencies that could assist with these trips. In addition to the estimated savings from not providing hand to hand transfer service, Access estimates that the number of paratransit bays at the Lynnwood Station could be reduced to two bays from the four that would otherwise be required. [this is subject to further consultation with Community Transit] *Lynnwood Station Option Specific Comments:* **200th St SW Option**, sheets 106-109 - The distance between the paratransit zone, the bus zones and the station are significant and could impact the ability of customers with disabilities to transfer between services. The proposed design appears to prioritize the access of drivers using the parking garage over other modes of transportation. Having two elevators that provide access to the platform is good because it insures access for customers with disabilities in the event one elevator is not functioning.

L-014-012

	The number of paratransit zones provided is inadequate to maintain the current paratransit transfer operations. **Lynnwood Transit Center Option**, sheets 110-113 - The distance between the paratransit zone and the station and bus zones is adequate in this station design. Having two elevators that provide access to the platform is good because it insures access for customers with disabilities in the event one elevator is not functioning. The number of paratransit zones provided is inadequate to maintain the current paratransit transfer operations. **Lynnwood Park and Ride Option 1**, sheets 114-117 - The bus zones are far removed from the station and paratransit zone, making it difficult for customers with disabilities to transfer between Link and local bus service. This could increase the need for customers to use paratransit, increasing the operations costs for Sound Transit, Community Transit and Metro. Requiring customers to cross both 46th Ave SW and the Kiss and Ride access road may also discourage customers from making the required interchange, particularly those with disabilities. Having two elevators that provide access to the platform is good because it insures access for customers with disabilities in the event one elevator is not functioning. The number of paratransit zones provided is inadequate to maintain the current paratransit transfer operations. **Lynnwood Park and Ride Option 2**, sheets 118-121 – The paratransit zone is separated from the bus zones. Customers transferring from paratransit services to bus services would need to travel a significant distance, including taking an elevator to the platform, traveling to the other elevator and then taking that one to the bus bays. Paratransit to bus connections would therefore be reliant on both elevators being in working order. Additionally, the lack of a crosswalk between the station island and the paratransit bay/kiss and ride area means that if the elevator on the south end of the station is out of order, customers will be forced to cross the transit roadway in an area without a marked crosswalk. The number of paratransit zones provided is inadequate to maintain the current paratransit transfer operations.

Subject: Lynnwood Link Extension *Draft Environmental Impact Statement*

Dear Ms. Swift,

L-015-001

The Puget Sound Regional Council (PSRC) appreciates the opportunity to comment on the Lynnwood Link Extension *Draft Environmental Impact Statement* (DEIS) documents. Implementation of high-capacity transit to support growing communities is fundamental to the success of VISION 2040, the region's integrated long-range strategy for growth management, transportation and economic development. In addition, the *Growing Transit Communities Partnership,* housed at PSRC, focuses on developing equitable transit communities at station areas within this, and other, corridors. Accordingly, the PSRC has an on-going interest in transit system planning for the Northgate-Lynnwood corridor and has been designated as a Participating Agency in the project.

We commend Sound Transit for their work on the Lynnwood Link Extension Project to date and specifically the DEIS effort. The scope of the Lynnwood Link Extension DEIS spans the many growth management, transportation and economic development arenas for which the Puget Sound Regional Council oversees long-range regional planning. The DEIS has therefore been reviewed by transit planning, transportation modeling, and growth management department staff. That review found consistency with long-range planning documents and general agreement with the specific methodologies used to evaluate the impacts and benefits of different stations.

We do wish to make two primary recommendations moving forward with the final Environmental Impact Statement, on which we elaborate later in this letter:

- Develop a finer-grained measure to differentiate TOD potential between station locations and provide greater transparency on how qualitative rankings were assigned.
- Provide station access data by mode and clearly define how those different modes feed into the potential ridership calculation.

We commend Sound Transit on the effort made in the Lynnwood Link DEIS to examine and qualify the varying levels of TOD potential that different station areas and specific station locations offer. This new effort acknowledges the critical link between land use and transit investments to support the region's growth strategy and support transit ridership. In addition, it sets an important precedent for Sound Transit's future system planning efforts.

L-015-001

The Draft EIS and Final EIS summarize Sound Transit's assessment of transit-oriented development (TOD) potential in Table 4.2-3; this is based on the *Station Area Transit-Oriented Development Potential Report* conducted to support station area and project planning. The report was updated as part of the continued planning for the project during preliminary engineering and environmental analysis. A copy of the *Station Area Transit-Oriented Development Potential Report* is available through on the Sound Transit Website for the project at http://www.soundtransit.org/Projects-and-Plans/Lynnwood-Link-Extension/Lynnwood-Link-Document-Archive.

Based on comments from the Sound Transit Board and other parties, the level of information and the methods used were effective in highlighting the relative differences between station choices. The level of detail on TOD potential is consistent with Sound Transit practices for other recent Sound Transit EISs and appropriate at the EIS phase for comparing alternatives. The assessment is summarized to help determine the likelihood that the project could indirectly impact land use and other environmental conditions, as well as to consider whether it helped support land use plans and policies.

The Transportation Technical Report for the Final EIS has additional discussion of mode choice for accessing station areas, as well as more information on parking and other station access factors, including the relative accessibility of various station alternatives by all modes. The model results do not lend themselves directly to detailed analysis by mode, and instead are provided as an indication of likely ridership levels given surrounding land use, including future population and employment levels, existing transit use, and connecting transportation facilities. Further calculations of access by mode would be done during final design.

L-015-002 In the PSRC's comments on the North Corridor Transit Project Alternatives Analysis (2011), we requested that the DEIS consider the following three points that relate directly to ridership from station access and station area TOD:

- *"Ridership Potential:* The Alternatives Analysis Report provides overall ridership numbers for considered alternatives. PSRC suggests that the EIS segregate the potential ridership data by access mode (pedestrian, bicycle, transit transfer, car) for each station and include estimates on potential ridership that future transit-oriented growth could generate.
- *Transit Service Accessibility:* The Alternatives Analysis Report assigned the same rating of "moderate" to all three light rail alternatives for all modes of access (pedestrian, bus, bicycle, and park and ride). The EIS should provide a finer-grained measure, defined by a scale of five or ten rather than three, or use a more nuanced metric, in order to better differentiate between the alternatives.
- *Station Siting Considered in Draft EIS:* PSRC suggests that station siting effects on local planning efforts be carefully considered in the EIS. For example, proposed station areas should be located proximate to areas designated for high intensity transit-oriented development wherever possible. In addition, the siting of the northern terminus of the North Corridor Transit Project in Lynnwood should support various alignment alternatives of the high capacity transit corridor between Lynnwood and Everett that Sound Transit will consider in the future."

L-015-003 These requests were further supported by the final recommendations that emerged from the *Growing Transit Communities Partnership* in July 2013. One of the 24 Strategies recommended by the GTC Partnership was "Locate, Design and Provide Access to Transit Stations to Support TOD." The Strategy specifically calls for the following actions from transit agencies:

- Action 8.2: Strengthen criteria for selecting transit alignments and station locations to include TOD potential alongside other criteria such as environmental impacts, costs, and ridership potential. TOD potential should reflect both existing and planned uses and densities within transit station areas.
- Action 8.4: Design stations to provide multimodal access to transit, including on foot, bicycle, and via connections with other transit services.
- Action 8.5: Implement transit access and parking management strategies that support and encourage access via multiple modes of travel to the transit system, and that provide alternatives to automobile travel through approaches, such as: transit service connections to surrounding neighborhoods, bicycle and pedestrian connections, and demand management strategies (e.g., parking fees).

We commend Sound Transit for the *Station Area Transit-Oriented Development Potential Report* (April 2013) that the agency completed to support the Land Use portion of the Lynnwood Link Extension DEIS. The TOD Potential Report considered many of the issues raised in the PSRC comments and GTC Partnership recommendations noted above, including an examination and comparison of station areas based on criteria such as existing station conditions, station area character, station access, and potential development opportunities. We feel that these are critically important criteria inform station location decisions that best support existing communities and future residential and employment growth. Together with the recently board-adopted TOD Policy, this work sets an important new precedent for the agency to strengthen their consideration of TOD Potential in system planning and development.

We do however feel that the final EIS, as well as future system planning and development processes, should do more to make clear and explicit the consideration of TOD development potential and multi-modal access in the final EIS and future system planning and development processes. We make the following

L-015-002

Sound Transit considered the suggestions of the PSRC as it developed the methods for the EIS, and Sound Transit circulated methodology reports for the EIS to participating agencies for comment following the project NEPA/SEPA scoping period. It is important to note that the tiered approach to the Alternatives Analysis was by nature better suited to the use of evaluation criteria and ratings because it was conducted to help identify, refine, and narrow a wider range of modal and corridor options, including station sites.

For the EIS, the definitions of alternatives and their features were better established from the outset. Measures such as ridership potential and access could be more directly defined as part of the alternative designs and also considered through the application of Sound Transit's forecasting model. The alternatives under consideration were also similar in their locations and the markets served, and primarily involved siting and design choices, so qualitative measures did not tend to markedly differentiate the alternatives. Therefore, the use of detailed ratings in the Final EIS was limited; instead, the analysis focused on identifying areas of impact and describing mitigation where appropriate.

The discussion of Land Use in Section 4.2 included an assessment of consistency with planning policies (Appendix I-4.2), which noted areas where stations were located near where local plans or policies anticipated high capacity transit (HCT) or they at least contemplated increased densities; however, most jurisdictions make HCT-oriented designations after HCT projects are in the planning and design stages rather than before.

Finally, Section 2.5 described the key factors considered in developing alignment and station combinations; while land use conditions were an important factor, so were the placement of an alignment relative to

L-015-003

recommendations, consistent with our comments on the North Corridor Transit Project Alternatives Analysis and the recommendations of the Growing Transit Communities Partnership.

Develop a finer-grained measure to differentiate TOD potential between station locations and provide greater transparency on how qualitative rankings were assigned. While the qualitative scales of "limited-moderate-strong" TOD potential have the potential to be useful, they do not seem to always accurately reflect the station conditions described in the DEIS. In many cases, station locations that seem to perform differently on sub-measures were assigned the same value on the scale. In one example of this, the three station locations proposed for the Lynnwood Transit Center performed identically for existing conditions (limited-moderate). However, for the factors that comprised existing conditions, the 200th Street SW station clearly outperformed the other two station locations on two factors (population and employment, and existing station area character) and performed equally on the third factor (balance of mix of uses). Because the TOD Potential Report does not provide a definition for what specifically constitute a score of "limited" versus "moderate" versus "strong," it is not possible to discern why these differing performances yielded the same designation. We recommend a more clearly defined and transparent methodology, as well as use of finer-grained measures that better differentiate between station locations. A forced ranking (e.g., 1st, 2nd, 3rd) of potential station locations for different measures would also provide a way to better compare relative performance.

Provide station access data by mode and clearly define how those different modes feed into the potential ridership calculation. The TOD Potential Report provides data on station access within the 15-minute walk and bicycle sheds. It is not clear how this information informs ridership projections. The detailed modal access data is not presented in the discussions of ridership in the main document of the DEIS. In order to be consistent with the intent of regional policy to promote multi-modal mobility and Sound Transit's recently adopted Station Access policy that strengthens non-vehicular station access, it is important that system planning and development analyses carefully examine and disclose the levels of multi-modal access that different station locations may provide. We recommend that this data be better called out in the final EIS and, similar to the previous comment, be explicitly used to differentiate among station locations or alignments. Without better disclosure of how these analyses are performed and function, the value of the information is significantly diminished.

The Lynnwood Link Extension is an important long-range investment for our region. We commend Sound Transit again for the DEIS effort, and especially for the strengthened consideration of TOD potential. We appreciate the opportunity to comment and participate. If you have any questions regarding our comments, please contact me at (206) 971-3288 or snikolic@psrc.org, or our SEPA Responsible Official, Ivan Miller, at (206) 464-7549 or imiller@psrc.org.

Sincerely,

Sara Schott Nikolic, Principal Planner
Puget Sound Regional Council

Ivan W. Miller, SEPA Responsible Official
Puget Sound Regional Council

Gil Cerise, Senior Transit Planner

available rights-of-way, topographical challenges, and built and natural environmental features.

L-015-003

The *Station Area Transit-Oriented Development Potential Report* was prepared by Sound Transit to help differentiate station options with respect to future development potential and is primarily based on existing conditions. This work was conducted while PSRC's Growing Transit Communities Partnership (GTC) efforts were underway and Sound Transit reviewed and coordinated work accordingly. As noted in the comments above, the EIS is intended to disclose potential impacts that could occur with the development of the project alternatives, and to explore measures that would avoid, minimize, or mitigate impacts.

Sound Transit agrees that assessments of TOD as well as access are important elements of planning for stations, and the TOD report was available to the Board and the public prior to the identification of the Preferred Alternative. The updated report is similarly available along with the Final EIS; the EIS is not the only source of information that Board members consider in their decision-making. In addition, as described in Chapter 2 of the Draft EIS and the supporting Alternatives Analysis completed in 2011, Sound Transit considered TOD, access and other issues in detail along with a wide range of other factors as it defined the light rail alignment and station alternatives for the EIS.

Log: 100611-07-FTA
Property: Sound Transit's Lynnwood Link Extension Light Rail Project
Re: Receipt of Draft Environmental Impact Statement, No Adverse Effect

Dear Mr. Feldman:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP). The Lynnwood Link Extension Light Rail project has been reviewed on behalf of the State Historic Preservation Officer under provisions of Section 106 of the National Historic Preservation Act of 1966 (as amended) and 36 CFR Part 800. My review is based upon documentation contained in your communication.

S-001-001 Thank you for submitting the draft Environmental Impact Statement Summary. We have reviewed the document and concur with your preliminary finding that the project, as described, will have no adverse effect on historic properties and/or archaeological sites within the area of potential effects identified for the project.

If additional information on the project becomes available, construction plans are altered, or if any archaeological resources are uncovered during construction, please halt work in the area of discovery and contact the appropriate Native American Tribes and DAHP for further consultation.

Thank you for the opportunity to review and comment. If you have any questions, please contact me.

Sincerely,

Matthew Sterner, M.A.
Transportation Archaeologist

Sound Transit
Draft EIS Comments, c/o Lauren Swift
401 S. Jackson St., Seattle, WA 98104

To the Sound Transit Board:

S-002-001

We are writing to express our concern for the future of the Latvian Community Center, located at 17710 - 3rd Avenue Northeast. As you know, the Center's activities will be affected by the light rail extension that is planned along Interstate 5.

The University of Washington's Department of Scandinavian Studies maintains close ties to Seattle's Latvian, Estonian, and Lithuanian communities, who all organize many events at the Latvian Center. Students and instructors in UW's international studies programs attend concerts, lectures, films, and theater performances, to learn about these countries and their people. Student tickets and parking are inexpensive (much cheaper than flying to the countries!), because the Center is owned by the Latvian community. The Scandinavian Department's Baltic Studies Program is the only program in the United States to teach Estonian, Latvian, and Lithuanian, three languages that are often spoken at Latvian Center events where UW's foreign language students can practice their language skills.

The UW Scandinavian Department also organizes events at the Latvian Center. The Center's central location, parking lot, and kitchen facilities make it an ideal place for community outreach activities such as our annual "Baltic Saint Martin's Day" celebration, lectures, and other events that UW co-hosts with community organizations.

For the next few years, construction of the light rail line will disrupt these educational events for our students and faculty, as well as UW community outreach opportunities at the Latvian Center. We hope that when construction is finished, the Latvian Center will be able to continue hosting the vibrant cultural life that enriches the education of our students and teachers and off-campus communities.

We hope that representatives of Sound Transit will be able to attend the UW Baltic Program's "Martin's Day" celebration on October 26, 2013, to see for themselves that the Latvian Center is an incredible gift to the Seattle community. We hope that Sound Transit will take every possible step to ensure that the Center can continue its activities during and after light rail construction.

Please contact the Department of Scandinavian Studies if further information is needed.

Sincerely,

Jan Sjåvik, Chair

Guntis Šmidchens, Associate Professor

S-002-001

Thank you for describing the linkage between the University of Washington's Department of Scandinavian Studies and the Seattle Latvian Evangelical Lutheran Church. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Although construction activities will be adjacent to the church, Sound Transit will work closely with the church to maintain access, minimize parking loss, and reduce other potential construction disruptions to ongoing church and center activities. The primary construction in the area would be ongoing for 1-2 years in the area, but major construction activities would be shorter duration. For temporary impacts such as truck traffic, detours, noise, dust, light and glare, Sound Transit proposes best management practices to avoid and minimize impacts in Sections 3.6, 4.5.7, 4.6.7, and 4.7.7. The construction area would also be fenced to protect public safety, and the church would have a direct contact at Sound Transit to discuss any issues of concern.

Sound Transit
Union Station
401 S. Jackson Street
Seattle, WA 98104-2826

Dear Joni:

S-003-001

Thank you for the opportunity to comment on the Draft Environmental Impact Statement (DEIS) for the Lynnwood Link Extension we received on July 18, 2013. The Washington State Department of Transportation (WSDOT) strongly supports the extension of light rail to Lynnwood. As we work with our partners to develop an integrated transportation system for the 21st century, it is important to provide multiple mode choices to people trying to reach destinations in congested travel corridors like Interstate 5 (I-5). The Lynnwood Link Extension project will add much-needed capacity for moving people in the I-5 corridor and ultimately allow the entire transportation system to function better.

WSDOT has been working closely with Sound Transit on the development of the light rail extension to Lynnwood. As a result of our close coordination, we consider all of the alternatives being evaluated for this project to be viable choices and do not have a preference. We look forward to continuing to collaborate with Sound Transit on the design of the project after a Preferred Alternative is identified.

As we work together during final design, WSDOT will be focused on maintaining safety and also on ensuring that the project effectively blends into the overall transportation system. In particular, optimizing access to stations through improvements to non-motorized transportation modes is a high priority to us. We are confident that we will be able to work with Sound Transit and local jurisdictions to develop effective solutions.

Overall, we feel that the Draft EIS was thorough and well done. After conducting a review, we think there are a few areas that should be improved as the Final EIS is developed. The points we'd like to highlight are identified below. We will be sending detailed comments separately.

S-003-002

Transportation
Keeping WSDOT freeway management infrastructure on I-5 operational throughout construction is very important. This includes ensuring the closed-circuit television system, variable message signs, data stations, and ramp meters stay operational, with

S-003-001

Thank you for your efforts in working on the initial development of the Lynnwood Link Extension and for WSDOT's support for the project.

S-003-002

Sound Transit assumes that the I-5 freeway management systems will need to be operational through construction in order to help ease impacts of the construction. The Final EIS clarifies this assumption in Chapter 3, Transportation, Section 3.3. Sound Transit will continue to coordinate with WSDOT to develop a detailed approach.

S-003-002

reconfiguration as needed. A commitment to do this is in the Transportation Technical Report, but it should be among the mitigation commitments in the Final EIS and ultimately the Record of Decision.

S-003-003

Visual Resources

The analysis of visual and aesthetic resources is improved since our previous review, but we have identified further changes that should be made in the Final EIS to provide the robust analysis needed for the project. These changes are enumerated in the detailed comments we are providing. In general, we think that the degree of change to visual resources is understated for a number of locations and the analysis would benefit from greater clarity. However, this does not change the overall conclusion in the Draft EIS that virtually all of the alternative in each segment of the project will have some high impacts to visual resources.

Regarding mitigation for visual resources, we appreciate that Sound Transit acknowledges the need to mitigate for impacts to areas acquired under the Highway Beautification Act of 1965 with replacement land. However, the Final EIS should also note that Sound Transit will be required to mitigate for the loss of vegetation within WSDOT right of way per our roadside policies. We would like the loss of vegetation, particularly the large trees, minimized as much as practicable.

We look forward to working with Sound Transit on the final design and implementation of this important project. Thank you again for the opportunity to review and comment on the Draft EIS.

Sincerely,

Brian Lagerberg
Public Transportation Director

Lorena Eng, P.E.
Northwest Region Administrator
Washington State Department of Transportation

cc: Lauren Swift, Sound Transit

S-003-003

Section 4.5 of the Final EIS includes revisions and clarifications to the assessment of visual impacts based on specific comments by WSDOT.

The Final EIS also provides updated discussion about Sound Transit's approaches to minimize the loss of vegetation, particularly large trees, to the extent feasible, with details to be defined during final design in consultation with WSDOT. Sound Transit understands the necessity to mitigate loss of vegetation consistent with WSDOT roadside policies and to mitigate impacts to areas acquired under the Highway Beautification Act. Sound Transit will work with WSDOT to accomplish this.

RE: Lynnwood Link Extension Draft Environmental Impact Statement

Sent via e-mail

Dear Ms. Swift:

I would like to thank you for providing the Department of Ecology (Ecology) an opportunity to comment on the Lynnwood Link Extension Draft Environmental Impact Statement (DEIS). The Lynnwood Link Extension would extend light rail service from north Seattle to Lynnwood in Snohomish County. Ecology offers the following comments for the record as Sound Transit moves forward with planning for this project, which has the potential to significantly reduce traffic congestion and improve options for commuters.

S-004-001 The DEIS is a well-written and comprehensive review of the potential environmental impacts of the project. For consistency with the State Environmental Policy Act implementing rules (WAC 197-11-768) and state and federal standards in reviewing potential wetland impacts, avoidance and minimization are the first two steps in assessing potential impacts. Therefore, Ecology supports the alternatives that avoid and minimize impacts to wetlands and streams in the project corridor. While we realize this is a linear transportation project in a densely urban area, the Scriber Creek wetland complex (Wetland WLY4), the largest and highest functioning wetland in the project corridor, still provides some important habitat and stream support. There are options described in the DEIS that reduce potential impacts to this ecologically valuable resource. Ecology supports Alternatives C1 or C3 due to the reduced impacts to Wetland WLY4.

S-004-002 As the project design progresses, the wetlands potentially impacted by project construction will need to be delineated and rated, consistent with the current state and federal delineation and rating standards. The wetland boundaries and ratings will need to be field verified by agency staff. As described in the DEIS, it appears that the proposed wetland fill will require and individual Water Quality Certification (WQC) from Ecology. To avoid delays in project review and approval, we would recommend that applications be submitted to Ecology and the U.S. Army Corps of Engineers early in design process once the final alignment is selected. Ecology

S-004-001

The Preferred Alternative is a modified C3, which has slightly more impacts to wetlands, but also better balances other impacts and benefits. This project will abide by all applicable federal, state, and local environmental laws and regulations. Sound Transit's policy on ecosystem mitigation is to avoid impacts on environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure no net loss of ecosystem function and acreage as a result of agency projects. The Lynnwood Link Extension would mitigate impacts on ecosystem resources in accordance with the mitigation sequencing requirements established by NEPA, SEPA, the Clean Water Act, and local critical areas ordinances. The Preferred Alternative design in the Final EIS has an alignment as well as structural and construction elements that help avoid and minimize impacts; the Final EIS also describes other mitigation that would be further defined during final design and permitting, including seeking mitigation opportunities within the Scriber Creek wetland complex.

S-004-002

All wetlands that may be affected by the Preferred Alternative will be delineated consistent with state and federal delineation standards, and wetland ratings will be updated as needed. Sound Transit will coordinate with regulatory agencies during permitting. Thank you for your offer of assistance during the application process.

S-004-002 staff would be happy to assist Sound Transit should you have any questions on the state application and approval process.

Specific comments on the DEIS include the following:

S-004-003 § 4.8.2, p. 4-135 The DEIS indicates that the Scriber Creek ordinary high water mark (OHWM) was not discernible within the Scriber Creek wetland complex. In these situations the OHWM is often located at the outer channels during ordinary high flow events. Ecology would be happy to assist Sound Transit in refining the OHWM for the final environmental impact statement (FEIS).

S-004-004 Also on p. 4-135, DEIS states that stormwater flow control and treatment will comply with all local stormwater standards but that project may result in increased flows or duration of stormwater input to receiving waters. As mentioned, the proposed wetland impacts listed in the DEIS will require state authorization and likely an individual WQC. As part of the WQC approval, the project will need to be designed to meet the current state stormwater manual and consistent with the stormwater treatment and flow control standards for discharges to waters of the state, including wetlands.

S-004-005 § 4.8.6, p. 4-146 The section discussing compensatory mitigation mentions the possible use of available approved mitigation banks as a mitigation option. There are currently no approved wetland mitigation banks within the project area.

S-004-006 § 4.8.6, p. 4-147 The possibility of onsite mitigation within the Scriber Creek wetland complex (Wetland WLY4) is mentioned. Ecology would support a consolidated mitigation approach at this site due to the potential benefit to Scriber Creek and salmonids. The mitigation site will need to have adequate buffers and long-term protection consistent with state and federal guidance.

S-004-007 § 4.9, p. 4-151 Relative to management under the state Shoreline Management Act (RCW 90.58; SMA), the DESI states that Ecology has delegated authority to regulate designated shorelines to the local jurisdictions. As a point of clarification, Ecology is the state agency that jointly administers the SMA along with the local jurisdictions. Ballinger Lake is apparently the only shoreline within the project area, but lakes are the only shoreline waters that need to be formally designated within the local jurisdiction's Shoreline Master Program. All other shoreline waters (tidal waters and streams with a mean annual flow greater than 20 cubic feet/second) and associated wetlands are under SMA jurisdiction whether or not they have been formally designated.

We look forward to continuing to work with Sound Transit on this important transportation project and to reviewing the FEIS. We would be happy to assist Sound Transit in any way that we can during the design and permitting of the Lynnwood Link Extension. If you have any questions or would like to discuss my comments, please give me a call at (425) 649 7148 or send an email to paan461@ecy.wa.gov.

S-004-003

Thank you for the offer to assist with the OHWM determination for Scriber Creek in the wetland complex.

S-004-004

Thank you for your comment. Sound Transit will comply with all applicable certifications and design standards, including Clean Water Act Section 401 Water Quality Certification and the Washington State Department of Ecology (Ecology) Stormwater Manual for Western Washington.

S-004-005

It is correct that there are no approved mitgation banks with service areas in the project area. The referenced statement is included to not preclude the opportunity to use any future mitigation banks that may have a service area within the project area.

S-004-006

If project-specific mitigation is developed for this project, site selection would emphasize a watershed approach to consolidate compensatory mitigation sites. Plans would be developed in cooperation with resource agencies.

S-004-007

Thank you for your comment. The text of the Final EIS has been updated to clarify the roles of Ecology and the City of Mountlake Terrace with regard to Lake Ballinger shoreline regulation.

Sincerely,

Paul S. Anderson, PWS
Wetland Specialist

To: Lynnwood Link DEIS
Subject: Lynnwood Link Extension DEIS

Lauren and Dan,
We have reviewed the Draft EIS and the associated appendices for the proposed Lynnwood Link Extension project proposed by Sound Transit and the Federal Transit Administration. In general, it appears that many of our previous comments on the Ecosystem Section analyses have been incorporated into the DEIS and the Ecosystems Technical Report.

We do have a couple of comments on these documents as noted below:

T-001-001 1. It appears that Alternative C1 would have the fewest impacts upon Scriber Creek, a Swamp Creek tributary, associated wetlands and its associated floodplain based on the information in the DEIS. As a result, this sub-alternative would likely have the fewest impacts to salmon and their habitat and would be preferred.

T-001-002 2. In Section 4.8.2, Cumulative Impacts, there is a sentence indicating that Sound Transit would work with WSDOT to coordinate any design work that may impact WSDOT/WDFW culvert replacement projects. Please note that these state-owned culverts are likely subject to the recent Federal Court decisions regarding state-owned culverts and at a minimum would need to also include the Muckleshoot Indian Tribe Fisheries Division on these coordination discussions and design considerations.

T-001-003 3. As there are some unavoidable impacts to streams, floodplains, wetlands and buffers, we request the opportunity to work closely with Sound Transit and FTA as the project undergoes further design and mitigation plan development.

T-001-004 4. For any pollution generated surfaces that require stormwater water quality treatment methods, we recommend that enhanced treatment methods be used to maximize the removal of heavy metals and oils from stormwater that may otherwise adversely affect salmon in the receiving water bodies.

We appreciate the opportunity to review this proposal. Please let me know if you have any questions.

Thank you,
Karen Walter
Watersheds and Land Use Team Leader

Muckleshoot Indian Tribe Fisheries Division Habitat Program
39015 172nd Ave SE
Auburn, WA 98092
253-876-3116

1

T-001-001
Thank you for your comment stating a preference for Alternative C1 and the reasons for your preference.

T-001-002
Sound Transit will coordinate with the Muckleshoot Indian Tribe Fisheries Division regarding final design work that may impact WSDOT/WDFW culvert replacement projects.

T-001-003
Sound Transit will coordinate with the Muckleshoot Indian Tribe Fisheries Division during final design, and the tribe will be invited to participate in the permitting process.

T-001-004
All Sound Transit projects must mitigate any unavoidable impacts to ensure that they do not reduce ecosystem function or acreage. (See Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit [2007]). In addition, all Sound Transit projects must consider low-impact development (LID) methods, which often include technologies that maximize the removal of heavy metals and oils from stormwater, as a first choice for stormwater treatment. The Lynnwood Link Extension design team will review the feasibility of LID strategies as the Preferred Alternative design advances and, if necessary, will use other methods to protect water quality.

Preface

Part 1 of this report was prepared by Historical Research Associates, Inc. (HRA) Project Archaeologist Shari Maria Silverman, M.A., M.S.; Research Archaeologist Jenny Dellert, M.A.; Archaeological Technician Anthony Cagle, PhD; and HRA Principal Investigator Brent A Hicks, M.A., R.P.A., who meet the Secretary of the Interior's professional qualifications standards for archaeology. This report is intended for the exclusive use of the client and its representatives. It contains professional conclusions and recommendations concerning the potential for project-related effects to archaeological resources based on the results of HRA's investigation. It should not be considered to constitute project clearance with regard to the treatment of cultural resources or permission to proceed with the project described in lieu of review by the appropriate reviewing or permitting agency. This report should be submitted to the appropriate state and local review agencies for their comments prior to the commencement of the project.

Part 2, the built environment, was prepared by Mimi Sheridan, AICP, who meets the Secretary of Interior's professional qualification standards for architectural history and history.

Executive Summary

The Central Puget Sound Regional Transit Authority (Sound Transit) and the Federal Transit Administration (FTA) have prepared this technical report to support the environmental impact statement (EIS) for the Lynnwood Link Extension in compliance with the National Environmental Policy Act (NEPA) and the Washington State Environmental Policy Act (SEPA). FTA is the federal lead agency for the NEPA EIS process, and Sound Transit is the state lead agency for SEPA. This technical report is also designed to support the requirements of Section 106 of the National Historic Preservation Act (NHPA), which requires federal agencies to take into account the effect of their undertakings on historic properties.

Historic properties are defined in 36 Code of Federal Regulations (CFR) 800.16(l)(1) as "any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior," and can also include traditional cultural properties (TCPs). Historic properties are identified and evaluated in consultation with the State Historic Preservation Officer (SHPO) at the Washington State Department of Archaeology and Historic Preservation (DAHP), tribes with jurisdiction or interest, local jurisdictions—the Cities of Seattle, Shoreline, Mountlake Terrace and Lynnwood—and other consulting parties.

To be eligible for National Register of Historic Places (NRHP) listing, a historic resource must meet standards of integrity and at least one of the following criteria (36 Code of Federal Regulations [CFR] 60.4):

A. Is associated with an important event or series of events that have made a significant contribution to the broad patterns of American history;
B. Is associated with an important individual who was significant in our past;
C. Embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master or possesses high artistic values; or represents a significant and distinguishable entity whose components lack individual distinction; or
D. Has yielded, or may be likely to yield, information important in history or prehistory.

Regulations in 36 CFR 800 outline the process for satisfying the Section 106 requirements. The process includes the following steps: (1) initiate consultation with regulatory agencies, tribes with jurisdiction or interest, local governments, and other interested parties; (2) define the Area of Potential Effects (APE); (3) identify, record, and evaluate resources for potential NRHP eligibility; (4) identify project effects; and (5) consult with affected parties to resolve adverse effects, if any, on historic properties.

This report has been prepared in two parts and presents the methods, results, conclusions, and recommendations for conducting an inventory and evaluation of historic properties within the project APE. Part 1 (Chapters 1 through 5) includes all work conducted to identify, evaluate, and assess potential archaeological resources and TCPs; Part 2 (Chapters 6 through 10) presents the

methods and results of the identification and evaluation process for historic built environment resources within the APE and also includes an effects assessment and potential mitigation measures.

Summary of Findings

Archaeological Resources and TCPs

No NRHP-eligible archaeological resources or TCPs have been identified within the project APE. Archaeologists conducted an initial archaeological field survey in 2012, targeting locations within the APE that had some potential for having intact archaeological deposits. Most of the APE has been highly disturbed in recent decades due to roadway construction and residential development; as a result, the overall APE has a low to moderate probability for intact archaeological remains.

Two historic-period archaeological sites (the Seattle–Everett Interurban Trail Segment site, 45SN531, and the Scriber Creek Park site, 45SN609) were identified during the archaeological investigation, but neither site retains integrity or is considered historically or prehistorically significant. In consultation with the SHPO and affected tribes, FTA and Sound Transit have determined these sites are not eligible for listing in the NRHP and SHPO concurred (Attachment D). These sites are described in Part 1 of this report.

Historic Built Environment Resources

All building resources within the APE that were constructed in or prior to 1970 were identified and recorded on the Washington State Historic Property Inventory (HPI) database. The survey included the identification and recordation of over 650 resources. In consultation with the SHPO, FTA and Sound Transit identified five historic resources determined to be eligible for listing in the NRHP. The SHPO concurred with these determinations (see Attachment E). None of these properties would be adversely affected by any of the project alternatives. In October 2013, subsequent to publication of the Draft EIS, one of the NRHP eligible resources, Melody Hill Elementary School, was demolished by its owner, Edmonds School District No. 15. Therefore, it is no longer included in this analysis, and only four NRHP-eligible properties remain within the APE.

Introduction

The Central Puget Sound Regional Transit Authority (Sound Transit) is proposing the Lynnwood Link Extension to expand the regional light rail system north from Seattle to Lynnwood, Washington. The transportation corridor of the proposed project, which was previously known as the North Corridor Transit Project, would travel through Seattle and Shoreline in King County, and Mountlake Terrace and Lynnwood in Snohomish County.

The proposed Lynnwood Link Extension would begin at Northgate in north Seattle and end at the Lynnwood Transit Center (Figure 1-1). The approximately 8.5-mile-long project corridor generally follows Interstate 5 (I-5), which is the major north-south route through the state and serves a large commuter market traveling between Snohomish and King counties. The project transportation corridor served by I-5 is bounded by Puget Sound to the west, and the southern half of the corridor is bounded by Lake Washington to the east.

Description of Alternatives

The environmental impact statement (EIS) is evaluating a set of ground level (at-grade) and elevated profile light rail alignment and station alternatives generally following I-5 from the Northgate Transit Center in Seattle to the Lynnwood Transit Center. The Preferred Alternative and the other light rail alternatives are arranged in three geographic segments:

- **Segment A: Northgate to Shoreline.** There are seven alternatives being considered for Segment A from Northgate in Seattle to NE 185th Street in Shoreline. All are on the east side of I-5, with parking on the west side for one of the alternatives. They feature at-grade and elevated profile alignments with two to three stations, including some with park-and-ride facilities. The potential station sites are at NE 130th Street, NE 145th Street, NE 155th Street, and NE 185th Street.
- **Segment B: Shoreline to Mountlake Terrace.** Four alternatives are being considered for Segment B from NE 185th Street in Shoreline to 212th Street SW in Mountlake Terrace. All alternatives begin on the east side of I-5 but end either in the freeway median or on the west side of I-5. The alternatives feature one to two stations with park-and-ride facilities, including a station serving the existing Mountlake Terrace Transit Center (NE 234th Street), and a potential alternative for an additional station at 220th Street SW. One alternative has an option for a 280-stall parking garage on the existing surface lot at the Mountlake Terrace Transit Center.
- **Segment C: Mountlake Terrace to Lynnwood.** Segment C has four route alternatives each departing from the median or west side of I-5 to end at a terminus station with park-and-ride facilities at or near the existing Lynnwood Transit Center.

The Preferred Alternative has a mix of at-grade and elevated sections that run generally along the east side of I-5 from the Northgate Transit Center to the Mountlake Terrace Transit Center. It then crosses to the west side of I-5, where it runs at-grade until 220th Street SW in Mountlake Terrace, and is then elevated along the west side of I-5 until it approaches the Lynnwood Transit Center and park-and-ride,

where it turns northeast to a station adjacent to the Lynnwood Transit Center. The four stations for the Preferred Alternative would be at NE 145th Street, NE 185th Street, at the Mountlake Terrace Transit Center, and at the Lynnwood Transit Center. NE 130th Street is an optional station location; it could be built with the project or partly built and then completed and opened for service later. The optional NE 130th Street station could also have approximately 100 leased parking spaces. About 1,500 new park-and-ride spaces are planned; about 500 spaces would be added at each of the stations except at the Mountlake Terrace Transit Center, which would maintain its current level of parking. For a Preferred Alternative option and Alternative B2A, a station is also considered at 220th Street SW in Mountlake Terrace, with either a 200-space parking garage or a surface lot.

Area of Potential Effects

The APE is the geographic area within which an undertaking may directly or indirectly cause alterations to the character or use of historic properties. For the Sound Transit Lynnwood Link Extension, FTA established the APE in consultation with affected tribes; the DAHP, which is the SHPO for Washington State; and other consulting parties. The APE extends 200 feet to either side of the center of at-grade and elevated profile sections of the alternative alignments and 200 feet from the boundaries of any station or other facility that is constructed as part of the project. The APE also would include an area 200 feet around any construction staging areas. The APE is shown on Figure 1-1.

Regulatory Environment

In April 2012, participating and cooperating agencies for the Lynnwood Link Extension EIS, including the DAHP, had the opportunity to review and comment on draft methodology reports covering a range of environmental topics—including historic and archaeological resources—for the EIS. The draft methodology reports were finalized for use in the Draft EIS in June 2012, after Sound Transit and FTA reviewed the comments received.

Federal Regulations

Sound Transit is conducting an environmental review for the Lynnwood Link Extension under the NEPA, which requires that the effects of federal projects on the environment (including historic resources) be identified and considered. The FTA must also comply with the following federal statutes relating to protection of historic resources.

Section 106 of the NHPA requires federal agencies to take into account the effect of their undertakings on historic properties. The NHPA also provides for consultation with American Indian groups when proposed projects might affect cultural or traditional places or resources (also known as traditional cultural properties) that have value to an Indian tribal group derived from the role the property plays in the community's historically rooted beliefs, customs, and practices.

Regulations in 36 Code of Federal Regulations (CFR) 800 outline the process for complying with Section 106 requirements. The process includes the following steps: (1) initiate consultation with regulatory agencies, concerned Indian tribes, and other interested parties; (2) define the APE;

(3) identify, record, and evaluate resources for potential eligibility in the NRHP; (4) identify project effects; and (5) consult with consulting parties—including affected tribes, SHPO, and other interested parties—to resolve adverse effects, if any, on historic properties. "Historic properties" are historic or archaeological resources that are listed in or eligible for listing in the NRHP. To be eligible for NRHP listing, a historic resource must meet standards of integrity and at least one of the following criteria (36 CFR 60.4):

A. Is associated with an important event or series of events that have made a significant contribution to the broad patterns of American history; or
B. Is associated with an important individual who was significant in our past; or
C. Embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master or possesses high artistic values; or represents a significant and distinguishable entity whose components lack individual distinction.
D. Has yielded, or may be likely to yield, information important in history or prehistory.

To consider the potential concerns of Indian tribes, this environmental review also used:

- American Indian Religious Freedom Act of 1978
- Executive Order 13007 (access to and/or ceremonial use of sacred sites by Indian religious practitioners)

Section 4(f) of the Department of Transportation Act of 1966, as amended (49 United States Code [USC] 303), also provides protections for historic sites. Section 4.18, Section 4(f) and 6(f) Evaluations, of the EIS discusses the project's Section 4(f) uses and effects.

State Regulations

The SEPA and its implementing rules contained in Washington Administrative Code (WAC) 197-11 require the identification of historic, archaeological, and cultural resources listed in national, state, or local registers, and the identification of measures to reduce or control effects on these resources. For listing in the Washington Heritage Register (Revised Code of Washington [RCW] 27.34.200 and WAC 25-12), a property must typically be at least 50 years old, have a high-to-medium level of integrity, and have documented historic significance at the local, state, or federal level. Nine areas of significance are taken into consideration.

RCW 27.44 (Indian Graves and Records) protects Indian burials, while RCW 27.53 (Archaeological Sites and Resources) protects archaeological sites. RCW 76.09 (Confidentiality of Information) provides for the confidentiality of information on archaeological sites.

The Governor's Executive Order 05.05 addresses the need for state agencies to consult with Indian tribes in acquiring or developing land for capital improvements. This analysis follows guidance provided by DAHP's *Washington State Standards for Cultural Resources Reporting*.

Local Regulations

Three of the jurisdictions within the APE—the cities of Seattle, Shoreline, and Lynnwood—have a local preservation program with a board or commission that maintains a register of significant historic properties. The City of Shoreline's ordinance incorporates the King County preservation ordinance. The City of Mountlake Terrace has not adopted a preservation ordinance. The agency coordinated with these cities to review properties meeting their age criteria and to identify any properties that were potentially eligible for their historic registers.

The criteria for listing in local registers are generally similar to, but broader than, the NRHP criteria cited above. The criteria for each jurisdiction in the project area are discussed below.

City of Seattle

The City of Seattle's Landmarks Preservation Ordinance (Seattle Municipal Code [SMC] 25.12) provides that to be eligible for landmark designation a property must be at least 25 years old, possess integrity or the ability to convey its significance, and meet at least one of six criteria. Only the Seattle Landmarks Preservation Board can determine whether a property meets the criteria. A Certificate of Approval from the Board is required to alter or demolish a landmark. The six criteria (SMC 25.12.350) are:

A. It is the location of, or is associated in a significant way with, a historic event with a significant effect upon the community, City, state, or nation; or
B. It is associated in a significant way with the life of a person important in the history of the City, state, or nation; or
C. It is associated in a significant way with a significant aspect of the cultural, political, or economic heritage of the community, City, state, or nation; or
D. It embodies the distinctive visible characteristics of an architectural style, or period, or of a method of construction; or
E. It is an outstanding work of a designer or builder; or
F. Because of its prominence of spatial location, contrasts of siting, age, or scale, it is an easily identifiable visual feature of its neighborhood or the City and contributes to the distinctive quality or identity of such neighborhood or the City.

The City of Seattle Department of Neighborhoods and Department of Planning and Development have an Interdepartmental Agreement on Review of Historic Buildings during a SEPA review. This agreement requires that all buildings over 50 years old that are to be demolished or significantly altered must be reviewed by the City historic preservation program staff for potential landmark eligibility. If the staff determines that the building appears to meet the City's landmark criteria, a landmark nomination application must be prepared and reviewed by the Seattle Landmarks Preservation Board.

Seattle's SEPA policies also contain requirements for archaeological assessments in some circumstances, as explained in the Department of Planning and Development's Director's Rule 2-98.

City of Shoreline

The City of Shoreline has established a historic preservation program through an interlocal agreement with King County (Shoreline Municipal Code 15.20). The requirements and criteria are the same as those for King County's preservation program. Properties are eligible for designation if they are 40 years or older; possess integrity of location, design, setting, materials, workmanship, feeling, and association; and meet at least one of five criteria of significance. A Certificate of Appropriateness from the Landmarks Commission is required to alter or demolish a landmark. Shoreline also recognizes an honorary category of community landmarks. The criteria (King County Code 20.62.040) are generally the same as those for the NRHP:

A. Is associated with events that have made a significant contribution to the broad patterns of national, state, or local history; or
B. Is associated with the lives of persons significant in national, state, or local history; or
C. Embodies the distinctive characteristics of a type, period, style, or method of design or construction, or that represents a significant and distinguishable entity whose components may lack individual distinction; or
D. Have yielded or may be likely to yield information important in history or prehistory; or
E. Is an outstanding work of a designer or builder who has made a substantial contribution to the art.

City of Lynnwood

The City of Lynnwood's historic preservation program (Lynnwood City Code 21.80.400) provides that properties are eligible for designation if they are 50 years of age or older; have integrity of location, design, setting, materials, workmanship, feeling, species, age, and association; and are significant in the history, archaeology, engineering, or cultural heritage of America, Washington state, and/or the City of Lynnwood. The Lynnwood Historical Commission considers the following criteria:

A. Is associated with significant historic events; or
B. Is associated with a person or persons who significantly contributed to the culture and development of the City of Lynnwood; or
C. Embodies architectural characteristics of a type, period, style, or method of construction, architectural design, detail, material, craftsmanship, or that represents a work of a master, or that possesses high artistic values, or that represents a significant and distinguishable entity whose components may lack individual distinction; or
D. Exemplifies the cultural, economic, social, or historic heritage of the City of Lynnwood; or
E. Embodies distinguishing characteristics of an architectural type or specimen; or
F. Embodies elements of architectural design, detail, materials, or craftsmanship that represent a significant architectural innovation; or
G. That have a relationship to other distinctive areas that are eligible for preservation according to a plan based on an historic, cultural, or architectural motif; or

H. That have a unique location or singular physical characteristic representing an established and familiar visual feature of a neighborhood, community, or the City of Lynnwood; or
I. Has yielded, or may be likely to yield, information important to prehistory or history; or
J. That by virtue of the species, age, scarcity, outstanding quality, location, or connection to an historic event or person such landscape trees or other plant material contribute significantly to the community or the city of Lynnwood.

Agency Consultation

State Historic Preservation Officer

FTA and Sound Transit consulted with SHPO on the methodology of the cultural resources surveys (historic and archaeological), on the definition of the APE and determination of effect, and received SHPO's concurrence on both.

Sound Transit and the FTA have produced the *Lynnwood Link Extension Environmental Impact Statement Technical Analysis Methodologies Report* (June 2012) describing the proposed methods to be used to analyze environmental impacts for the Lynnwood Link Extension EIS. Sound Transit continues to consult with SHPO regarding the NRHP eligibility of resources and potential effects on historic properties.

Tribes

FTA and Sound Transit also consulted with potentially affected Native American tribes regarding the proposed project and its cultural resources methodology, and invited the tribes to provide input on resources that might occur in the project study area. The affected federally recognized Native American tribes are the Muckleshoot Indian Tribe, Snoqualmie Tribe, Suquamish Tribe, Tulalip Tribes, and the Yakama Nation. Affected Native American tribes that are not federally recognized are the Duwamish Tribe and the Snohomish Tribe. The EIS *Technical Analysis Methodologies Report* was also provided to the tribes.

Other Consulting Parties

The Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood are additional consulting parties.

Part 1: Archaeological Resources

1 INTRODUCTION

The proposed project is located in Township 26 North, Range 4 East, Sections 5, 8, 17, 20, 29, and 32, and Township 27 North, Range 4 East, Sections 21, 28, 29, and 32, Willamette Meridian (Figures 1-1 through 1-4).

1.1 Area of Potential Effects

The APE for the Lynnwood Link Extension has been defined to include all areas within a 200-foot-wide buffer on either side of the center of the proposed light rail guideway alignments, including at-grade or elevated profile sections. The APE also includes areas within 200 feet of the boundaries of any station, parking structure, staging area, or other facility that is constructed as part of the proposed project. The light rail alternatives have been composited to create the currently defined APE. This APE threshold will account for all potential direct and indirect effects on historic properties.

The APE encompasses the areas where prehistoric and historic-period archaeological resources could be directly disturbed by construction of the proposed project. Although not precisely known at this stage, the APE is anticipated to be within the 200-foot-wide buffer around project elements described above (Figures 1-1 through 1-4). The vertical APE for archaeological resources includes areas of ground disturbance associated with project construction; however, details regarding the depth of construction vary by alternative and will continue to be developed as the project continues through environmental review and design.

2 METHODS

2.1 Archaeological Study

Historical Research Associates, Inc. (HRA) conducted an archaeological field survey in 2012, targeting a representative sample of the project alternatives, which are generally close to one another rather than in distinct corridors. The survey concentrated on high probability areas and lower probability areas as identified through the DAHP predictive model, archival research, and field observations. The survey addressed open and undeveloped areas as well as more developed, urbanized areas (Hicks 2012).

The initial project survey focused on land that is currently within the Washington State Department of Transportation's (WSDOT) right-of-way and other public lands for which rights of entry could be readily obtained.

2.2 Archaeological Sensitivity Model

The DAHP's archaeological predictive model uses standardized and repeatable statistical methods (Bayesian and Kriging) with statewide environmental and cultural resources data to define areas as having varied probability of the presence of prehistoric (or precontact) archaeological resources. Data on geology, soils, landform, elevation, aspect, slope percent, and distance to water, as well as information gleaned from historic-period General Land Office (GLO) plats, were correlated with locations of known archaeological sites to "... determine the probability that, under a particular set of environmental conditions, another location would be expected to contain an archaeological site" (Kauhi and Markert 2009:2-3).

DAHP's model combines local information from field surveys to identify locations with five resulting sensitivity management groups: Very High Risk (5), High Risk (4), Moderate Risk (3), Low Risk (2), and Very Low Risk (1); each group represents the predicted risk of disturbing archaeological materials. These were refined for management purposes, with groups 1 and 2 representing DAHP's conclusion of "Archaeological Survey Contingent upon Project Parameters," group 3 indicating "Archaeological Survey Recommended;" and groups 4 and 5 representing "Archaeological Survey Required."

Because DAHP's probability model only addresses prehistoric archaeological materials, other records were reviewed in tandem with the project survey to help predict where historic-era archaeological materials might be present. The information reviewed included location and land use information gleaned from ethnohistoric information on Native American use of the area and historic-period maps. The resulting information was compared with DAHP's prehistoric archaeology sensitivity zones for the project APE. Areas deemed sensitive for historical archaeology have been included in the project survey record.

2.3 Archaeological Survey

Methods for Survey Tract Selection

HRA overlaid DAHP's sensitivity zones on the proposed project's APE maps to aid in the selection of archaeological survey tracts (Hicks 2012). Areas of known or demonstrated ground disturbance will be excluded if the extent of the disturbance exceeds the depth of anticipated construction impacts. As noted above, the project survey tracts are limited to areas within existing public rights-of-way or ownership.

Project Archaeological Survey Methods

The goal of the project survey was to provide additional information about areas of high archaeological sensitivity. Survey work was divided into two tasks. The first consisted of research into published literature, historical records, and maps to gather information on specific locations and land uses during the ethnographic period reflecting Native American use of the area (e.g., Hilbert et al. 2001) and historic-period maps (e.g., GLO plats, Sanborn Fire Insurance maps). The resulting information was compared with the historical and modern topographic features of the project APE to help verify sensitive landforms, such as stream terraces, and to identify areas where historical disturbance has altered the landform. Where appropriate, the results of this analysis were used, in tandem with DAHP's prehistoric archaeology sensitivity zones, to identify additional survey tracts that would be appropriate for further preconstruction surveys, based on further consultation with DAHP (Hicks 2012). The second task consisted of pedestrian survey and subsurface probes in areas described below.

Fourteen surface survey target areas were chosen prior to field reconnaissance and outlined in the work plan based on archaeological sensitivity overlain by the APE (Hicks 2012). The initial 10 areas overlap with locations selected for subsurface probes, and all occur in very high and high risk areas, according to the DAHP predictive model, while the remainder included some low and moderate risk locations. Although both lists are similar, the surface survey target areas are larger than the probe areas, which focus more intensely on areas with the highest potential for cultural materials according to DAHP's archaeological sensitivity model. During field reconnaissance, survey and subsurface investigation locations were refined based on conditions observed, such as topography, previous ground disturbance, dense vegetation, and rights of entry.

Archival Research Methods and Materials

HRA archaeologists conducted an archival record search for the proposed project. DAHP's online database (WISAARD) was searched for archaeological site records, cultural resource survey reports, historic register properties, and cemetery records. HRA staff used their in-house library to obtain information on the environmental, archaeological, and historical context of the APE. HRA reviewed historical 19th and 20th century maps from the United States Surveyor General (USSG) GLO and other historical maps for the presence of structures, sites, and features that might be extant within the APE. For ease of research and compilation, results were divided by county. A statewide

predictive model layer on DAHP's WISAARD was reviewed for probability estimates for archaeological resources and to aid in developing the field strategy.

Pedestrian Survey Areas

HRA archaeologists Shari Silverman, M.A., M.S.; Jenny Dellert, M.A.; Anthony Cagle, PhD; Angus Tierney, M.A.; and Colin Lothrop, B.A. conducted pedestrian survey and subsurface investigations of the APE between August 2 and 24, 2012 (Figures 2-1 through 2-8, Attachments A and B). HRA archaeologists conducted field reconnaissance in areas of proposed ground disturbance within the I-5 right-of-way and within parcels owned by public agencies along the project alternative alignments. Much of the APE is paved, covered in dense vegetation, or occurs in areas that are inaccessible due to fences and other barriers. Other locations had sparse to no vegetation or were groomed grass areas.

Pedestrian transects were spaced approximately 5 meters (approximately 16.4 feet) apart or closer, depending on available survey areas. HRA examined all soil exposures (non-paved areas such as lawn or ditches). Observations regarding vegetation, ground visibility, and disturbance were recorded in a field notebook and on shovel probe forms. Photographs were taken of the general APE and specific shovel probe areas. Shovel probe locations were recorded using a Trimble GeoXT global positioning system (GPS) unit.

Subsurface Survey Investigations

Thirty-two shovel probes were placed strategically, based on field observations, known locations of utilities and paved areas, and the locations of proposed ground disturbances associated with the project design (Figures 2-9 through 2-14, Attachments A and B). The shovel probe holes were augmented with an auger to increase the depth of the subsurface investigation. Soils typically consisted of modified fill; however, some alluvium was found in shovel probes directly adjacent to Scriber Creek, and glacial till was found in shovel probes east of I-5 between 220th and 221st Streets SW.

Excavated soils were screened through 0.25-inch hardware mesh. Sediments and depositional structure were recorded on standardized field forms, and the probe holes were then backfilled.

2.4 Evaluation of National Register Eligibility

Prehistoric and historic-period archaeological sites, TCPs, and buildings and structures are called historic properties if they are listed in, or eligible for, the NRHP. To be eligible for inclusion in the NRHP, a property must be at least 50 years old or be exceptionally important and meet one or more of the criteria for evaluation, as outlined in 36 CFR 60.4:

> The quality of significance in American history, architecture, archeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, or association; and
>
> A. That are associated with events that have made a significant contribution to the broad patterns of our history; or
>
> B. That are associated with the lives of persons significant in our past; or
>
> C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
>
> D. That have yielded or may be likely to yield, information important in prehistory or history.

Certain properties are unlikely to qualify, including cemeteries, birthplaces, and graves of historical figures; properties owned by religious institutions or used for religious purposes; structures that have been moved from their original locations; reconstructed historic buildings; properties primarily commemorative in nature; and properties that have achieved significance within the past 50 years. Archaeological sites typically are assessed for NRHP eligibility related to Criterion D, but certain rare sites can be found eligible under Criterion A or B if they strongly convey an association with events or persons important to the historical record. Properties can be eligible for the NRHP at the national, regional, or local level. Local registers, such as the City of Seattle's Landmarks Register, generally apply to historic buildings and structures.

In addition to meeting one or more of the criteria, a cultural resource must also retain integrity. The integrity of a cultural resource is a measure of how well it conveys its significance. To retain integrity, a property—or in this case, an archaeological site—must retain the majority of, if not all of, the seven aspects of integrity, which are as follows:

- Location: the place where the property was constructed or the place where the historic event occurred
- Design: the combination of elements that create the form, plan, space, structure, and style of a property
- Setting: the physical environment of a historic property
- Materials: the physical elements that were combined or deposited during a particular period of time, and in a particular pattern or configuration, to form a historic property

- Workmanship: the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory
- Feeling: a property's expression of the aesthetic or historic sense of a particular period of time
- Association: the direct link between an important historic event or person and a historic property

2.5 Approach to Effects Analysis

The analysis for construction effects and operations effects follows the standard approach for historic properties, although this study limits consideration to prehistoric and historic-period archaeological sites and TCPs. The Advisory Council on Historic Preservation's regulations implementing Section 106 of the NHPA create a process by which federally assisted undertakings are reviewed for their effects on properties listed in, or eligible for listing in, the NRHP.

After the resource is identified and evaluated, the next step is to apply the Criteria of Adverse Effects, as outlined in 36 CFR 800.5. These criteria are used to determine whether the undertaking could change the characteristics that qualify the property for NRHP inclusion. If the undertaking could diminish the integrity of such characteristics, then it is considered to have an adverse effect. Adverse effects on archaeological sites and TCPs include, but are not limited to, the following:

- Alteration of the property's setting
- Introduction of visual, audible, or atmospheric elements that are out of character with the setting of the historic property
- Physical encroachment upon an archaeological site

Cumulative effects are discussed using readily available information on past, present, and foreseeable projects.

2.6 Potential Minimization and Mitigation Measures

When an undertaking is found to have an adverse effect, Section 106 requires consultation with the SHPO, affected Indian tribes, and other interested parties regarding appropriate avoidance or mitigation measures. Some typical mitigation measures applicable to archaeological sites include modifying the undertaking through redesign, reorientation, or other similar changes; relocating the historic properties; and implementing data recovery of archaeological information and materials.

The product of consultation, when there is a finding of adverse effect, is an agreement document (Memorandum of Agreement [MOA] in accordance with 36 CFR 800.6[c]) that contains stipulations specifying measures to be implemented that would avoid or mitigate the adverse effects.

3 AFFECTED ENVIRONMENT

3.1 Environmental Context

Over time, human land use patterns have changed with and adapted to the dynamic nature of environmental variables, such as topography, geology, and the availability of floral and faunal resources. Examining these key factors is necessary to understand the use of the environment by past human populations. The following information gives an overview of the resources potentially available to people occupying, traveling through, or seasonally frequenting the project APE.

Geomorphic Setting

Local topography is an important variable that has affected human land use patterns in western Washington throughout the past 14,000 years. The proposed project APE is located in a glacial outwash zone near the northern portion of the Lake Washington embayment (Figure 1-1). The glacial outwash zone includes a series of north-south trending ridges and drainages formed during the advance and retreat of the Puget lobe of the Cordilleran ice sheet, between approximately 18,000 and 15,500 years ago (Porter and Swanson 1998). Radiocarbon dates from Carpenter Lake indicate that Puget Sound near the APE was deglaciated by approximately 16,950 calibrated years before present (Porter and Swanson 1998:208-209). Additionally, the maximum interval of ice coverage at Carpenter Lake is approximately 1,230 years (Porter and Swanson 1998). Human occupation could have occurred in the project area after the retreat of the glaciers.

Small lakes within the glacial recessional outwash (Klisch and Einberger 2009) surround the APE, particularly to the west. They include Scriber Lake, Hall Lake, Lake Ballinger, Twin Ponds, Ronald Bog, Bitter Lake, and Haller Lake. Lake Washington, which fills a deep glacial groove (Chrzastowski 1983), is east of the APE. Streams within different watersheds link many of these lakes.

The project APE is located along the I-5 corridor, within three watersheds: Swamp Creek, Greater Lake Ballinger/McAleer Creek, and Thornton Creek. The northernmost portion is within the Scriber Creek Subbasin of the Swamp Creek watershed. Scriber Creek originates from drainage and groundwater at approximately Lynnwood's northeastern city limits. It flows south into Scriber Lake, then southeast from there through a wetland underneath I-5 into the Brier city limits (Leschine et al. 1997:30). Lake Ballinger is emptied by McAleer Creek into Lake Washington. Hall Creek, which drains into Lake Ballinger at its northern end, flows out of Hall Lake (Klisch and Einberger 2009:5; Simmler et al. 2009:6). Within the southern portion of the APE, historical studies indicate that a system of channels within the Thornton Creek watershed once linked several of the southern lakes in the study area. Thornton Creek may have previously originated from the Meridian Park wetland, but Thornton Creek was known to have originated out of Ronald Bog. Thornton Creek then flowed through Twin Ponds as the stream continued south through a system of wetlands (Tetra Tech/KCM, Inc. 2004:2-3). Thornton Creek slowly meandered southeast through the site of present-day Northgate Mall. It empties into Lake Washington (Nordstrand 2001).

All these watersheds empty into Lake Washington and have been affected by its alternating water surface level and water flow through time. Lake Washington was a marine embayment during the early postglacial period, approximately 15,000 years ago. The early postglacial surface elevations of Lake Washington, and the surrounding river and creek floodplains, were lower than they are today. This variable probably affected the drainage patterns of McAleer Creek and other tributaries; for their first few thousand years, these drainages were probably not deeply incised in glacial till and glacial outwash deposits and therefore likely did not support predictable salmon runs (Dragovich et al. 1994). By 14,000 years ago, areas outside of the riparian habitats in the Sammamish River and surrounding creek floodplains were a mosaic of forest-parkland (Brubaker 1991; Whitlock 1992). By 13,000 years ago, the Cedar River delta had advanced across the south end of the Lake Washington embayment, transforming the embayment from a marine fjord to a freshwater lake (Leopold et al. 1982).

After recession of the ice sheets, isostatic rebound occurred within Puget Sound from 8,000 to 5,000 years ago, which caused tributary stream gradients to fluctuate (Dragovich et al. 1994: Figure 7). The weight of the ice pushed the landscape into earth's mantle during the proglacial episodes, called isostatic depression. Isostatic rebound—upward movement of the earth's crust in order to achieve equilibrium—occurred following the recession of the ice sheets when the pressure or depression on the landscape relaxed, allowing the land to rise (Pidwirney and Jones 2010). Beginning in the late 1800s, humans altered gradients and the general topography of the area surrounding the project APE. Logging activity, which began during the early 1870s, depleted natural protections from stream erosion. Larger-scale changes began in 1916, when the Hiram S. Chittenden Locks (Ballard Locks) opened in Ballard. The locks linked Puget Sound with Lake Washington and resulted in lowering the lake level 9 feet. The change to the lake's water surface level altered the stream gradients that feed into the lake. These changes, combined with drainage alterations such as channelization, diminished the complexity of the streams and wetlands that fed the lake (Kerwin 2001:28). Agricultural use, such as farms, orchards, and dairies, dominated the landscape after logging (Hodges 2006:3), thus transforming the soils, streams, and wetlands. Post-World War II peat mining occurred in Ronald Bog and Twin Ponds and other areas of the region (Hodges 2006:3; Tetra Tech/KCM 2004:2-3). By 1953, this mining created a lake in Ronald Bog. Currently, the Thornton Creek watershed begins as a piped system from Ronald Bog (Tetra Tech/KCM 2004:2-3). The area has since been urbanized (Hodges 2006:3).

Natural Setting

Major climatic changes occurred in western Washington between 12,000 and 7,000 years ago. The climate changed to a warmer and drier regime, with less rainfall than today (Whitlock 1992). The surface elevation of Puget Sound reached a maximum low elevation approximately 8,000 years ago and then rose rapidly, affecting the elevation of Lake Washington and the gradient of the streams and rivers that flowed into the lake (Dragovich et al. 1994: Figure 7). The flow of drainages local to Lake Washington most likely slowed because of the lower gradients, and the lower reaches of some of the streams were able to absorb the decreased flow, thereby creating marshes and wetlands.

Pollen and spores also illustrate the warmer and drier climate before 7,000 years ago, when an open forest of Douglas fir (*Pseudotsuga menziesii*), red alder (*Alnus rubra*), or both grew along the margins of Lake Washington. Pollen directly overlying Mount Mazama ash deposits (6,700 years ago) implies that western redcedar (*Thuja plicata*) replaced the alder and some Douglas fir around 7,000 years ago. The change in dominant species points to a cooling climate. The abundance of western redcedar pollen continued to surface in the soil surrounding Lake Washington (Leopold et al. 1982:1306-1307), indicating its dominance until historical landscape changes in the late 19th and early 20th centuries.

Between 6,000 and 5,000 years ago, the climate became even cooler and wetter, thus causing the mosaic forest-parkland to be replaced by a closed canopy forest similar to that seen in contemporary western Washington, including western hemlock (*Tsuga heterophylla*), western redcedar, and Douglas fir (Barnosky et al. 1987; Brubaker 1991; Whitlock 1992). The wetter climate also caused higher groundwater levels and more surface runoff, which increased the flow of McAleer Creek and other tributary streams and lowered the overall water temperature. By 5,000 years ago, the surface elevation of Puget Sound was within 5 to 10 feet of its contemporary elevation, and sea level rise had begun to slow and stabilize (Dragovich et al. 1994). As a result, it was likely around this time that predictable salmon runs became established in Lake Washington and the Sammamish River system, along with their tributary streams. These runs included (and still consist of) Chinook (*Oncorhynchus tshawytscha*), coho (*O. kisutch*), and sockeye (*O. nerka*) salmon species (Williams et al. 1975:08-203).

The morphology of local drainages has changed within the historic period, notably through increased settlement and development (i.e., straightening and/or hardening of local stream beds). Before extensive Euroamerican influence in the area, the variety of regional vegetational environments provided fodder for an array of faunal resources. Larger terrestrial mammals in the area would have included elk (*Cervus canadensis*), deer (*Odocoileus hemionus*), black bear (*Ursus americanus*), coyote (*Canis latrans*), and mountain lion (i.e., cougar, *Felis concolor*). Smaller mammals would have included snowshoe hare (*Lepus americanus*), raccoon (*Procyon lotor*), red fox (*Vulpes vulpes*), porcupine (*Erethizon dorsatum*), and weasel (*Mustela frenata*) (Kruckeberg 1991; Larrison 1967). Lacustrian and riverine resources included species of waterfowl (*Aix* and *Anas* sp.), beaver (*Castor canadensis*), otter (*Lutra candensis*), muskrat (*Ondatra zibethica*), freshwater fish (such as trout [*Oncorhynchus* sp.], whitefish [*Coregonus* sp.], eels [*Anguillidae* sp.]), and salmon species (Kruckeberg 1991; Larrison 1967; Suttles and Lane 1990).

3.2 Cultural Context

Previous Cultural Resource Management Studies

King County

Background research revealed that there are no previously recorded archaeological sites or previously conducted cultural resource studies within the proposed project APE. Within an approximately 1 mile radius of the project corridor, the review documented one archaeological resources study (Table 3-1), but no professionally documented archaeological resources were found

within 1 mile of the APE. Reports noted the presence of intact glacial materials, alluvium, and heavy disturbance within the area (Dellert et al. 2012; Berger 2008; Berger et al. 2007; Dugas and Robbins 2001:1; Gillis and Larson 2006; Gillis et al. 2006; Hodges 2006:3-5).

Snohomish County

Nineteen previous cultural resource studies have been conducted within 1 mile of the APE in Snohomish County (Table 3-2). Most of these studies were completed for transportation-related projects (Chidley 2008; Hartmann 2008a; Juell et al. 2000; Lorenz 1977; Mighetto et al. 1992; Robbins 1999; Robinson 1981a, 1981b; Stone 2001; McWilliams and Cooper 2012). Three reports were completed for commercial development projects (Dellert and Butler 2010; Gillespie 2009; Silverman and Dellert 2010). Two projects were conducted for trail and bridge improvements for

the Interurban Trail (Dampf and Gilpin 2008; Gilpin and Gillespie 2009). Two series of documents were compiled for the Brightwater Regional Wastewater Treatment System Project (LAAS 2004, 2006). One project was for construction of a cellular tower (Hartman 2008b), and one project documented the history of Alderwood Manor (Mighetto 1992).

Prehistory

Human occupation of the Puget Sound region became possible soon after the retreat of the Vashon stade of the Fraser glaciation, which was the last glaciation episode that occurred 14,000 years ago. The oldest prehistoric sites in the region date to this time period and are primarily lithic scatters. Lack of faunal and organic remains is probably related to the highly acidic soils in the region, which produce a high decomposition rate (Nelson 1990:481). Lithic artifacts would still be preserved in such conditions.

However, new radiocarbon information and DNA analysis from the Manis Mastodon Site (45CA218) indicates that humans were in the Puget Sound region prior to approximately 13,800 years ago. This site, located near Sequim on the Olympic Peninsula, is one of the oldest archaeological sites in North America. This is a unique site because a bone point fragment was identified in the faunal remains (Waters et al. 2011:351).

The development of a cultural timeline extending back to the earliest times is difficult because of the paucity of artifacts and features. Although several cultural chronologies have been proposed, Ames and Maschner (1999) provided perhaps the most comprehensive chronology for the Puget Sound region (Table 3-3). The chronology is listed as five distinct time periods (Paleo-Indian, Archaic, Early Pacific, Middle Pacific, and Late Pacific), divided by changes in technology and increased sedentism.

Table 3-3. Model of Prehistoric Change in the Puget Basin

Dates	Period	Land Use	Settlement	Subsistence	Technology
~13,800 B.C. to 10,500 B.C.	Paleo-Indian	Generalized marine, littoral, and/or terrestrial	Short-term use pit houses and shelters	Generalized marine, littoral, and/or terrestrial	Stone; bone, antler, and perishable materials likely
10,500 B.C. to 4,400 B.C.	Archaic	Generalized littoral, neritic, and terrestrial	Short-term use pit houses and shelters	Generalized littoral, neritic, and terrestrial	Stone; some bone and antler; other perishable materials likely
4,400 B.C. to 1,800 B.C.	Pacific (Early Phase)	Littoral, neritic, and terrestrial	Increased sedentism in seasonal villages	Increased focus on littoral resources and expanded use of neritic resources	Increase in ground stone, bone, antler, and perishable materials
1,800 B.C. to A.D. 200/500	Pacific (Middle Phase)	Neritic, littoral, and terrestrial	Winter villages of plank houses and seasonal camps	Increased focus on marine and riverine resources. Food storage technologies developed	A decrease in stone and diversification of tools and tackle of bone, antler, and perishable materials
A.D. 200/500 to A.D. 1775	Pacific (Late Phase)	Neritic, littoral, and terrestrial	Large permanent villages and special use sites	Specialized marine, riverine, littoral, and terrestrial resource use and management. Extensive food storage	Tools and tackle of bone, antler, and perishable materials; very little stone

Sources: Ames and Maschner 1999:66; Waters et al. 2011
B.C. = Before the Common Era

Paleo-Indian (~13,800 B.C. to 10,500 B.C.)

The earliest phase of human occupation in the Puget Sound region is evidenced by scarce lithic sites, which were most likely temporary campsites or foraging locations. One of the earliest diagnostic tool assemblages in North America is the Clovis tradition (Ames and Maschner 1999:65). Clovis tools are found throughout the continent south of the glacial front but are relatively rare in the Pacific Northwest. A cache of Clovis tools was found at the Richey-Roberts site near Wenatchee; this was a rare find because Clovis tools usually are found as isolates (one or two artifacts occurring by themselves and not associated with an archaeological site) in the Northwest (Ames and Maschner 1999:66). The Clovis toolkit is defined by large, fluted lanceolate points; bone shafts; bone points with beveled bases; blades; blade cores; scrapers; retouched flakes; and hammerstones (Ames and Maschner 1999:65). Other tools representative of the Paleo-Indian phase include basalt cobble choppers and flaked scrapers. The sites are thought to represent small, highly mobile groups, with a general foraging subsistence pattern (Ames and Maschner 1999:24).

Archaic (10,500 B.C. to 4,400 B.C.)

Archaeological sites attributed to this time period are relatively scarce. Postglacial environmental changes were occurring in western Washington, such as fluctuations in sea level and isostatic rebound. These dynamic changes would have affected the way humans occupied and used the landscape as well as how well and where evidence of human use persisted (Ames and Maschner 1999:50, 53). Representative artifacts are largely lithic in nature, such as large projectile points for hunting large game, including the locally diagnostic Olcott point. The Olcott tradition consists of leaf-shaped projectile points and cobble tools (Nelson 1990:483). Some sites dating to the Archaic Period also include bone and antler tools. Olcott assemblages are typically found on older river terraces, primarily within the Snohomish River basin. The nearest recorded site to the APE dating to the Archaic period is 45SN72, near the town of Sultan.

Changes in settlement patterns are first noted in Archaic sites, with an increase in evidence of sedentism. Semi-subterranean pithouses are seen in semi-permanent and permanent villages (Ames and Maschner 1999:66). The seasonal round developed, with more focus on fishing, hunting, and gathering plants as they reached harvestable condition throughout the year in different microenvironments. As Ames and Maschner (1999:25) suggest, this indicates the beginning of a complex hunter-gatherer economy—a transitional time from the foraging economy in the Paleo-Indian phase.

Pacific (4,400 B.C. to A.D. 1775)

Ames and Maschner (1999) divided the Pacific Period into three phases: Early, Middle, and Late. The Pacific Period spans from prehistoric to the beginning of the ethnographic period, when native populations were first introduced to European influences, such as the smallpox epidemic of 1775.

Early Pacific (4,400 B.C. to 1,800 B.C.)

Littoral, estuarine, and riverine environments were affected by the stabilization of sea levels and draining of rivers approximately 5,000 to 3,000 years ago. As a result, resources flourished in these areas, which promoted more intensification of the use of these resources, as well as settlement. The use of specialized resources is first seen during the Early Pacific phase, including camas (*Camassia quamash*) and shellfish. This phase is characterized by an overall increase in food production, with a focus on intertidal resources, as illustrated by numerous thick shell midden sites, which indicates increased sedentism. Bone tools, while present during the Archaic Period, begin to dominate coastal assemblages during the Early Pacific phase, possibly due to better preservation in shell midden sites. However, many new forms of bone and antler tools were also identified in Early Pacific sites (Ames and Maschner 1990:91). Evidence of groundstone use and human burials are also seen as significant events in the Early Pacific Period (Ames and Maschner 1999:90-92).

Middle Pacific (1,800 B.C. to A.D. 200/500)

The stabilization of sea levels encouraged marine environments to flourish. Evidence of shell middens and the remnants of large rectangular cedar plank houses, villages, and large canoes indicate greater sedentism during the Middle Pacific phase. Intensification of marine resources, such as salmon fishing, is also indicated by the diversification and innovations of bone tools, such as toggling harpoons (Ames and Maschner 1999:93). Groundstone tools, such as net weights, further indicate an expansion in fishing (Ames and Maschner 1999:94). The emphasis on a storage-based economy, social inequality, warfare, and the development of coastal art and wooden boxes are seen for the first time as well (Ames and Maschner 1999:93).

Late Pacific (A.D. 200/500 to A.D. 1775)

Archaeological evidence shows cultural continuity between populations at the beginning of the Late Pacific phase and groups in ethnographic times; thus, Late Pacific peoples are the "direct biological and cultural ancestors to the coast's modern Native peoples" (Ames and Maschner 1999:95). Although there is evidence of continuity, there is also evidence of change. An increase in warfare and population changes caused dramatic shifts in demographics (Ames and Maschner 1999:95). Major points in the Late Pacific Period include increasing mortuary rituals; decrease in shell midden burials for the most part, except for large sites such as the Tse-whit-zen Village Site (45CA523) in Port Angeles; decline in the use of chipped stone; changes in subsistence and settlement; and an escalation in warfare. Additionally, heavy-duty woodworking tools are seen for the first time in this period, indicating intensification in this skill (Ames and Maschner 1999:96).

Ethnography

The proposed project APE is in the aboriginal territory of the Duwamish, Sammamish, Snohomish, and Suquamish. These peoples are part of the Southern Coast Salish cultural group, which is composed of two language groupings, Twana and Lushootseed (further subdivided into Northern and Southern). The Duwamish, Sammamish, and Suquamish were part of the Southern Lushootseed

dialect group (Suttles and Lane 1990:486). The Snohomish were part of the Northern Lushootseed language group, although the Snohomish dialect was seen as distinct from other Coast Salish languages (Tweddell 1974:515). These groups followed the general Southern Coast Salish subsistence and settlement pattern.

Territories and Settlement Information

Duwamish

The Duwamish had villages along Lake Washington and the Duwamish, Cedar, and Black rivers (Suttles and Lane 1990:488). Duwamish territory extended along the length of the river of the same name to the confluence of the White and Green rivers (Swanton 1952:26). Duwamish territory also extended from the Muckleshoot lands in the south (around Auburn) to the Suquamish lands in the north (around Seattle), and were often referred to as the Renton Indians (Curtis 1913:174; Gibbs 1877:179; Haeberlin and Gunther 1930:8, 10; Spier 1936:34). The Duwamish had strong ties with other local groups such as the Sammamish and Snohomish, which often included marriage (Ruby and Brown 1992:72).

Duwamish winter village dwellings were constructed of cedar planks and typically had a single-pitch, shed-roof style and were used to house multiple families (Suttles and Lane 1990:491, 493-494). Seasonal campsite dwellings were smaller, single-family style with pole frames covered in mats (Haeberlin and Gunther 1930; Suttles 1990; Suttles and Lane 1990:491, 493-494).

Sammamish

Sammamish peoples inhabited the Sammamish River Valley, the shores of Lake Sammamish, and the eastern shoreline of Lake Washington (Curtis 1913:174; Spier 1936:34). The Sammamish had strong affiliations with the Duwamish to the west, as well as the Snoqualmie to the east.

The Sammamish winter villages had multiple family dwellings consisting of cedar planks attached to heavy wooden frames. Temporary, seasonal dwellings were made of a light pole framework covered with cattail mats that were easily transportable (Lane 1975a:24).

Snohomish

The Snohomish lived in the Snohomish River Valley and had four main villages: just south of Tulalip, at Priest Point, at Sandy Point, and at the southern tip of Whidbey Island. Other settlement locations were along the banks of major rivers, such as the Snohomish River, and along tributaries and at confluences (Gibbs 1877:179; Haeberlin and Gunther 1930:7; Swanton 1952:46). The hunting and fishing territory of the Snohomish extended east of the villages (Haeberlin and Gunther 1930:7). As was the norm with Southern Coast Salish groups, the Snohomish centered life on semi-permanent to permanent winter villages and temporary spring, summer, and fall campsites based on seasonally available resources. Dwellings consisted of cedar plank houses with cedar log poles and plank walls. Three types of roofs were used in the Puget Sound region: shed, gable, and gambrel. The Snohomish commonly had shed-roof dwellings in permanent villages (Waterman and Greiner

1921 in Suttles and Lane 1990:491). Occasionally, the shed-roof houses were also used for potlatches (Suttles and Lane 1990:491). The largest Snohomish potlatch house was located at Tulalip (Haeberlin and Gunther 1930:17). The Snohomish also incorporated stockades into some of their villages—a feature that was not typical for the region. The stockade around one Snohomish village included ditches and sharpened stakes (Gibbs 1877:223). Haeberlin and Gunther (1930:15) note that the village of Hebolb had a palisade, while the village at Priest Point stood unprotected.

The yearly migration from the winter village did not occur in one event for the Snohomish—younger, more energetic groups were the first to leave, followed later by more elderly groups (Haeberlin and Gunther 1930:10). Seasonal campsites were situated by resource locations, such as areas for hunting game and gathering berries. Summer dwellings housed from 2 to 10 families and were portable gable-roofed shelters with pole frames covered in mats or brush (Suttles and Lane 1990:491). The Snohomish summer house was similar to the square house used by the Nisqually, not the "tipi-like" house used by other Puget Sound groups (Haeberlin and Gunther 1930:19).

Suquamish

Suquamish territory included the west side of Puget Sound, from Apple Tree Cove in Kingston to Gig Harbor, including Bainbridge Island (Swanton 1952:48). On the east side of the Sound, the Suquamish inhabited the areas around Seattle and are associated with the Duwamish (Curtis 1913:174; Gibbs 1877:179; Spier 1936:34; Swanton 1952:48). The Suquamish also had marital, economic, and ceremonial ties with the Clallam and Twana (Suttles and Lane 1990:488).

Suquamish cedar plank dwellings were built in the winter villages and were large enough to house multiple families. Most cedar plank dwellings were used as houses, although occasionally they were constructed for potlatch events. The largest known potlatch house was Old Man House at the Suquamish village at Agate Pass (Suttles and Lane 1990:491). Built in the early 19th century, Old Man House was approximately 500 feet long and up to 60 feet wide. The house posts of Old Man House were "carved with grotesque figures of men, naked and about half size" (Gibbs 1877:215 in Suttles and Lane 1990:491). Seasonal campsite dwellings were typically gable-roofed structures with pole frames covered in housemats (Suttles and Lane 1990:491).

Subsistence

Subsistence for Southern Coast Salish groups such as the Duwamish, Sammamish, Snohomish, and Suquamish was based on a system of procuring seasonally available resources. Task groups set out to seasonal camps to hunt, fish, and gather plants, although during ethnographic times, the Snohomish did not hunt deer or elk. The Snohomish bought dressed deer and elk skins and mountain goat wool from the Snoqualmie, paid for with shell money (Haeberlin and Gunther 1930:7, 10). The principal diet of the Snohomish was seafood, not terrestrial game animals (Haeberlin and Gunther 1930:20).

Dietary staples included terrestrial game such as deer (*Odocoileus hemionus*), elk (*Cervus elephas*), and bear (*Ursus americanus*). Waterfowl and other birds were also used. Additionally, all five species of salmon were used, as well as other fish such as kokanee in the Sammamish River drainage (Suttles and Lane 1990:489; Williams et al. 1975:08-203). The Southern Coast Salish people caught salmon

during the spring and fall runs; some was processed for winter storage (Ballard 1957:41-2; Gibbs 1877:194). Weirs, traps, gaff hooks, harpoons, dip nets, leisters, traps, spears, gill nets, and trawl nets were used for fishing (Lane 1975a:24; Suttles and Lane 1990:489). They consumed salmon and other fish fresh, while they smoked and dried surplus for winter storage or trade. Commonly used shellfish species consisted of butter clam (*Saxidomus giganteus*), littleneck clam (*Protothaca staminea*), horse clam (*Schizotherus nuttalli, S. capax*), geoduck (*Panopea generosa*), thin-shelled clam (*Protothaca tenerrima*), razor clam (*Siliqua patula*), and bay mussel (*Mytilus edulis*) (Belcher 1985; Suttles 1990:28; Suttles and Lane 1990:489). The Sammamish also caught eels in the Sammamish River (Lane 1975a:24). Marine resources such as oysters, bottom fish, and marine mammals were procured in Puget Sound as well (Harrington ca. 1909:Frame 314).

Plants gathered for food and medicinal purposes included cattails, roots, sprouts, bulbs, and camas (Gibbs 1877:194; Gunther 1945; Lane 1975a:24; Suttles and Lane 1990:489). Additionally, a variety of berries, including blackberry, elderberry, salmonberry, thimbleberry, blackcap, salal berry, huckleberry, and blueberry, were noted by Gunther (1945). Plant resources were used not only for food, but also as material for such items as dwellings, mats, clothing, and baskets.

Ethnographic Place Names

Several ethnographic place names are in the vicinity of the APE. Figure 3-1 shows GLO maps from the USSG, with ethnographic place name information documented by T. T. Waterman in 1920 and enhanced by Hilbert et al. (2001:82-83, 343-346) and Thrush (2007:220-221, 250-254), in relation to the APE.

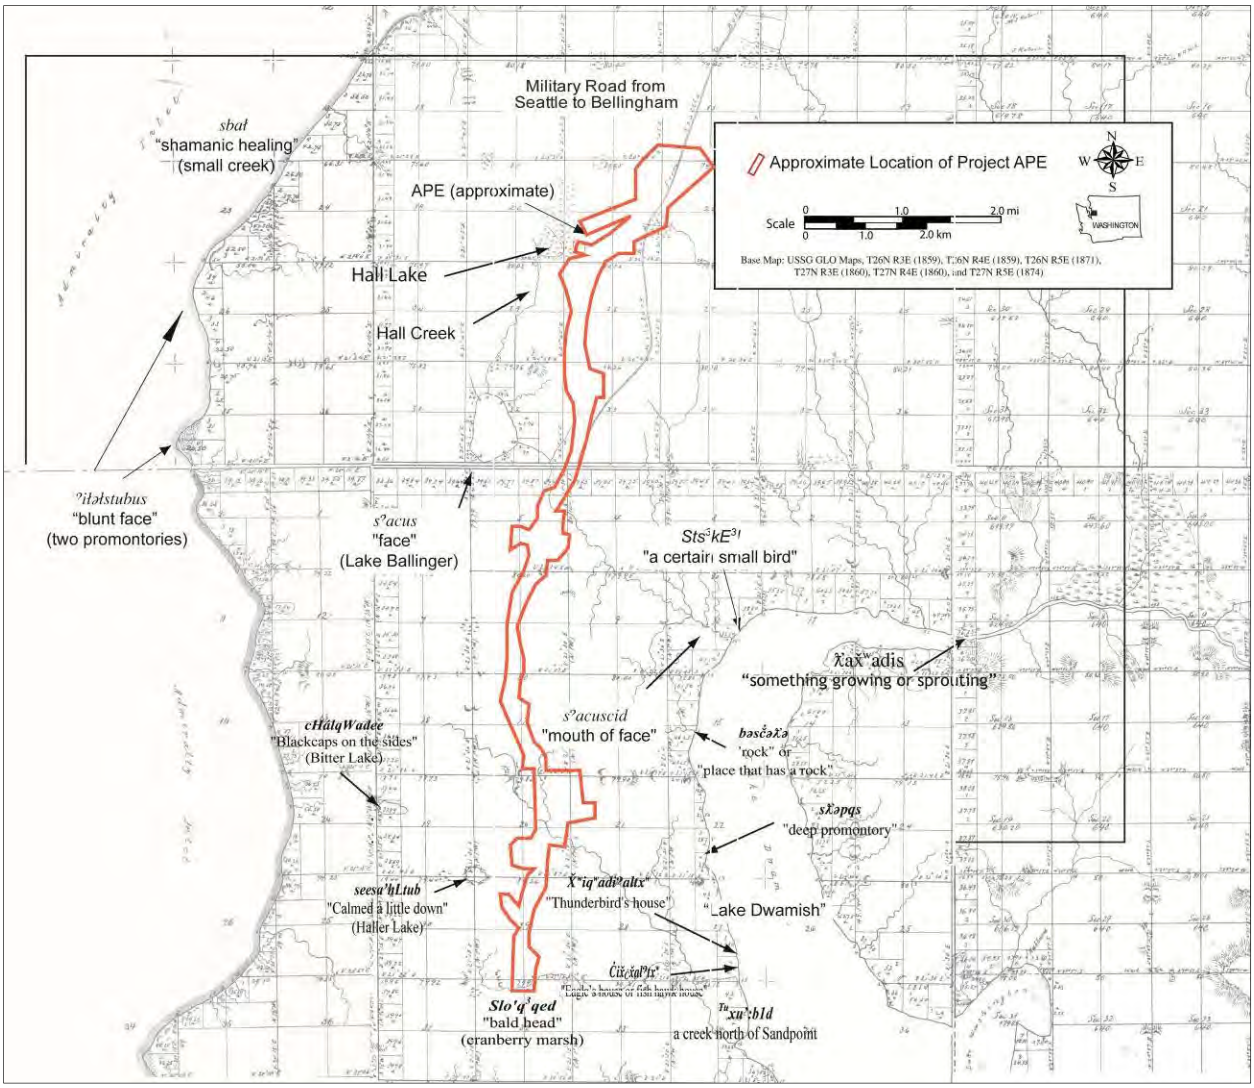

Figure 3-1
Ethnographic place names in the APE vicinity

Lynnwood Link Extension

Beginning at the northern end of the APE, the nearest ethnographic place name is "***s?acus****"* (Lake Ballinger, formerly Lake McAleer), meaning "face," approximately 0.75 mile to the west (Hilbert et al. 2001:82-83; Waterman 1922:179, 190). Approximately 1 mile southwest of Lake Ballinger is Bitter Lake, which was called "***cHaÉlqWadee****,*" meaning "blackcaps on the sides," and referred to the native blackcap (*Rubus leucodermis*) berries and shoots harvested around the lake (Thrush 2007:220-221). A half mile southeast of Bitter Lake is Haller Lake, called "***seesaÉhLtub****,*" meaning "calmed down a little," and is a possible former hunting location (Thrush 2007:220-221). Both Bitter and Haller lakes have also been noted to be refuge areas during slave raids (Thrush 2007:220). At the far southern end of the APE is "***bLooQWqeed****,*" meaning "bald (or peeled) head," which refers to the bowl-shaped topography where North Seattle Community College and Northgate Mall are currently situated. Formerly, this area held an upland marsh/wetland that provided a source for Thornton Creek and would have been ideal for gathering highbush cranberries, marsh tea (*Ledum groenlandicum*), and other plants (Hilbert et al. 2001:82; Thrush 2007:254; Waterman 1922:179, 190).

In the general vicinity, the shorelines of water bodies were attractive locations for native groups during prehistoric and ethnographic times. "Lake Dwamish" to the south and east of the project study area includes eight ethnographic place names near the APE. The first place name is "***Sts^{3}kE^{3}l****,*" meaning "a certain small bird," which refers to a small creek, and is approximately 2 miles east of the APE (Hilbert et al. 2001:82-83). Just southwest of "***Sts^{3}kE^{3}l***" is "***s?acuscid***," or "mouth of face," referring to the creek that feeds Lake Ballinger (Hilbert et al. 2001:82-83). Approximately 1.5 miles farther south is *"**bəsc̓əx̌ə?***," meaning "rock or a place that has a rock," which refers to a boulder on the shore of Lake Washington near Lake Forest Park (Hilbert et al. 2001:82, 83, 86; Waterman 1922:179, 190). Almost 2 miles farther south again is ***ésx̌əpqs****,"* meaning "deep promontory," which refers to a place on the edge of Lake Washington (this is also approximately 2.5 miles east of Haller Lake) (Hilbert et al. 2001:82, 83, 86; Waterman 1922:179, 190). Approximately 0.75 mile south of ***ésx̌əpqs****"* is a cluster of three ethnographic place names. "***X̌^{w}iq^{w}adiʔaltx^{w}****,*" meaning "Thunderbird's house," refers to a place on the shore of Lake Washington at the edge of a bluff. The mythical birds, who were believed to cause thunderstorms by flapping their wings and winking their eyes, were thought to nest in this location (Hilbert et al. 2001:82, 86; Waterman 1922:179, 190). "***Ċiǩc̓ǩalʔtx^{w}****,*" meaning "Eagle's house or fish hawk house," is a little promontory on Lake Washington where an eagle's nest was located (Hilbert et al. 2001:82, 86; Waterman 1922:179, 190). *"^{ɑ}^{ɪ}^{u}xu':b1d"* (Waterman orthography) does not have a specific meaning, but refers to a creek north of Sand Point (Hilbert et al. 2001:82, 85; Waterman 1922:179, 190).

To the west of the project study area, on the shoreline of Admiralty Inlet, there are two other ethnographic place names. "***Sbał***," meaning "the supernatural power which makes one able to be a sucking doctor" or "shamanic healing," is approximately 3.5 miles northwest of the APE and refers to a small creek north of Edmonds (Hilbert et al. 2001:343, 346). "Blunt face," known as "***stubus***"

and ***éʔiłəł stubus,"*** refers to a set of two promontories (Point Edwards and Point Wells) on the shoreline of Admiralty Inlet (Hilbert et al. 2001:343, 346). The two promontories are approximately a mile apart from each other and approximately 4 to 5 miles west of the APE.

History

Puget Sound was first explored by Europeans in 1792, with the expedition led by British Royal Navy Captain George Vancouver, who named the large water body in honor of Lieutenant Peter Puget. Vancouver's expedition landed in Possession Sound, the large sea water inlet around Mukilteo, Everett, and Tulalip Bay. This area was so named because Vancouver officially docked there and claimed it for England in honor of the King's birthday. However, this was not the first contact Northwest Native Americans had with Europeans. By the time of Vancouver's exploration, at least one smallpox epidemic had swept through the groups in western Washington because of direct native/Euroamerican contact (Newcombe 1923; Suttles and Lane 1990).

Contact

King and Snohomish Counties

Euroamerican settlement did not begin in earnest in the Puget Sound region until the mid-19th century, when Great Britain ceded the area to the United States. In 1848, Congress created the Oregon Territory, which included what are now Washington and Idaho. King County was formed by the Oregon Territorial Legislature on December 22, 1852 (Riddle 2006). The passage of the Donation Land Act of 1850 and the establishment of the Washington Territory by Congress in 1853 also prompted increased settlement by Euroamericans (Long 2006). At that time, the area now known as Snohomish County only had three white male citizens (Broom 1990:1). Within half a century, the population was sufficient for Washington to become a state (Schwantes 1996:95-106).

The large influx of Euroamerican settlers caused issues with native groups and led to numerous conflicts. As a result, Washington's first territorial governor, Isaac Stevens, was tasked with making agreements with native groups for land cessions. The goal was relocation of natives to reservations and continued settlement of the land by Euroamericans. More than 64 million acres of land were ceded in exchange for retention of fishing rights, title to circumscribed lands, and annuities. Many treaties were signed as a result. The Treaty of Point Elliott was signed in 1855, and the Sammamish, Suquamish, and Snohomish tribes were among the signatories. The Treaty of Point Elliott stipulated that native groups that traded lands to the United States would in return receive payment, services, and rights to traditional fishing and hunting grounds (Lane 1975b:3; Riddle 2006). As part of the treaty terms, native groups were to relocate to the Tulalip Indian Reservation or the Port Madison Indian Reservation (Ruby and Brown 1992:72-72). While many groups relocated, some resisted and stayed in their traditional lands. Tensions and conflicts surrounding the treaty terms led to resentment and warfare throughout the Puget Sound, known as the Indian Wars of 1855–1856 (Schwantes 1996:104-106). In response to the hostilities, by 1859 the army constructed a "Military

Road" on a former wagon route from Fort Steilacoom in Tacoma to Bellingham near the Canadian border. The Military Road ran roughly north-south along the present-day I-5 corridor (USSG 1860).

The region experienced population growth in the mid-to-late 19th century, with the influx of Euroamerican settlers caused by timber, agricultural, coal, fishing, and homesteading pursuits (Long 2006; Riddle 2006). With the arrival of the railroad, the population in Snohomish and King counties increased. Snohomish County, originally part of Island County, was officially established on January 14, 1861 (Riddle 2006).

Euroamerican settlement came to the Seattle vicinity with the arrival of the Denny Party on Alki Point in 1851. The following spring, three members of the group, Arthur Denny, Carson Boren, and William Bell, filed Donation Land Claims in a more sheltered area, including the most level section on the south part of Elliott Bay, and termed the settlement Duwamps (or Dewamps)(Crowley 2003a; Kirk and Alexander 1995:282). In the fall of 1852, Henry Yesler built the first steam-powered sawmill in the region, significantly raising the timber industry as an economic driver in the Puget Sound area. By December 1852, the Oregon Territorial Legislature approved the establishment of King County and Seattle was named the governmental seat (Crowley 1999, 2006). When the Washington Territory separated from the Oregon Territory in 1853, Seattle lost its claim as the governmental capital, to be replaced by Olympia. The first plats for the town of Seattle were filed on May 23, 1853 by Denny, Boren, and Dr. David Maynard in what is now Pioneer Square (Crowley 2000). Disagreements over the platting process resulted when Maynard platted his streets by compass cardinal points while Denny and Boren laid out streets parallel to the Elliott Bay shoreline. Subsequently, the streets around Yesler Way (formerly Skid Row or Mill Street) do not match up (Crowley 2000).

The following decade led to population and economic growth for Seattle. Citizens lobbied for a territorial university, which was granted in 1861 (the forerunner to the University of Washington) (Crowley 1999; Kirk and Alexander 1995:283). In 1864 and 1866, Asa Mercer traveled to the East Coast, with a letter of introduction from the territorial governor, to bring young ladies to serve as school teachers and as brides for the large population of bachelors, to increase the number of marriageable women in the territory (Kirk and Alexander 1995:284; Muhich 1999). Mercer brought a total of 57 ladies (termed the Mercer Girls) to Puget Sound, many of whom were part of founding families in Puget Sound (Muhich 1999).

On January 14, 1865, the Territory of Washington incorporated Seattle and provided a charter that the city appoint a town clerk, marshal, and magistrate (Lange and Tate 2004). Several ordinances were passed, but some of the leading citizens filed a petition for dissolution. Within 3 years, Seattle reverted to a precinct of King County again. Two years later, citizens petitioned the Legislature for another municipal government and on December 2, 1869, Seattle was reincorporated, with a new town charter (Lange and Tate 2004).

For additional information about the historic period context in these areas, including information on the Seattle-Everett Interurban Railway, please see Part II, Section 8.1 of this report.

3.3 Archaeological Context

Archaeological Properties

Isolated archaeological items, collections of artifacts (e.g., scatters), and buried archaeological deposits all might occur within the project study area. Environmental variables (e.g., flat terrain, proximity to fresh water, and availability of favored floral and faunal resources), ethnographic records, and the documentation of several sites on similar landforms in the vicinity suggest a moderate probability for intact archaeological remains in the APE. Hunter-fisher-gatherer and ethnographic period archaeological resources that may be identified within the project study area include low-density lithic scatters and isolated lithics, such as flakes of stone from tool-making; cores and core fragments; and projectile points. Archaeological resources from ethnographic period sites would be similar to those associated with prehistoric sites, with the addition of Euroamerican goods, such as beads, and a more diverse assemblage of artifacts. Early historic-period archaeological resources would most likely be isolated artifacts related to logging, such as sawdust, nails, stumps with springboard scars, or logging tools; homesteading, such as nails, canning jars, dishes, and other early domestic use items; and farming, such as agricultural equipment, seeds, and feed containers. Later historic-period, non-Indian archaeological resources are likely to be structure foundations and window pane fragments, and domestic and camp-related refuse, such as bottles, cups, other dishes, cans, and toys.

Previously Recorded Archaeological Sites

King County

No professionally documented archaeological sites have been found within 1 mile of the King County portion of the APE. Approximately 0.25 mile east of the APE, along Haller Lake's shoreline, at least four projectile points might have been found by property owners during the 1950s. However, these artifacts' evidence and provenience are not confirmed (Dugas and Robbins 2001:6). The closest confirmed site to the southern portion of the APE within King County is a submerged World War II-era aircraft (45KI424) in Lake Washington, over 2 miles east of the APE (Mester and Historic Aircraft Preservations, Inc. 1990). The closest documented sites in the northern portion of the APE within King County are two sites northwest of Lake Washington within an old delta, over 4 miles east of the APE: a precontact isolate (45KI1098) consisting of a cryptocrystalline piece of lithic debitage (Gilpin 2012a) and a historic-period dump dating from the 1900s to 1970s (45KI1096) (Gilpin 2012b).

Snohomish County

Three previously recorded archaeological sites and one isolate are within 1 mile of the APE in Snohomish County (Table 3-4). None of the previously recorded archaeological resources are within the APE; site 45SN552, site 45SN553, and isolate 45SN564 are approximately 200 to 500 feet to the west, and site 45SN559 is approximately 0.25 mile east of the APE. All of the sites date to the historic

period and are associated with development at Hall Lake (Silverman 2010a, 2010b, 2010c). The isolate consists of window pane glass fragments and could be related to a building constructed between 1945 and 1950 that was approximately 5 to 10 meters west of the identified area (Gilpin 2010).

Table 3-4. Previously Recorded Archaeological Sites and Isolate within 1 Mile of the APE in Snohomish County

Site Name and Number	Site/Isolate Type	Distance From APE	NRHP Status[a]	Reference
45SN552	Historic Structure-Unknown	~200 feet	Potentially Eligible	Silverman 2010a
45SN553	Historic Structure-Unknown	~225 feet	Potentially Eligible	Silverman 2010b
Gorman Property Notched Tree Stumps Site (45SN559)	Historic Logging Property/Historic Culturally Modified Trees	~0.25 mile	Potentially Eligible	Gilpin 2010
Isolate 45SN564	Historic Object	~500 feet	Not Evaluated	Silverman 2010c

Results of Archaeological Sensitivity Mapping and Implications for Archaeological Resources

The DAHP predictive model for archaeological resources is based on statewide information, using large-scale factors. Information on geology, soils, site types, and landforms and from GLO maps was used to establish or predict probabilities for precontact archaeological resources throughout the state. The DAHP model uses five categories of prediction: Low Risk, Moderately Low Risk, Moderate Risk, High Risk, and Very High Risk. The DAHP predictive model map indicated a Low to Very High Risk for cultural resources within the APE. Most of the APE falls within Low, High, and Very High risks; almost none of it is of Moderate Risk. However, the disturbance to the APE during the historic period due to roadway construction and residential development could have affected resources; thus, the overall APE has a low-to-moderate probability for intact archaeological remains.

As Appendix B of the Work Plan shows, the probability areas assigned by DAHP vary along the alignment. The discussion below describes the probability per map, with the maps organized by county and going from south to north.

King County

Map 1—high probability

Map 2—high probability until approximately NE 120th Street, then low probability

Map 3—low probability until approximately NE 130th Street, then high probability

Map 4—high probability

Map 5—high probability until approximately Ridgecrest area, then moderate to low probability

Map 6—low probability with a sliver of high probability on west side of highway, then low probability until approximately NE 170th Street, then resumes to high probability

Map 7—high probability until approximately NE 175th Street, then low probability

Map 8—low probability

Map 9—low probability until approximately NE 195th Street

Map 10—high probability to county line

Snohomish County

Map 10—high probability from county line to approximately 230th Street SW, then moderate to low probability

Map 11—low probability with scattered moderate probability

Map 12—low probability with scattered moderate probability

Map 13—low probability to high probability

Map 14—high probability near Hall Lake, then moderate to low probability as alignment splits

Map 15—moderate to low probability as alignment splits, then high probability near Scriber Creek Park and Scriber Lake area

Map 16—high probability near Scriber Creek Park and Scriber Lake area to low probability at northern end of alignment

On a larger scale, when viewing the DAHP model maps, the high probability locations surround water bodies, such as Hall Lake and Lake Ballinger, and are along water course drainages, such as Scriber Creek, then taper off and sometimes are interspersed with moderate and low probability areas. Modifications to the APE vicinity during the historic period could have affected intact archaeological resources; as a result, the areas around such disturbances would have a decreased probability of such resources. Given the heavy disturbance of I-5, other roadways, and residential and commercial construction, the APE probability for intact archaeological resources would be moderate.

Historic-Period Maps

HRA consulted historic maps and atlases to locate historic-period properties or features within the APE (Table 3-5). No historic-period features or structures were documented on the 1859 GLO map (USSG 1859); the Military Road running from Seattle to Bellingham was constructed soon thereafter (USSG 1900). At the turn of the 20th century, Lake Ballinger, then known as Lake McAleer, was owned by Ira Bartholamue and included structures such as a house, barn, boat landing, and chicken yard documented on the island in the lake (USSG 1900). By 1927, the island was owned by R.A. Ballinger (Metsker 1927).

By the mid-20th century, several housing tract areas, developments, and parcels were platted on atlases in the APE (Anderson 1907, 1910; Kroll 1926, 1934, 1943 [revised 1952]; Metsker 1927, 1936, 1960; Sanborn 1930; USGS 1942, 1953) (Table 3-5).

Archaeological Survey Results

Two archaeological sites (45SN531 and 45SN609) and one foundation that will be over 50 years old by 2020 were identified during the archaeological investigation. Additionally, areas with modern debris were also noted.

Interurban Trail (45SN531)

East of 52nd Avenue, the Interurban Trail consists of a paved bicycle and pedestrian trail (see Figures 3-2 and 3-3 and Attachment C). This area is a section of Interurban Trail, which has been previously recorded as archaeological site 45SN531. As such, an updated site form was prepared to document this portion although no remnants of railroad, including rails, ties, or associated facilities or equipment, are visible in the trail segment within the project APE. The railroad grade has been capped with asphalt, which is patched in places with concrete. Mowed grass lines both sides of the trail within its right-of-way. Power lines, which were constructed after the Interurban Railway's abandonment in 1939, parallel the right-of-way on both sides of the trail.

As noted in Section 8 of this report, the Interurban Railway operated between 1910 and 1939. It connected Seattle with the growing residential areas to the north, eventually transporting people between Seattle and Everett. The power lines were installed by Puget Power (now Puget Sound Energy) after the railroad's abandonment.

Figure 3-2
Overview of the Interurban Trail (45SN531) in Area 10, view east

Figure 3-3
Overview of the Interurban Trail (45SN531) in Area 10, view south-southeast

Scriber Creek Park Site (45SN609)

The Scriber Creek Park site (45SN609) was identified during the excavation of Shovel Probe 9-2 when carpet remnants and a concrete slab were found. Additional investigation of the area and some vegetation clearing revealed the remnants of concrete foundation walls, steps, a possible copper pipe handrail, an intersecting rock wall, and a rock-lined pathway. The site is covered with dense vegetation, and it is possible that the boundaries could be expanded if the area was cleared. A scatter of domestic items included window glass fragments, a composite roof shingle fragment, a 2-gallon Red Eagle gas can, a men's shoe sole, a clear glass bottle, a fragment of red rubber, and a Royal Crystal glass-top, Edison screw-base fuse (see Figures 3-4 through 3-6 and Attachment C).

Figure 3-6
Historic-period artifacts identified at the Scriber Creek Park Site

Landowner documentation shows that Finnish settler Alexander Brunnell filed a land patent (BLM Serial No. WASAA 072207) for the site vicinity on November 23, 1891 (GLO 2012a). Brunnell was on the land for approximately 6 to 7 years, after which he lived at the county poor farm until his death in 1899 (Polk Directory 1894; *Snohomish County Tribune* 1899). An 1895 topographic map shows two structures and a roadway/pathway that correspond with the Scriber Creek Park site area (USGS 1895). The roadway/pathway appears to be the same alignment as the current Cedar Valley Road and was most likely a precursor to the road. Other notable settlers in the area include Peter Schreiber (for whom Scriber Lake, Scriber Creek, and the associated parks are named); Pope, Talbot, and Walker (of Pope and Talbot Mill fame); and William Loughridge (GLO 2012b, 2012c, 2012d).

The property was owned by Erick A. Wallene in the early 20th century (Anderson 1910). The area became more populated, and several housing tract developments were established. The site area became part of the Wallene Interurban Tracts (Metsker 1927; Kroll 1934, 1943 [revised 1952]; Metsker 1960). A few dwellings were also documented on 20th century topographic maps at the site location, one of which appears to coincide with a structure seen on the 1895 map (USGS 1895, 1942, 1953). By the late 1960s to early 1970s, the property was owned by Walter W. Sprague (Snohomish County Assessor 2012). In 1986, Mr. Sprague deeded a strip of land to the City of Lynnwood, and by 1991 the City had purchased the entire parcel, turning it into a passive park (Scriber Creek Park) (Snohomish County Assessor 2012). In 1995, the City added a paved parking lot near the site (City of Lynnwood 2012; Snohomish County Assessor 2012).

The foundation, wall segments, steps, and pathway could be associated with structures seen on the various topographic maps or a combination thereof. The scattering of historic-period artifacts appears to date to the 1940s and 1950s (Attachment C).

There are also two additional segments of aggregate concrete wall/foundation in the southern part of the park that may or may not be associated with the site location. The age of the concrete remnants is undetermined, and no additional artifacts were associated in conjunction with the location (near Shovel Probe 9-5); therefore, it was not recorded.

Foundation at Edmonds School District Parcel

An outbuilding foundation was found in parcel number 00619500000102, which is owned by Edmonds School District 15 (Figure 3-7). The foundation measures 78 feet (north to south) by 45 feet (east to west) and is composed of concrete aggregate reinforced with rebar. Aerial photographs show that construction began on the structure in 1970 (H. G. Chickering, Jr., Consulting Photogrammetrist, Inc. 1965; Washington State Department of Natural Resources 1970); therefore, it was not old enough to qualify as a historic property at the time of this recording. Because the foundation is not old enough to be a historic property, it was not formally recorded and thus does not have an archaeological site number.

Figure 3-7

Traditional Cultural Properties

For the Lynnwood Link Extension, The FTA and Sound Transit sought government-to-government consultation with potentially affected Native American tribes, and initially provided project information by mail and followed up by telephone.

Consultation with the tribes has identified no information regarding TCPs that would be affected by the project.

Evaluation of Archaeological Sites

Sound Transit recorded two archaeological sites and a concrete foundation within the project APE during the current study.

Interurban Trail (45SN531)

Archaeological Site 45SN531 (Seattle-Everett Interurban Trail Segment) dates to at least 1910 and was in operation from at least then until 1939. Thus, the resource is older than 50 years and was assessed for its eligibility for listing in the NRHP. FTA determined and the SHPO concurred that this portion of 45SN531 is not eligible for inclusion in the NRHP, based on the following assessment of criteria applicability and integrity:

- *Criterion A*: Broadly speaking, a resource such as the Interurban Trail could be considered eligible for the NRHP under Criterion A at a state or local level, due to its association with the longest-running electric railroad in Washington State (Bird 2000:1). The Interurban Railway is associated with the expansion of railroads across western Washington, and the subsequent suburban development that the transportation route entailed. The electric railroad was an early form of public transportation at a time when workers were increasingly moving into the suburbs and other communities surrounding Seattle, Everett, Tacoma, and other centers of business. At the inception of the Interurban, it was difficult to impossible for these outlying settlements to reach the urban centers by car (Crowley 2003b). However, the relatively small portion of the Interurban Trail that is present within the project APE (recorded as 45SN531) does not by itself present this association to a transportation trend of regional importance. Therefore, the site is not recommended eligible under Criterion A.
- *Criterion B*: This segment of the Interurban Trail cannot be ascribed to, or associated with, persons significant in our past, outside of the tangential connection to the founders of the Interurban Railroad. Therefore, the site is not recommended eligible under Criterion B.
- *Criterion C*: There are no original features or materials visible in this section of the Interurban Trail; any original grade sediments that remain below the currently paved surface are not distinctive. As a result, this segment of the Interurban Trail is not recommended eligible under Criterion C.

- *Criterion D*: This segment of the Interurban Trail does not contribute to understanding of the operation of the Interurban Railway or its subsequent uses. Therefore, the site is not recommended eligible under Criterion D.
- *Integrity*: Overall, the condition of this small portion of the Interurban Railway grade is poor. The remaining section of railroad grade within the project APE remains in its former alignment; however, it has been altered to beyond recognition of the railroad's presence. No rails, wooden ties, or additional equipment associated with its use as a specific form of transportation were observed during surface or subsurface survey, so little in the way of workmanship remains (besides the grade itself). The railroad's setting has become increasingly urbanized, and there are no associated buildings (e.g., stations) present within or adjacent to the project APE, thus diminishing its integrity of association and setting.

Scriber Creek Park Site (45SN609)

The Scriber Creek Park Site (45SN609) consists of remnants of a historic-period structure, steps, walls, and pathway. Associated artifacts include a scatter of historic-period glass, concrete, shoe sole, rubber fragment, gas can, and glass fuse. While the structure location appears to coincide with a structure shown on the 1895 U.S. Geological Survey (USGS) map, it is unclear whether this is the same structure or one built later, such as those seen on the 1942 and 1953 USGS maps. The site has been overgrown by dense vegetation and offers limited visibility.

FTA determined and the SHPO concurred that Site 45SN609 is not eligible for listing in the NRHP. This recommendation is based on the following assessment of criteria applicability and integrity observations:

- *Criterion A*: It is unlikely that the site is associated with historical events that made a contribution to the broad patterns of our history, as its apparent use has been as a private residence of relatively short period of occupation compared with residential development patterns in the region and local area. As a result, Site 45SN609 is not recommended eligible under Criterion A.
- *Criterion B*: The records reviewed for the location of the building remnant at Site 45SN609 find the property is not ascribed to, or associated with, persons significant in our past, so the site is not recommended eligible under Criterion B.
- *Criterion C*: The foundation remnants and associated rock wall and steps, or any other archaeological materials observed in the project APE, do not embody the distinctive characteristics of a type, period, or method of construction; nor do they represent the work of a master, possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction. As a result, Site 45SN609 is not recommended eligible under Criterion C.
- *Criterion D*: Site 45SN609 is not recommended eligible for listing in the NRHP under Criterion D. In the observed assemblage, few artifacts were found to be diagnostic, and

those that were diagnostic are more than likely too recent to be considered a contributing element to the historic-period scatter. It is unlikely that further investigation will produce materials that would greatly contribute to our understanding of the residential living patterns in the area. As a result, further study would not contribute significant understanding to the history of the local, regional, or national area.

- *Integrity*: Site 45SN609 retains few aspects of integrity. Only portions of the foundation and walls are present as a result of the building having been demolished, rather than having fallen into ruin by deterioration from abandonment, which would have preserved more of its context. The subsurface disturbance evident in test probes conducted in the area reflects the large-scale destructive force used in the demolition of the building, thereby offering little hope for intact, significant deposits. The foundation, steps, walls, pathway, and scatter of historic artifacts contain no unique features. In addition, the setting has been altered by the dense vegetation that has overtaken the area as well as its conversion to a public park, so the site no longer reflects a setting as a private residence.

Foundation at Edmonds School District Parcel

The concrete foundation recorded on Edmonds School District property in the APE does not meet the definition of a historic property under the NHPA because it was not yet 50 years old at the time of this inventory. Therefore, for it to be eligible for inclusion in the NRHP, it would need to be considered exceptionally important (Criterion G). It is unlikely that additional research into its function and chain of ownership would reveal such an exception for this resource, and no additional consideration will be given to it in project planning.

However, the concrete foundation will be 50 years old or older when the project is scheduled for construction; therefore, the foundation is evaluated here against the NRHP criteria for future use.

The foundation is associated with an outbuilding on the Edmonds School District property, which was built in 1970. The foundation consists of remnant aggregated concrete with evidence of doorways, walls, paint, drains, and pipes. The building has been demolished and is not extant.

FTA determined and the SHPO concurred that the concrete foundation is not eligible for listing in the NRHP. This recommendation is based on the following assessment of criteria applicability and integrity observations:

- *Criterion A*: It is unlikely that the foundation is associated with historical events that made a contribution to the broad patterns of our history. As a result, the foundation is not recommended eligible under Criterion A.

- *Criterion B*: The records reviewed for the location of the building remnant at the Edmonds School District parcel find the property is not ascribed to, or associated with, persons significant in the past, so the foundation is not recommended eligible under Criterion B.

- *Criterion C*: The foundation remnants observed in the project APE do not embody the distinctive characteristics of a type, period, or method of construction, nor do they represent

the work of a master, possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction. As a result, the foundation is not recommended eligible under Criterion C.

- *Criterion D*: The concrete foundation is not recommended eligible for listing in the NRHP under Criterion D. No diagnostic artifacts or features were observed associated with the foundation; furthermore, the foundation is the remnant of a building. It is unlikely that further investigation will produce materials that would greatly contribute to an understanding of the history of the education system in the area. As a result, further study would not contribute significant understanding to the history of the local, regional, or national area.
- *Integrity*: The concrete foundation retains few aspects of integrity. Only portions of the foundation are present as a result of the building having been demolished, rather than having fallen into ruin by deterioration from abandonment, which would have preserved more of its context. In addition, some research shows that the building may have caught fire. The foundation does not contain any unique features. Moreover, the setting has been altered by the overgrown vegetation adjacent to the area, as well as its apparent use as bus storage or a drop-off location by the school district. The foundation no longer reflects a setting as part of a school or related school building.

4 EFFECTS ON HISTORIC PROPERTIES (ARCHAEOLOGICAL RESOURCES)

The project survey recorded several historic-period archaeological resources that were observed on the ground surface; no unique resources were found through subsurface testing. However, many areas could not be tested because of paved or otherwise hardened surfaces, and developments and additional areas that may be affected by construction effects are outside of existing public rights-of-way and were not surveyed. It is possible that one or more archaeological sites may still exist beneath the ground surface in areas where project excavation would take place. This potential is heightened in parts of Segment C that were not affected by the construction of I-5.

The project analysis has not found archaeological resources within the APE that are listed in, or eligible for listing in, the NRHP. Project operation and construction could affect historic properties that have yet to be identified within the APE. Further study of the full APE might reveal unrecorded archaeological resources. In addition, continuing consultation with tribes and other interested or affected parties may result in the identification of TCPs within the APE. If so, assessment of effects on those historic properties would be conducted at that time.

There would be no effects on known archaeological resources with any of the project alternatives.

4.1 Long-Term Impacts

No effects on archaeological sites from operation of the proposed project are anticipated.

No Build Alternative

The No Build Alternative would not affect any known archaeological historic properties.

Light Rail Alternatives

None of the alternatives proposed within Segments A, B, and C would affect known archaeological properties, and SHPO has concurred.

4.2 Construction Impacts

No unique effects on archaeological sites from construction of the proposed project are known or anticipated based on this study. The location of many portions of the project alternatives within areas not considered sensitive for the occurrence of archaeological sites, or in high-sensitivity areas that have received previous disturbance, makes it unlikely, although not impossible, that the project would affect NRHP-eligible archaeological sites. Much of the APE has seen ground disturbance, fill, and development, particularly within the I-5 alignment of Segments A and B. In recent decades, roadway construction and residential or other urban development has disturbed much of the study area, and the overall APE has a low-to-moderate probability for intact archaeological remains.

No Build Alternative

The No Build Alternative would not affect any known archaeological historic properties.

Light Rail Alternatives

None of the alternatives proposed within Segments A, B, and C would affect known archaeological properties during project construction, and SHPO has concurred.

4.3 Cumulative Impacts

No NRHP-eligible archaeological resources have been recorded within the project APE to date. Therefore, no effects of this project in combination with other built or proposed projects would have cumulative effects on archaeological historic properties.

5 MINIMIZATION AND MITIGATION MEASURES

Although much of the project APE has seen ground disturbance, fill, and development, it is possible that one or more archaeological sites might exist beneath the ground surface in areas where project excavation would take place. Based on information gathered during the project's surveys to date, archaeological materials may be present in high probability areas that were not available for survey to date, such as under paved surfaces and/or on private property outside of the current I-5 right-of-way. In recent decades, roadway construction and residential or other urban development has disturbed much of the study area, and the overall APE has a low-to-moderate probability for intact archaeological remains. The following protocols for inadvertent discoveries of archaeological deposits will be implemented.

5.1 Inadvertent Discovery of Archaeological Resources

If potentially significant archaeological materials or sites (or evidence thereof) are discovered during the construction of the Lynnwood Link Extension, activities would be halted near the find. All reasonable measures would be taken to avoid or minimize harm to the property until such time as FTA and Sound Transit, in consultation with DAHP and the tribes, determine that appropriate measures have been taken to ensure that the project is in compliance with Section 106 of the NHPA, as outlined in 36 CFR 800 and RCW 27.53.

5.2 Inadvertent Discovery of Human Remains

Any human remains discovered during project construction would be treated with dignity and respect. If ground-disturbing activities were to encounter human skeletal remains during the course of construction, then all activity that may cause further disturbance to those remains must cease and the area of the find must be secured and protected from further disturbance. In addition, the finding of human skeletal remains must be reported to the King County or Snohomish County Medical Examiners and local law enforcement in the most expeditious manner possible. The remains should not be touched, moved, or further disturbed.

The applicable medical examiner would assume jurisdiction over the human skeletal remains, and make a determination of whether those remains are forensic or non-forensic. If the medical examiner determined the remains are non-forensic, that finding would be reported to the DAHP, which would then take jurisdiction over those remains and report them to the appropriate cemeteries and affected tribes. The State Physical Anthropologist would make a determination of whether the remains are Indian or non-Indian, and report that finding to any appropriate cemeteries and the affected tribes. The FTA and DAHP would conduct consultation with the affected parties as to the future preservation, excavation, and disposition of the remains.

Part 2: Historic Resources

6 INTRODUCTION

This part of the Cultural, Archaeological, and Historic Resources Technical Report describes the historic resources in the Lynnwood Link Extension study area and the effects that project alternatives could potentially have on historic resources. It also describes the methodology that Sound Transit used to identify and evaluate historic resources and possible measures to minimize or mitigate the potential effects. A brief history of local development is included to provide a historic context for understanding the buildings evaluated in the historic resources survey.

6.1 Summary of Findings

The historic resources survey conducted in 2012 identified five properties that are eligible for listing in the National Register of Historic Places (NRHP: the Northgate Plaza Apartments in Seattle, Seattle's Northgate Elementary School, a residence in Seattle, a residence in Shoreline, and the former Melody Hill School in Mountlake Terrace. In October 2013, subsequent to publication of the *Lynnwood Link Extension Draft Environmental Impact Statement* (Draft EIS, July 2013), one of the NRHP-eligible resources, Melody Hill Elementary School, was demolished by its owner, Edmonds School District No. 15. The four remaining properties are listed later in this report in Table 8-1 and their locations are shown on Figure 8-1 in Chapter 8, Affected Environment. None of these properties would be adversely affected by any of the light rail alternatives. The State Historic Preservation Officer (SHPO) concurred with the Federal Transit Administration's (FTA) preliminary determination of No Adverse Effect to historic properties on August 12, 2013 (Attachment D).

6.2 Area of Potential Effects for Historic Resources

The area of potential effects (APE) for historic resources includes all areas where one or more of the project alternatives could affect an NRHP-eligible historic resource. The APE was determined by the FTA in consultation with the Washington State Department of Archaeology and Historic Preservation (DAHP). The APE extends 200 feet to either side of the center of at-grade and elevated guideway light rail sections, and 200 feet from the boundaries of any station or other facility constructed as part of the Lynnwood Link Extension. The APE would also include an area 200 feet around any construction staging areas. The APE is shown on Figure 1-1 in Part 1 of this report.

7 METHODOLOGY

The methodology for this study was initially described in the *Lynnwood Link Extension Technical Methodology Report*, which described the APE; the federal, state, and local regulations regarding historic resources in the APE; and the research and field methods used to identify and evaluate these resources (Sound Transit 2012). Chapter 2 of the methodology report describes the research and field methods used to identify and evaluate historic built environment properties for the Lynnwood Link Extension. The objective of the investigations was to identify previously recorded historic properties located in the APE, assess the significance of resources in the APE, and identify additional historic properties in the APE through an intensive-level field survey. This chapter describes where and how the information was gathered and how it informs the results of the archival research and field survey.

7.1 Historic Resources Survey

The first step in identifying historically significant properties was to review lists of resources that have already been listed in a national, state, or local register. This review was supplemented by information from the Shoreline Historical Society, local history books, and archival records. To identify properties that are potentially eligible for listing, Sound Transit conducted a historic resources field survey. Every property within the APE that was built in or before 1970 was surveyed at an intensive level. While the standard NRHP age threshold is 50 years, Sound Transit used 1970 as the threshold year based on a conservative estimate of 2020 as the start of construction. More than 600 properties were surveyed.

For each surveyed property, a Historic Property Inventory (HPI) form was prepared and entered into DAHP's database. The forms contain a photograph; information on the property's location, characteristics, history, and significance; and a recommendation regarding NRHP eligibility. County tax assessor records and photographs, construction records, and other archival information were used to assess the historical integrity and significance of the properties. All the properties surveyed are listed in Attachment E to this report. The inventory form for each property is available electronically in DAHP's WISAARD database (available at http://www.dahp.wa.gov).

7.2 Identification of Historic Properties (Built Environment)

Section 106 of the National Historic Preservation Act (NHPA) requires the identification of all historic properties listed or eligible for listing in the NRHP that are located in the APE. Historians completed the identification of historic properties by evaluating properties within the APE in accordance with NRHP evaluation criteria and made recommendations for eligibility for listing in the NRHP on each property surveyed. The FTA then made determinations of eligibility and submitted the determinations to DAHP for concurrence. The DAHP concurred on the eligibility findings of all properties within the APE. The correspondence in Attachment D documents this concurrence.

7.3 Determination of Adverse Effects on Historic Properties

Section 106 of the NHPA and the implementing regulations require federal agencies to take into account the effects that a proposed undertaking may have on historic properties in the APE. This analysis includes applying the criteria of adverse effect as outlined in 36 Code of Federal Regulations (CFR) 800.5.

The first step in this effects analysis was to determine if any of the alternatives would have any effect on a property, either while in operation (permanently) or during construction (temporarily). In accordance with 36 CFR 800.5(a)(1), an adverse effect is found when an undertaking alters, directly or indirectly, any of the characteristics of a historic property that qualify the property for listing in the NRHP in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Direct effects are generally defined as the physical destruction or modification of all or part of a resource. Indirect effects vary but are typically characterized as the introduction of audible, visual, and atmospheric elements that alter the qualities that make a property eligible for listing in the NRHP. Indirect effects, in the context of historic properties, are primarily defined as effects that are not caused by a physical impact on the property.

Adverse effects may also include reasonably foreseeable effects caused by the undertaking that may occur later in time or be farther removed in distance, or may be cumulative.

Potential adverse effects on cultural resources include, but are not limited to, the following (36 CFR 800.5):

- Physical destruction of or damage to all or part of the property
- Alteration of a property (including restoration, rehabilitation, or repair that is not consistent with the Secretary of the Interior's standards for the treatment of historic properties)
- Removal of the property from its historic location
- Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance
- Introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features

Sound Transit reviewed the project alternatives to determine if aspects of the Lynnwood Link Extension would affect historic properties through construction or operation.

Direct Effects

To determine the direct effects on historic resources, the following information was used:

- The location of project elements and their proximity to historic properties
- Potential partial or complete acquisition of historic properties
- Construction methods and location
- Potential for vibration (short or long term) that could damage historic properties

The extent to which these effects may alter the integrity of the historic properties was analyzed based on experience with previous similar projects and activities, including analyses completed for other environmental impact statements. If the project could diminish the integrity of the historic properties, then it is considered to have an adverse effect.

Indirect Effects

For indirect effects, Sound Transit identified and analyzed qualitatively any broader changes (such as changes in land use) that the proposed project could cause, based primarily on the effects seen from previous similar light rail projects. This analysis could include activities related to the project but not directly part of the project or known at the time of the analysis. Examples include transit-oriented development projects; mitigation or permit compliance activities needed to respond to other kinds of environmental impacts or permitting requirements, such as for stormwater management; or complementary activities that might be taken by others, such as street or trail improvement projects to enhance connections or access to the light rail project. Analyses of potential effects for other relevant elements of the environment are discussed in the Final EIS sections on Land Use, Visual and Aesthetic Resources, and Noise and Vibration.

Cumulative Effects

Cumulative effects are effects that result from the incremental impact of the proposed action when added to other past, present, and reasonably foreseeable future actions. The cumulative effects analysis focuses on the combined effects of the light rail alternatives with other projects that are anticipated to add to the effects on historic resources in the study area.

8 AFFECTED ENVIRONMENT

Northwest King County and the adjoining portion of Snohomish County have become intensively suburbanized since World War II. By 1910, settlers had established communities on Puget Sound and Lake Washington, with small groups of houses and farm plots covering the area in between. This scattered settlement pattern made the land very suitable for the large-scale subdivisions that were built in the 1940s to 1960s to meet the pent-up demand for single-family residences. The area has continued to grow into the 21st century, primarily with single-family residential areas with large-scale multifamily and commercial uses at each end.

8.1 Historic Context

Northwest King County

Early Settlement

At the beginning of the 20th century, when Seattle was already a bustling city, north King County remained heavily forested and sparsely populated. Although homesteaders filed scattered claims in the 1860s and 1870s, by the latter part of the 19th century the Puget Mill Company had acquired much of the area. The company logged the land over the subsequent decades, selling the cleared property for agricultural uses and residential plats (Bender 1989: 13). Small farm plots, dairies, and chicken farms were common, interspersed with scattered housing.

Early transportation was limited to travel by water or on horseback over rough trails. The first road north from Seattle was the Military-Telegraph Road, which had two branches through northern King County. One went directly north to what is now Mountlake Terrace in Snohomish County. The other went eastward around the north end of Lake Washington, past Bothell. It was scarcely a road, but rather a rough trail with telegraph lines strung from the trees (Bender 1989: 160).

The first rail service, limited in scope, was the Seattle, Lake Shore, and Eastern Railway that began service in 1888. This railway ran from Lake Union around the north end of Lake Washington and south to Issaquah. Its primary purpose was to carry logs and coal to Seattle for shipment. Passenger service was a secondary consideration, and the railway line seems to have had relatively little influence on surrounding development. Bothell was a significant port at the north end of Lake Washington because steamboats carried passengers and farm goods from eastern King County down the Sammamish River to the lake. The opening of the Ballard Locks in 1916 lowered the water level so that the river was no longer navigable, ending its function as a port.

On the east side of the project study area, near Lake Washington, the major settlement was Lake Forest Park, which was platted in 1909 and promoted heavily by its developers. The wagon road was graded by that time and was later paved farther north to Bothell and eventually to Everett. By the early 1920s this road (called Bothell Way or Victory Way and later, Lake City Way) became the major route to Everett and Snohomish County. Because of its importance to regional transportation,

it was designated as Primary State Highway 2 in 1951 and later as Secondary State Highway No. 1-J in 1961. It is now designated as State Route (SR) 522 (Wilma 2008).

The Seattle-Everett Interurban Railway

The area's earliest waterfront settlement was Richmond Beach, which was established in 1889 and served by Puget Sound steamers and, after 1890, by the Northern Pacific Railroad. However, the area's major transportation facility during this period was the Seattle-Everett interurban railway. The line was completed from Ballard to Hall's Lake-Richmond Highlands in 1907. The alignment ran just west of Fremont Avenue North up to North 85th Street, where it turned slightly west to run along Evanston Avenue North. At North 100th Street, it turned east in a sweeping curve to 103rd Street, and continued north along the western border of Evergreen Cemetery. In 1908, the line was acquired by Stone & Webster, owner of the Seattle Electric Company, which ran the streetcars within the city. The company extended service to Everett and laid tracks into downtown Seattle using a route down Greenwood Avenue and Phinney Avenue, through Fremont, and on to downtown along Westlake Avenue North and 5th Avenue. In 1910, through-service between Everett and downtown Seattle began, with a train every hour from 6 am to 8 pm (Wing 1988).

Completion of the interurban rail line encouraged growth, including for small farms that took advantage of the convenient transport of produce and eggs to markets. The line enabled people to buy homes away from the city yet get to downtown easily for work or shopping. Groups of houses and small commercial buildings clustered near the stops. Some early plats, such as Echo Lake Garden Tracts (1905), Murphy's Interurban Acres (1908), and Green Lake Five-Acre Tracts (1904), offered large lots particularly suitable for farm plots.

The Seattle Municipal Railway was used in conjunction with the interurban railway to provide service to metropolitan Seattle and to help defray the maintenance costs to city lines (Bird 2000). Ridership declined with the use of automobiles and buses for more flexible routes (Bird 2000; Long 2006). By 1936, the Seattle Municipal Railway converted from streetcars to electric buses, which increased maintenance costs for the Interurban.

With the increased costs and the general economic effects of the Great Depression, the interurban service was abandoned on February 20, 1939. The right-of-way was retained and converted to a power line corridor by Puget Power, with segments passed to Seattle City Light and Snohomish County Public Utility District No. 1. In the mid-1990s, Snohomish County and the Cities of Everett and Lynnwood opened the Interurban Trail, a pedestrian and bicycle trail, along 11.8 miles of the original railway alignment (Bird 2000). The City of Shoreline completed its section of the Interurban Trail by 2008.

Early Highway Development

The interurban railway era was relatively short. Completion of the Aurora Bridge in 1932 gave buses a considerable speed advantage over the trains. In 1936, the Seattle Municipal Railway began converting its streetcars to trolley buses, which did not run on rails and were more maneuverable in traffic. After train service on the interurban rail line ended in February 1939, Seattle City Light

acquired the right-of-way within King County. This right-of-way is now used partially as a transmission corridor and, in Shoreline, as the Interurban Trail. The right-of-way in Snohomish County has also been improved to form the Interurban Trail.

Aurora Avenue, in the same vicinity as the interurban line, began as a rough wagon road through the forest. In 1912, the route (then known as the Grand Trunk Road) was completed from Seattle to the Snohomish County line. In its early years, some observers considered the road pointless because of the low density of development. The establishment in 1911 of Firlands Sanatorium for tuberculosis patients at Fremont Avenue North and North 193rd Street provided an important destination, and an improved road was needed for staff and visitors. In 1927, the road was extended to Everett, thus making a more direct route to Everett than the old Bothell-Everett Highway (SR 522).

In the 1920s and 1930s, Aurora Avenue was part of a national phenomenon of highway building to accommodate the growing popularity of the automobile. It was one segment of the Pacific Highway, which was intended to stretch from Canada to Mexico. The most important improvement was the construction of the "speedway" section, which ran without intersections or traffic signals from Green Lake past the east side of Queen Anne Hill and on a high bridge over the Lake Washington Ship Canal. This section of highway opened in 1932 and offered a quick, direct automobile route from north Seattle to downtown Seattle. By this time, the state had identified this road as Pacific Highway 1; later, until 1969, it had a federal designation of U.S. Highway 99.

Suburban Growth

There was little development in northwest King County during World War II, even though Puget Sound was a national leader in defense production and troop support. The scarcity of building materials limited construction to projects related to the war effort. Some residential construction took place in northeast Seattle, near Sand Point Naval Air Station. However, most wartime residential construction was closer to defense plants in south Seattle. Gasoline rationing limited long commutes.

However, the post-war years ushered in tremendous residential growth throughout north Seattle. The prolonged period of limited construction during the Great Depression and World War II years (1930–1945) resulted in pent-up demand for family housing. Liberal federal loan programs encouraged development, and the large amount of available land in north King County brought construction on a scale never before seen in the Puget Sound region. Major subdivisions such as Ridgecrest (272 lots) included homes built by the block in the 1945–1950 period. These were typically minimal one-story homes with two or three bedrooms and a single garage (usually attached), located on small lots. Few of the vernacular or Craftsman houses from the pre-war, farming era were left standing.

In 1953, residents of north Seattle approved annexation by the City of Seattle. Voters were attracted by the City's larger tax base, which would increase its ability to accommodate rapid growth and needed infrastructure improvements with lower taxes and utility fees. In January 1954, the entire area from Puget Sound eastward to Lake Washington up to NE 145th Street became part of Seattle

(Phelps 1978: 221–223). The area between NE 145th Street and the county line at North 205th Street, known as Shoreline, remained unincorporated until 1995.

As prosperity increased in the 1950s to 1960s, the typical house in the area became larger, usually split-level or single-level ranch houses with an attached single- or double-car garage. Homes were often sited on larger lots on cul-de-sacs, sometimes set among second-growth trees to provide a more rural atmosphere.

One of the first major events of the early post-war era was the 1947 announcement of a new shopping center to serve this bourgeoning population. The location was between the two existing major highways, SR 99 (Aurora Avenue North) and the Bothell-Everett Highway (SR 522) and close to the planned Seattle Freeway corridor (the future Interstate 5 [I-5]), making it ideal for shoppers in automobiles. The new development was hailed as "America's First Regional Shopping Center: Northgate Shopping City" when it opened in 1950. It initially occupied 50 acres, with a $3 million Bon Marche as its anchor store and 77 specialty shops arranged around an open-air pedestrian mall. Nearby were a movie theater, a hospital with medical and dental offices, and large parking lots. After I-5 was completed, the center was expanded to 125 acres. In keeping with modern mall design, the shopping center was remodeled into a covered mall in December 1974. Over the next decades, the surrounding area attracted large numbers of additional stores and multifamily housing.

In 1970, North Seattle Community College opened just west of Northgate Mall and I-5. The 66-acre site was a swampy area that had originally been part of an 85-acre cranberry bog; fill dirt was obtained from the adjacent freeway construction. The campus opened in 1970 with five buildings; by 1972, it had an enrollment of 5,000 people.

The major change in the post-war years was the construction of the I-5 freeway. The state legislature authorized development of limited-access highways in 1947, envisioning that there would be a toll road between Everett and Tacoma. When the Federal Highway Act of 1956 made federal funds available, this route was the state's highest transportation priority, and toll revenue was no longer needed. The freeway between Everett and Seattle opened in February 1965. The property acquisition process began in April 1957, with construction beginning in 1958 (Washington State Highway Commission 1962). The freeway alignment was located roughly equidistant between Puget Sound and Lake Washington, at some distance from the other north-south routes. Much of the land was vacant, used for small farms, or was wetlands. Some of the homes were moved to other nearby sites to escape demolition.

The opening of I-5 encouraged further development because people could easily commute longer distances to jobs in downtown Seattle. Commercial growth also occurred. The Northgate Mall expanded, with numerous retail businesses in the surrounding area. Because of the freeway and transit access, Northgate also became a job center, with several large office buildings. Multifamily development, which had started just after World War II, increased as residents sought affordable housing with easy transportation access.

Southwest Snohomish County

Early Settlement

The first major settlement in southwest Snohomish County was Edmonds, which was settled by George Brackett in 1876. By 1890, enough people had arrived to allow the settlement to be incorporated as a town, with Brackett as mayor. The town thrived with the coming of the Great Northern Railway in 1890 and as a major stop for the Mosquito Fleet steamers that connected settlements throughout Puget Sound. In 1923, Edmonds secured a more permanent position in maritime transportation as the terminus of the ferry between Snohomish County and the Kitsap Peninsula. Several shingle and sawmills provided employment through the Great Depression (LeWarne 2008). Like north King County, Edmonds saw significant population growth after World War II. Aurora Avenue (SR 99) was located toward the eastern edge of the city and its presence encouraged development away from central Edmonds, leading to the development of subdivisions and commercial centers farther east.

Lynnwood

Lynnwood, which is located east of Edmonds, benefited from the development impetus of both SR 99 and I-5. It was settled in 1889 by several homesteaders who found the heavily wooded land was not particularly good for agriculture. The Puget Mill Company, a subsidiary of Pope & Talbot from San Francisco, acquired 6,000 acres for logging. In 1917, rather than selling the property to developers, the company divided the logged-off land into 5- and 10-acre "ranchettes" suitable for small farms and sold them for $200 an acre. The company named the new community Alderwood Manor. To promote sales, they sponsored a 30-acre demonstration farm to teach city dwellers how to raise crops and chickens, with all the supplies sold by Puget Mill. The interurban rail line was completed through the area in 1910 with seven stops that provided convenient access. By 1922, the Lynnwood area population had risen to nearly 1,500, along with 200,000 hens. The egg market dropped during the Great Depression, and most farmers had to diversify. Following World War II, Alderwood Manor experienced the residential growth seen throughout the Puget Sound region, and it incorporated as the City of Lynnwood in 1959. The completion of I-5 through the heart of the city in the 1960s led to the development of Alderwood Mall in 1979 (Wilma 2007).

Mountlake Terrace

Mountlake Terrace was developed by Albert LaPierre and Jack Peterson, who bought an abandoned airstrip in 1949 to build a new subdivision. The first development consisted of small (640-square-foot) cinder-block houses that sold for $4,999 to returning soldiers. Peterson, a bricklayer, used an efficient construction model, with one crew laying foundations, a second crew erecting concrete-block exterior walls, and a third crew installing the roof and interior walls. LaPierre and Peterson had previously built the Ridgecrest Homes subdivision in Shoreline, but they moved to Snohomish County because land prices were lower (Tate 2008). Mountlake Terrace continued to grow, with the construction of more than 2,300 homes announced in 1951 (Cloud 1983: 222). It incorporated as a

city in 1954. The completion of I-5 in the 1960s encouraged further automobile-oriented commercial and residential development.

Recent Development

In the past two decades, the commercial area around Alderwood Mall has expanded with substantial retail and office buildings as well as large multifamily complexes. The opening of a major Boeing plant in Everett in 1968 provided a major job center north of Seattle, which resulted in an increased demand for housing in Snohomish County. The construction of subdivisions has continued. However, as the population and the cost of land have increased, a larger percentage of residential development has been in multifamily complexes, both condominiums and apartments.

8.2 Historic Properties (Built Environment) in the Area of Potential Effect

Only one historic property was previously identified within the APE: a house at 727 NE 189th Street, which was identified in King County's Historic Resources Survey of Shoreline (Copass 1996) as meeting King County's and Shoreline's criteria for landmark designation. This house has been determined to not have sufficient integrity to be eligible for NRHP listing. The DAHP correspondence in Attachment D documents their concurrence with this finding and with the findings for the properties in Table 8-1. The project would not affect this property.

Historic Resources Survey Results

The historic resources survey evaluated more than 650 properties. Four of these, as listed below in Table 8-1, shown on Figure 8-1, and described in the subsequent text, were determined to be eligible for the NRHP and SHPO concurred (Attachment D).

Table 8-1. NRHP-Eligible Resources within the Area of Potential Effect [1]

Number	Address	Description	Construction Date	Historic Status Eligibility
1074	11207 1st Avenue NE, Seattle	Northgate Plaza Apartments	1951	Eligible for NRHP Criterion C
1033	11725 1st Avenue NE, Seattle	Northgate Elementary School	1956	Eligible for NRHP Criterion C
912	13130 5th Avenue NE, Seattle	Parsonage	1928	Eligible for NRHP Criterion C
819	132 NE 155th Street, Shoreline	Log house	1920	Eligible for NRHP Criterion C

[1] As described in Section 6.1, the former Melody Hill School was demolished in October 2013 by its owner, Edmonds School District No. 15. It is no longer included in this analysis.

Figure 8-1
Map of Historic Properties

Lynnwood Link Extension

The four NRHP-eligible properties represent two of the area's developmental periods. Both residences date from the early 20th century, when north King County was lightly settled with scattered houses, individually and in small groups. The other properties are a large apartment complex and a school dating from the mid-20th century—a period of intensive development. All four properties are eligible for the NRHP under Criterion C as embodying "the distinctive characteristics of a type, period, or method of construction."

In addition to being NRHP-eligible, these properties are also eligible for listing in the Washington Heritage Register and for landmark designation in the Cities of Seattle and Shoreline. Mountlake Terrace does not have a local historic preservation program. The historic resources survey preliminarily identified one other property that appears likely to meet the Seattle landmark designation standards: the Seattle Latvian Evangelical Lutheran Church (11710 3rd Avenue NE, Seattle). The property, built in 1971, does not meet the 50-year age threshold for the NRHP, but does meet Seattle's 25-year age threshold for eligibility. Only the Seattle Landmarks Preservation Board can determine if the property is eligible for designation. No other properties in the survey appear likely to meet local landmark criteria.

Sound Transit consulted with the Cities of Seattle, Shoreline, and Lynnwood regarding resources that may meet the criteria for designation under local historic preservation ordinances. The City of Seattle agreed with the assessment of potential eligibility for the Church Parsonage, Northgate Elementary School, Northgate Apartments, and the Seattle Latvian Evangelical Lutheran Church.

The City of Shoreline reviewed the list of historic resources and concurred that only one property in the APE is in the Shoreline Historic Property Inventory, the house at 727 NE 189th Street, which would not be affected by the project because of its distance from the light rail guideway. The City of Shoreline updated its Historic Resources Inventory in 2013. The NRHP-eligible Log House at 132 NE 155th Street was added to the inventory, but no additional buildings within the APE were added.

The City of Lynnwood noted two buildings that have been altered and lack integrity but have some historical importance to the City. The Cedar Valley Grange played an important role in the history of Lynnwood, serving as a community fixture. None of the project alternatives would remove this structure, and light rail located across 52nd Avenue West would not affect it. The City also noted that Hall's Lake is important to local history as the location of one of the area's first sawmills and an early church camp. None of the project alternatives would remove structures adjacent to Hall's Lake. The guideway would be located near the adjacent freeway and would not affect the lake. The City also noted the Interurban Trail, which has been built on the former Interurban line right-of-way. The importance of the Interurban is discussed in this report, but no visible evidence of the rail line remains.

Northgate Plaza Apartments is a garden apartment complex with 207 units in 34 buildings (see Figure 8-2). The complex was designed in 1950–51 by John Graham, Jr., the architect of nearby Northgate Mall, to help address the critical need for housing after World War II. jill

Figure 8-2
Northgate Plaza Apartments,
11207 1st Avenue NE, Seattle

Northgate Elementary School was built in 1956 to accommodate post-war population growth in North Seattle (see Figure 8-3). It was designed by Paul Thiry, one of Seattle's premier Modernist architects.

Figure 8-3
Northgate Elementary School,
11725 1st Avenue NE, Seattle

The large residence shown in Figure 8-4, currently used as a parsonage by the North Seattle Church of the Nazarene, is a very good example of the Georgian Revival style, exhibiting an Italian Renaissance influence and an extensive use of terra cotta ornament.

Figure 8-4
Parsonage, 13130 5th Avenue NE, Seattle

The house shown in Figure 8-5 is not only one of the oldest buildings in the vicinity but is an example of a log house, which is very unusual in north King County.

Figure 8-5
Log house, 132 NE 155th Street, Shoreline

9 EFFECTS ON HISTORIC PROPERTIES (BUILT ENVIRONMENT)

None of the light rail alternatives would adversely affect any of the historic properties within the APE; SHPO has concurred with this finding.

9.1 Long-Term Impacts

Long-term effects are those effects considered permanent, including impacts that would occur or continue to occur while the proposed project is in operation. The effect would be adverse if it diminishes a historic property's (NRHP-eligible) integrity of location, design, setting, materials, workmanship, feeling, or association, and thus alters any of the characteristics that qualify the property for inclusion in the NRHP.

None of the light rail alternatives would have permanent effects on any of the historic properties within the APE.

No Build Alternative

The No Build Alternative would have no effect on historic properties because it would involve no construction.

Light Rail Alternatives

Segment A: Seattle to Shoreline

Neither the Preferred Alternative nor the other Segment A alternatives would affect historic properties during operation of the Lynnwood Link Extension. All of the historic properties located within Segment A are far enough from the transportation facility so that vicinity impacts, such as noise, vibration, or visual effects, would be extremely minor. The introduction of the new transportation facility would not alter or diminish the buildings' integrity of setting because the guideway would be constructed adjacent to I-5. None of the Segment A alternatives would alter or diminish the historic properties' remaining aspects of integrity: location, design, workmanship, feeling, or association.

The **Northgate Plaza Apartments** are located across the street from the potential Lynnwood Link Extension alignment; all of the Segment A alternatives would involve light rail guideway construction between the 1st Avenue NE and I-5, west of the Northgate Plaza Apartments. This would cause a minor alteration of the apartments' integrity of setting, but because the new guideway would be adjacent to I-5, the effect would not be adverse. There would be no other long-term alteration of the apartments' integrity of location, design, materials, workmanship, feeling, or association.

Northgate Elementary School is located west of I-5 and adjacent to the 117th Street overpass, which would be rebuilt under Alternative A1. However, there would be no effect on the historic property because the overpass is being replaced, not newly located to the site. There would be no other long-term alteration to the building's integrity of location, design, setting, materials, workmanship, feeling, or association. Other Segment A alternatives, including the Preferred Alternative, would be west of I-5 and not affect this resource.

The **Parsonage** is located east of 5th Avenue NE, where all Segment A alternatives would include a guideway west of the Parsonage. Alternatives A5, A7, A10, and A11 would include a station at NE 130th Street; the Preferred Alternative also includes an option for a station at this location Any of these would cause a minor alteration to the Parsonage's integrity of setting and feeling, but because the new guideway and station would be adjacent to I-5, these effects are not considered adverse. No other aspect of integrity (location, design, materials, workmanship, or association) would be altered as a result of the station operation. No other Segment A alternative would affect this resource.

The **Log House** is located across the street from the proposed parking facility that would be constructed under Alternatives A5 and A7. The parking facility would be across NE 155th Street and on the far side of the fire station next to I-5, causing a minor alteration of the building's integrity of setting and feeling. These effects are not considered adverse. No other aspect of integrity (location, design, materials, workmanship, or association) would be altered as a result of light rail operation. All of the Segment A alternatives would include a guideway west of the Log House adjacent to I-5.

The Lynnwood Link Extension could affect property owned by the **Seattle Latvian Evangelical Lutheran Church**, which is not NRHP-eligible, but may meet Seattle Landmarks eligibility criteria. The Preferred Alternative and Alternatives A1, A5, and A10 would displace the residence (caretaker's house) on the property, which has been determined not to be NRHP-eligible. None of the alternatives would result in loss of access or displacement of the church.

If the Seattle Landmarks Preservation Board were to designate the property as a Seattle Landmark, Sound Transit would seek a Certificate of Approval from the Board, if required, to undertake the necessary work on the site and would comply with the Board's requirements.

Segment B: Shoreline to Mountlake Terrace

None of the Segment B alternatives would affect historic properties because there are no historic properties within this segment of the APE. The house at 727 NE 189th Street is not NRHP-eligible but is on the City of Shoreline's Historic Property Inventory; the Lynnwood Link Extension would also not affect this property. It is located about one block east of the guideway, which would run along the east side of I-5.

Segment C: Mountlake Terrace to Lynnwood

None of the Segment C alternatives would affect historic properties because there are no historic properties within this segment of the APE.

During consultation, the City of Lynnwood noted two properties that have been altered and lack integrity, but continue to have some historical importance to the City. The Cedar Valley Grange played an important role in Lynnwood's development, becoming a community fixture. None of the project alternatives would alter or remove this structure and light rail located across 52nd Avenue West would not affect it. The City also noted that Hall's Lake is important to local history as the location of one of the area's first sawmills (no longer extant) and an early church camp. None of the project alternatives would remove structures near the lake. The guideway would be located adjacent to the freeway and would not affect the lake. The City also noted that the Interurban Trail has been built on the former Interurban rail line right-of-way. The Interurban is discussed above in section 3.3, but no visible evidence of the rail line remains.

9.2 Construction Impacts

Construction effects are those effects that would be temporary and occur only during project construction, such as noise, dust, or reduced access. While these may disturb occupants, they would be an adverse effect only if they diminished the qualities that make the property eligible for NRHP listing—integrity of location, design, setting, materials, workmanship, feeling, or association. An example would be vibration during construction that would cause substantial damage to the property.

In order to reduce construction-related effects, such as fugitive dust, noise, vibration, and other impacts, Sound Transit will implement standard BMPs throughout the entire Lynnwood Link Extension construction period. Construction noise and vibration impacts can be reduced with operational methods and scheduling, equipment choice, and acoustical treatments. Noise and vibration control will meet local regulatory requirements, ordinances, and permit or variance conditions.[2]

Potential construction-related effects on historic built environment properties are described below.

Segment A: Seattle to Shoreline

The **Northgate Plaza Apartments** are located across the street from the potential alignment. All of the Segment A alternatives would involve light rail guideway construction between the Northgate Plaza Apartments and I-5, which would have temporary minor effects, including noise, changed visual quality, and reduced access. These effects may temporarily alter the integrity of setting, but they would not permanently diminish any of the seven aspects of integrity; therefore, these effects are not considered adverse.

Northgate Elementary School would experience temporary, minor proximity effects from Alternative A1 during the rebuilding of the NE 117th Street overpass. These effects may include noise and visual intrusions. Integrity of setting may potentially be temporarily altered, but not

[2] For specific noise and vibration control measures during construction, please see Section 4.7, Noise and Vibration, of the Final EIS. For information on air quality, see Section 4.6, Air Quality and Greenhouse Gases.

diminished. These alternatives do not have the potential to alter or diminish the building's integrity of location, design, materials, workmanship, feeling, or association; therefore, the effects are not considered adverse.

The **Parsonage** would experience temporary, minor proximity effects from Alternatives A5, A7, A10, and A11 during construction of the NE 130th Street Station. Construction impacts, such as noise, vibration, reduced access, or visual intrusions, could temporarily alter the integrity of setting and feeling of this historic resource. However, setting and feeling would not be permanently diminished; therefore, these effects are not considered adverse. No other aspect of integrity (location, design, materials, workmanship, or association) would be altered.

The **Log House** would experience temporary, minor proximity effects from Alternatives A5 and A7 during construction of a parking facility across the street. Construction impacts, such as noise, vibration, reduced access, or visual intrusions, could temporarily alter the integrity of setting and feeling of this historic resource. However, setting and feeling would not be permanently diminished, and these effects are not considered adverse. No other aspect of integrity (location, design, materials, workmanship, or association) would be altered. No other Segment A alternative would affect this resource.

The **Seattle Latvian Evangelical Lutheran Church,** which is not NRHP-eligible but may meet Seattle Landmarks eligibility criteria, could have short-term restricted access during construction for all alternatives. Other construction impacts, such as construction traffic, visual changes and intrusions, noise and vibration, would also occur but would be temporary and minor.

Segment B: Shoreline to Mountlake Terrace

None of the Segment B alternatives would affect historic properties during construction because no historic properties are located within or adjacent to the proposed construction area.

Segment C: Mountlake Terrace to Lynnwood

None of the Segment C alternatives, including the Preferred Alternative, would affect historic properties during construction because no historic properties are located within or adjacent to the proposed construction area. None of the Segment C alternatives would affect landmarks or locally significant resources in Lynnwood.

9.3 Indirect Effects

Indirect or secondary effects would be limited because there are so few historic properties in the Lynnwood Link Extension corridor.

9.4 Cumulative Impacts

Cumulative impacts would be limited because few historic properties exist in the project corridor. Moreover, few pending projects have been identified that involve construction or other activities that would affect historic resources in the area.

10 MINIMIZATION AND MITIGATION MEASURES

Section 106 of the NHPA stipulates that the agency official, in consultation with the SHPO and other consulting parties, must "develop and evaluate alternatives or modifications to the undertaking that could avoid, minimize, or mitigate adverse effects on historic properties (36 CFR 800.6(a))." Where adverse effects cannot be avoided or minimized, they would be resolved through mitigation measures and memorialized in a Memorandum of Agreement (MOA), pursuant to 36 CFR 800.14(b).

10.1 Minimization

The proposed Lynnwood Link Extension alternatives would avoid and minimize effects on historic properties. None of the alternatives would involve demolition or direct alteration of an NRHP-eligible property.

10.2 Mitigation

Because there would be no adverse effects on NRHP-eligible historic properties, no MOA is anticipated for the Lynnwood Link Extension.

Shovel/Auger Probe Table

SHOVEL/AUGER PROBE TABLE

Table B-1. Results of Shovel Test Probes in the APE

Shovel Probe Number	Survey Area	Maximum Depth Below Surface	Description	Cultural Materials Identified
1-1	1	132 cm Augered 94 cm+	0–94 cm: Medium-brown very compact silty sand with 30% rounded to subangular gravel and cobbles to 15 cm diameter 94–132 cm: Light-brown very compact sand, no gravel	Broken bottle glass in top 20 cm (modern)
2-1	2	137 cm	0–28 cm: Light-gray to brown loose sand, 30% gravel road fill 28–83 cm: Fabric covering orangish-brown sand, 10% gravel fill 83–137 cm: Loose gray sand, 30% gravel fill	Landscape fabric at 28 cm (modern)
3-1	3	100 cm	0–80 cm: Compact sand & gravel (30%) road fill, chunks of asphalt 80–100 cm: Continued road fill, gray, strong hydrocarbon smell, probably crushed asphalt fill	None
3-2	3	120 cm Auger 100+ cm	0–50 cm: Grayish-brown fine sandy silt, 30% very small to large subrounded–subangular pebbles, 15% small-medium roots, gradual smooth boundary 50–88 cm: Light-brown slightly fine sandy silt, 25% very small–large subangular pebbles, diffuse, smooth boundary 88–120 cm: Brown slightly fine sandy silt, 25% very small–medium pebbles, 5–10% charcoal	None
3-3	3	110 cm	0–110 cm: Variously colored (gray, tan, brown) compact sand and gravel road fill, 20–30% rounded gravel, root obstructing @110 cm	None
3-4	3	58 cm	0–58 cm: Brownish-gray compact sandy silt road fill, 40% pebbles and gravel and 10% cobbles Terminated at old concrete	None
3-5	3	100 cm	0–24 cm: Brown slightly fine sandy silt (Fill) 20–25% small–large subrounded and subangular pebbles, 20% fine roots. Abrupt smooth boundary 24–60 cm: Gray and brown fine/medium sandy silt (disturbed with fill material), 35% small–large subangular pebbles, compact clear smooth boundary 60–79 cm: Reddish-brown clayey fine sandy silt, 15% small–medium subangular and angular pebbles abrupt smooth boundary 79–100 cm: Dark-brown clayey fine sandy silt (damp), 15% medium–large subrounded to angular pebbles	Ceramic and clear glass (modern) Plastic and green glass (modern) 3 shards clear glass, 1 thin copper metal strip (modern)
3-6	3	90 cm	0–25 cm: Grayish-brown fine sandy silt, 20% small–medium subrounded pebbles, 20% fine roots, abrupt smooth boundary 25–90 cm: Yellowish-brown fine/medium sandy silt fill material, 35% small–large subangular pebbles. At 90 cm, gravels increase to 90%, obstructing further excavation	None

Table B-1. Results of Shovel Test Probes in the APE

Shovel Probe Number	Survey Area	Maximum Depth Below Surface	Description	Cultural Materials Identified
3-7	3	100 cm	0–42 cm: Road fill with brownish-gray moderately compact sandy silt with 40% gravel, 10% cobbles. Ashy burned wood in east and south walls at 42 cm 42–100 cm: Black sandy silt with high organic content	None
3-8	3	100 cm	0–75 cm: Grayish-brown fine sandy silt fill material, 30% small–large subrounded to subangular pebbles, 20% rootlets first 30 cm only, abrupt smooth boundary 75–100 cm: Dark-brown slightly clayey silty fine sand, 15% small and medium subrounded pebbles, 15% charcoal, moderate amount of decaying organic material	Pieces of modern trash
3-9	3	110 cm	0–58 cm: Dark-gray semi-compact road fill, 40% rounded gravel 58–76 cm: Soft, loosely consolidated sandy silt, chunks of charcoal, <5% gravel 76–110 cm: Dark-gray with orangish-brown mottled clayey silt, <10% gravel 110+ cm: Dark-gray gravelly sand, possibly more road fill	None
3-10	3	100 cm	0–100 cm: Disturbed road fill with black sandy silt, 40% subrounded pebbles & cobbles, gravels	Worn, twisted metal fragments (20–30cm) in south wall, safety glass, metal fragments throughout but decreasing with depth (modern)
3-11	3	120 cm (Auger after 90 cm)	0–21 cm: Brown slightly sandy silt, 10% small subrounded pebbles, 5% rootlets, abrupt smooth boundary 21–53 cm: Gray to light-gray silty coarse sand fill, 35% small–large subangular pebbles, very compact, abrupt smooth boundary 53–80 cm: Black clayey silt or silty clay, 5% small pebbles, rounded, clear smooth boundary 80–120 cm: Grayish-brown coarse sand fill with 40% small–medium subangular pebbles, water at 120 cm	None
7-1	7	104 cm	0–5 cm: Forest duff 5–53 cm: Light-brown silty loam with roots/rootlets and few pebbles 53–104 cm: Moist dark-brown to reddish-brown silty clay	Cellophane and partial plastic bottle cap near surface (modern)
7-2	7	44 cm	0–12 cm: Cedar bark mulch, brown 12–32 cm: Road gravel with fill, brown, heavily compacted 32-44 cm: Cedar bark mulch	None

Table B-1. Results of Shovel Test Probes in the APE

Shovel Probe Number	Survey Area	Maximum Depth Below Surface	Description	Cultural Materials Identified
8-1	8	100 cm	0–19 cm: Brownish-tan compact sand with ~50% rounded to subrounded gravel, poorly developed A Horizon 19–100 cm: Orangish-tan sand with ~50% round to subrounded gravel, more loosely consolidated with depth (probable B Horizon)	None
8-2	8	75 cm	0–2 cm: Duff 2–15 cm: O Horizon, Blackish-gray silt with 30% subrounded gravel and pebbles 15–75 cm: Tan loose silt with 30% subrounded gravel and pebbles, a few cobbles increasing with depth Terminated due to cobble density	None
9-1	9	44 cm	0–44 cm: Brown silty sand, disturbed fill, <20% gravel. Large root obstruction @44 cm	Brown bottle glass fragments and Pay-Less Drug Store plastic bag (modern)
9-2	9	15 cm	0–15 cm: Duff with ivy roots and brown silt, lots of modern debris. Terminated at asphalt surface	Asphalt/concrete flooring, glass fragments, asphalt shingle fragments, and red carpeting (Site 45SN609)
9-3	9	15 cm	0–15 cm: Brown and gray moderately dense silty duff with 25% gravel. Terminated at thin, plastic-coated wires (green and black) at 10 cm	Clear and green glass fragments (modern)
9-4	9	100 cm	0–100 cm: Brown sandy silt, 20% subrounded to subangular gravel, disturbed/redeposited fill	Asphalt and charcoal chunks (<=1 cm) throughout (modern)
9-5	9	100 cm	0–20 cm: Brown sandy silt, moderately loose with 5% gravel & pebbles 20–100 cm: Brown sandy silt, moderately loose	Glass sherds (modern)
10-1	10	77 cm	0–77 cm: Dark-black organic silt, little or no gravel, dry for top ~20cm, progressively wetter with depth. Standing water at 48 cm	Modern (<20 years) trash through upper 30–40 cm
10-2	10	60 cm	0–25 cm: Organic-rich peat with brown silt 5% gravel and many roots 25–60 cm: Grayish-blue sand with pockets of clay. Terminated due to root obstruction	None
11-1	11	75 cm	0–75 cm: Road fill, grayish-brown compact silt with 80% pebbles and gravels. Terminated due to compact gravel density	None
11-2	11	80 cm	0–80 cm: Brown fill material. Coarse sand, 50% medium angular pebbles	None
11-3	11	135 cm (auger @35 cm)	0–24 cm: Compact gray sand with 20% subrounded gravel and pebbles 24–135 cm: Loose dark gray sand with <5% subrounded gravel	34–42 cm, white plastic utility pipe in south wall running east–west

Table B-1. Results of Shovel Test Probes in the APE

Shovel Probe Number	Survey Area	Maximum Depth Below Surface	Description	Cultural Materials Identified
11-4	11	132 cm (auger @34 cm)	0–21 cm: Grass cover over very compact, very dry silty sand, 25-50% subrounded gravel and cobbles 21–132 cm: Large cobbles in sidewall to 34 cm, slightly moist sand, 25% subrounded gravel and cobbles. Terminated due to cobble obstructions	None
11-5	11	137 cm (auger @77 cm)	0–137 cm: Brown loosely consolidated sand and 20% rounded gravel becoming more compact and gray with depth. Possibly redeposited plus in situ glacial till, same as observed in cut slope northeast corner of park	None
12-1	12	82 cm	0–60 cm: Brown silty sand with subangular to subrounded pebbles and gravels 60–82 cm: Light-brown silty sand with subrounded pebbles and gravels	1 white glazed earthenware rim fragment, possibly plate or insulator (modern)
13-1	13	40 cm	0–40 cm: Extremely compact, dry brown silt loam with ~25% subrounded pebbles, gravels, and cobbles (glacial till)	None
13-2	13	30 cm	0–30 cm: Extremely compact, dry brown silt loam with ~25% subrounded pebbles, gravels, and cobbles (glacial till)	None

Archaeological Site Forms

STATE OF WASHINGTON
ARCHAEOLOGICAL SITE INVENTORY FORM

Smithsonian Number:
45SN531 Addendum
***County:** Snohomish

***Date:** 8/26/2012 ***Compiler:** Shari Maria Silverman

Location Information Restrictions *(Yes/No/Unknown)*: No **Human Remains?** ☐

SITE DESIGNATION

Site Name: Interurban Trail – Scriber Creek Segment

Field/ Temporary ID: 1792-2

***Site Type(s)** *(Refer to the DAHP Survey and Inventory Guidelines Page 19)*: Historic Railroad

SITE LOCATION

***USGS Quad Map Name(s):** Edmonds East, WA

***Legal Description: T**27N **R** 4 **E:** **Section(s):21**

Quarter Section(s): SE 1/4

UTM: Zone 10 **Easting** 552566 **Northing** 5295708

Latitude: **Longitude:** **Elevation (ft/m):**

Other Maps: **Type:**

Scale: **Source:**

Drainage, Major: Swamp Creek **Drainage, Minor:** Scriber Creek **River Mile:**

Aspect: SE **Slope:** 0

***Location Description** *(General to Specific)*: This section of the Interurban Trail/Railway alignment is located between Cedar Valley Road and 48th Street. It is north of I-5 and 212th Street, and south of 200th Street. The closest east-west oriented street is 206th Street, which is just north of the trail at its intersection with Cedar Valley Road.

***Directions** *(For Relocation Purposes)*: From the intersection of 212th Street SW and 52nd Avenue, drive north on 52nd Avenue for .25 mile (mi). Turn right (east) onto 208th Street SW. Proceed for .35 mi until the end of 208th Street SW. The Interurban Railroad is the bike trail that you cross to reach the parking area.

SITE DESCRIPTION

***Narrative Description:** East of 52nd Avenue, the Interurban Trail consists of a paved trail (Sketch Maps 1 and 2; Photos 1 and 2). No remnants of railroad (e.g., rails or ties) are visible at this location. The railroad grade has been capped with asphalt and concrete. A mowed grass lawn lines both sides of the trail within its right of way (ROW). Power lines, constructed after the Interurban's abandonment in 1939, line both sides of the ROW.

The following description of the Interurban Trail History is taken from the original Interurban Trail Site Form (Gilpin 2012):

"The electric railway line known throughout the region as the Seattle-Everett Interurban was initially conceived in 1900 by Fred Sander, the man responsible for both the Yesler Way cable car line and the Grant Street Electric Railway from Seattle to Georgetown (Bird 2000:2; Crowley 2003). Such electric rail lines were popular across the country in the early 20th century, as a fast and reliable form of commuter transportation between urban and suburban areas (Wing 1988:13-14). By 1906, the line extended from Ballard (a Seattle suburb located a few miles north of downtown) to Hall's Lake" (approximately .2 mile southeast of this segment of trail). This was described as 'a forested semi-wilderness'. "The railroad transported both passengers and lumber (Wing 1988:14). Sander installed trolley wire support poles on the east side of the tracks – this practice was followed through the life of the railway (Wing 1988:21 [Gilpin 2012])."

"A subsidiary of the Stone & Webster firm – who were already managing the Seattle – Tacoma Interurban electric railway (renamed the Puget Sound Electric Railway) – purchased Sanders' company in 1908, renaming it the Seattle – Everett Traction Company. In 1912, the company was reorganized as the Pacific Northwest Traction company, and Stone & Webster set about expanding the line north to Everett (an additional 14 mi) and rerouting the southern end of the line, in Seattle (Bird 2000:3; Crowley 2003, Wing 1988:15, 19 [Gilpin 2012])."

The line operated in this area from 1910 to 1939 (Bird 2000:3).

Water Resources *(Type)*__:__ Scriber Creek **Distance:** 650 ft

Permanence: Permanent

CULTURAL MATERIALS AND FEATURES

***Narrative Description:** On the surface, the Interurban Railway has been completely replaced by a trail paved with asphalt and concrete. No ties or other railroad components were visible on the grade within the study area. However, utility poles line both sides (north and south) of the trail.

Grade Components:

The grade is flush with the ground surface ROW. A small ditch lines the ROW. The trail is paved with asphalt. However, west of the its intersection with the 48th Avenue, a scored, concrete rectangle replaces the asphalt (Photo Concrete). It extends the width of the pavement, measuring 12 ft, 4 in wide (NW-SE). Its length measures 5 ft, 8 in (NE-SW). On each side of the intersection with 48th Avenue are upright wooden poles separating the trail from the road. A mowed grass ROW lines both the southern and northern edges of the paved grade. The total N-S width from grass edge to grass edge is 23 ft.

Utility Poles:

Utility poles stand along the grade's ROW on both the north and south side of the Interurban Trail (Sketch Maps 1 and 2). They are constructed of straight wooden poles hewn at the top. The poles

vary in age, style, and size. Some are short with metal arms extending from the central shaft or multi-tiered, horizontal bars (Photo 5). Others are taller. Outside of the recorded area, but still within the Interurban ROW, are double poles connected by horizontal bars (Photo 4). After the Interurban line was abandoned in 1939, Puget Power converted the railway to a power line corridor. Snohomish County Public Utility District No. 1 continues the operation of the utility line in this segment (Bird 2000:5).

Other Maps: **Type:**

Scale: **Source:**

Drainage, Major: Swamp Creek **Drainage, Minor:** Scriber Creek **River Mile:**

Aspect: 180° **Slope:** <5%

Location Description** *(General to Specific):** The concrete foundation and wall structure and debris are located in the Cedar Valley area of Lynnwood, Washington (Figure 1). The site is within the City of Lynnwood's Scriber Creek Park, at 20015 Cedar Valley Road, Parcel Number 00608400300101, just south of the intersection of Cedar Valley Road and 200th Street SW. Remnants of a concrete walkway within a dirt path can be seen in the grass-covered picnic area adjacent to the parking lot. The pathway leads to the densely vegetated area where the concrete structure and debris are located, slightly downhill from the picnic area (Figure 2).

Approach *(For Relocation Purposes)***:** From Seattle take Interstate-5 (I-5) North to Exit 181B (for 44th Ave W toward Lynnwood/WA-524). In approximately 0.3 miles, turn left onto 44th Avenue W, travel approximately 0.3 miles until 200th Street SW and turn left. Travel down 200th Street SW for approximately 0.4 miles and turn left onto Cedar Valley Road. Scriber Creek Park is approximately 279 feet south of the intersection of Cedar Valley Road and 200th Street SW.

SITE DESCRIPTION

***Narrative Description:** The site consists of historic aggregate concrete foundation wall segments and asphalt or concrete floor covered with deteriorating red carpet. The floor was identified during excavation of a shovel probe. From the foundation/floor area a pathway leads to aggregate concrete steps, an intersecting rock-lined wall, and a possible copper pipe handrail. To the south of the step area is a rock-lined dirt pathway (Figure 2). A scatter of domestic items was also observed, including: window glass fragments, composite roof shingle fragment, a 2-gallon Red Eagle gas can, a men's shoe sole, a clear glass bottle, a fragment of red rubber, and a Royal Crystal glass top, Edison screw-base fuse.

Site Type** *(Refer to the DAHP Survey and Inventory Guidelines Page 19):** Historic Structure-Unknown

Water Resources *(Type)***:** Scriber Creek, marsh/pond **Distance:** 10 m East

Permanence: Permanent

CULTURAL MATERIALS AND FEATURES

***Narrative Description:** Historic aggregate concrete foundation walls and segments, w/ path leading to aggregate concrete stairs to the south and intersecting cobble & concrete walls. Possible copper pipe handrails by stairs, one section still set in concrete block. ~10 m south of stairs is a cobble-lined dirt path leading from parking area. Artifacts on site include window glass fragments; composite roof shingle fragments; red rug portion over aggregate concrete floor; red Eagle 2-gallon fuel can; Royal Crystal screw-in fuse; shoe sole; brown glass bottle fragments; red rubber fragment; section of PVC pipe; various dissociated chunks of aggregate concrete; 2 sections of aggregate concrete with a tall edge on one side and 3" tall base on raised side; clear glass bottle with screw-type cap with ABM underlined "6" on base; 30 cm high and 7 cm diameter.

There are also two additional segments of aggregate concrete wall/foundation in the southern part of the park that may or may not be associated with the site location. The age of the concrete remnants is undetermined and no additional artifacts were associated in conjunction with the location (near Shovel Probe 9-5), therefore, it was not included in this site form.

***Method of Collection(s):** Not collected

SITE HISTORY

Previous Work *(Done on Archaeological Site)***:** None

Site History

The first record of Euroamerican landownership for the Scriber Creek Park Site was from the late nineteenth century. According to Bureau of Land Management General Land Office (GLO) documentation, the area was part of a land patent record for Alexander Brunnell, a Finnish settler who was one of the original settlers in the Cedar Valley area (GLO 2012a). Two structures are shown on the 1895 topographic map at the end of a pathway/roadway at the site area (USGS 1895). The pathway/roadway appears to be the same alignment as the current Cedar Valley Road. The land patent was for 80 acres and was issued on November 32, 1891 (BLM Serial No. WASAA 072207). Brunnell only lived on the land for approximately 6-7 years (Polk Directory 1894). His obituary, dated August 24, 1899, indicates that he lived on the county poor farm for two years (Snohomish County Tribune 1899). Other notable settlers in the area include Peter Schreiber (for whom Scriber Lake, Scriber Creek, and the associated parks are named), Pope, Talbot, and Walker (of Pope and Talbot Mill fame), and William Loughridge (GLO 2012b-d).

By 1910, the site area was owned by Erick A. Wallene (Anderson Map Company 1910). Historic maps from the early 20th century show the area became more popular and several housing developments were established. The land owned by Wallene was later divided into the Wallene Interurban Tracts (Metsker 1927; Kroll Map Company 1934; Kroll Map Company 1943 revised 1952; Metsker 1960). A few dwellings were also documented on topographic maps at the site location; one of which appears to coincide with a structure seen on the 1895 map (USGS 1895, 1942, and 1953). Detailed landowner documentation is scarce for the time between Wallene's ownership and the late 1960s-early 1970s. By 1971, the parcel was owned by Walter W. Sprague (Snohomish County Assessor 2012). Mr. Sprague deeded a strip of land to the City of Lynnwood in 1986 and by 1991 the City had purchased the entire parcel (Snohomish County Assessor 2012). The parcel became a passive park (Scriber Creek Park) in 1991 and in 1995 the City added a paved parking lot near the site location (City of Lynnwood 2012; Snohomish County Assessor 2012).

Re: Receipt of Draft Environmental Impact Statement, No Adverse Effect

Dear Mr. Feldman:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP). The Lynnwood Link Extension Light Rail project has been reviewed on behalf of the State Historic Preservation Officer under provisions of Section 106 of the National Historic Preservation Act of 1966 (as amended) and 36 CFR Part 800. My review is based upon documentation contained in your communication.

Thank you for submitting the draft Environmental Impact Statement Summary. We have reviewed the document and concur with your preliminary finding that the project, as described, will have no adverse effect on historic properties and/or archaeological sites within the area of potential effects identified for the project.

If additional information on the project becomes available, construction plans are altered, or if any archaeological resources are uncovered during construction, please halt work in the area of discovery and contact the appropriate Native American Tribes and DAHP for further consultation.

Thank you for the opportunity to review and comment. If you have any questions, please contact me.

Sincerely,

Matthew Sterner

Re: NOT Eligible

Dear Mr. Drais:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP). The above referenced property has been reviewed on behalf of the State Historic Preservation Officer under provisions of Section 106 of the National Historic Preservation Act of 1966 (as amended) and 36 CFR Part 800. My review is based upon documentation contained in your communication dated April 3, 2013. This is in regard to additional inventory forms (Batch 4) for the Lynnwood Link Extension.

Our understanding is that refined alternatives for the project necessitate an adjustment of the APE and we concur with this revision. Such revisions included an additional 12 historic resources found at the proposed 220th Street location.

I have reviewed the following properties:

15408 2nd Ave NE
15414 2nd Ave NE
15450 4th Ave NE
15451 4th Ave NE
15455 4th Ave NE
15459 4th Ave NE
302 NE 155th St
303 NE 155th St
308 NE 155th St
309 NE 155th St
314 NE 155th St
315 NE 155th St

Based on the low level of architectural integrity of these properties, I concur with your assessment that they are NOT ELIGIBLE for the National Register of Historic Places. As a result of this finding, further contact with DAHP is not necessary regarding any alterations to these structures. However, if additional information on the property becomes available, or if any archaeological resources are uncovered during construction, please halt work in the area of

discovery and contact the appropriate Native American Tribes and DAHP for further consultation.

Thank you for the opportunity to review and comment. Should you have any questions, please contact me.

Sincerely,

Michael Houser
State Architectural Historian

Re: NOT Eligible

Dear Mr. Powell:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP). Per your request, I have reviewed the last group of historic property inventory forms (HPIF's) for the **Lynnwood Link light rail extension project** on behalf of the State Historic Preservation Officer under provisions of Section 106 of the National Historic Preservation Act of 1966 (as amended) and 36 CFR Part 800. This group of inventory forms roughly covers the area between 238th St SW and 200th St SW. My review is based upon documentation contained in your communication.

Research indicates that none of the inventoried properties are currently listed in the Washington Heritage Register or National Register of Historic Places. After careful evaluation I have determined that none of the inventoried properties in Batch 3 rise to the level of eligible for listing on the National Register of Historic Places. I have attached a matrix which outlines these determinations for your files.

Overall the project has generated 646 HPIF's of which DAHP has determined 5 resources Eligible for listing on the NRHP. As a reminder these are as follows:

- 13130 5th Ave. NE (Church Parsonage),
- 11725 1st Ave NE (Northgate Elementary),
- 132 NE 155th St (Toyonaga property),
- 6205 222nd St SW (Melody Hill School).
- 11200 1st Ave NE (Northgate Plaza)

We look forward to working with you in the coming months as you determine if the project will have any effect on these eligible resources, and if so determining what mitigation might be. Thank you for the opportunity to review and comment. Should you have any questions, please contact me.

Sincerely,

Michael Houser
State Architectural Historian

Re: Concur on Five Eligible Properties

Dear Mr. Drais:

Thank you for contacting our office. Mr. Michael Houser and I have reviewed the materials you provided to our office. Our review comments are as follows:

- We concur that the four built environment properties identified by your consultant are eligible for listing in the National Register of Historic Places (NRHP). These include the properties at 13130 5th Ave. NE (Church Parsonage), 11725 1st Ave NE (Northgate Elementary), 132 NE 155th St (Toyonaga property), and 6205 222nd St SW (Melody Hill School).
- Mr. Houser also identified an additional property that he believes is eligible for listing in the NRHP, the Northgate Plaza property at 11200 1st Ave NE. Unless you have objections, DAHP would like to list this property in our Historic Property Inventory database as *eligible* for listing in the NRHP.
- After reviewing the archaeological site forms submitted for a segment of the former Interurban Railway alignment and the Scriber Creek Park site (please have a Smithsonian trinomial assigned at your earliest convenience), I concur with your determination that the Scriber Creek Park site is not eligible for listing in the NRHP. I do appreciate your determination that the remnant of the Interurban alignment is a continuation of a previously identified resource (45SN531) and appending that site form with the newly discovered segment of that resource. Since this is a small fraction of the resource known as the Interurban Railroad, and the objective of this undertaking was not to evaluate the entire resource, I will concur that the segment defined within your area of potential effect can be considered a 'non-contributing segment' to the larger resource known as the Interurban Railway alignment.

We look forward to further consultation regarding your determination of effect to those resources that are eligible for listing in the NRHP.

I would appreciate receiving any correspondence or comments from concerned tribes or other parties that you receive as you consult under the requirements of 36CFR800.4(a)(4) and the survey report when it is available.

Re: NOT Eligible

Dear Mr. Krochalis:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP). Per your request, I have reviewed the first group of historic property inventory forms (HPIF's) for the **Lynnwood Link light rail extension project** on behalf of the State Historic Preservation Officer under provisions of Section 106 of the National Historic Preservation Act of 1966 (as amended) and 36 CFR Part 800. This group of inventory forms roughly covers the area between NE 170th St and the Snohomish County line at NE 205th Street. My review is based upon documentation contained in your communication.

Research indicates that none of the inventoried properties are currently listed in the Washington Heritage Register or National Register of Historic Places. After careful evaluation I have determined that none of the inventoried properties rise to the level of eligible for listing on the National Register of Historic Places. I have attached a matrix which outlines these determinations for your files. Please note that this differs slightly from your consultant's determination which believed that two properties were eligible for listing. While these two resource have a moderate level of architectural integrity, they do not rise to the level of individual listing on the National Register.

I look forward to a second group of inventoried properties within the APE for this project in the coming weeks. Thank you for the opportunity to review and comment. Should you have any questions, please contact me.

Sincerely,

Michael Houser
State Architectural Historian

1 INTRODUCTION

An ecosystem is defined by the interaction between plants, animals, microorganisms, and the physical environment in which they live. Ecosystems consist of living organisms, including humans, and the environment they inhabit. Understanding this relationship is basic to the environmental review process and the assessment of impacts on ecosystems.

This technical report addresses the ecosystem components—aquatic species and habitat; vegetation, terrestrial wildlife, and wildlife habitat; and wetlands—in the vicinity of the Lynnwood Link Extension alternatives. The report describes the affected environment as well as the expected long-term and construction-related impacts on these ecosystem resources for each of the project alternatives. It also discusses measures intended to avoid and minimize impacts, including compensatory mitigation for unavoidable impacts.

This report is organized into four main parts, beginning with a summary of data-gathering activities, identification of related laws and regulations, definition of the study area, and assumptions (Chapter 1); followed by Chapter 2, Study Objectives and Methods; Chapter 3, Affected Environment; and Chapter 4, Environmental Consequences. Appendices A through D provide additional project-related information and site photographs.

1.1 Data Gathered

The Central Puget Sound Regional Transit Authority (Sound Transit) performed a literature and data review to identify and characterize potentially affected resources in and near the project area. Before the field reconnaissance, existing documentation and information were compiled and reviewed so that the reconnaissance effort could focus on verifying data and filling information gaps. Existing ecosystem resource information was gathered from many local, state, and federal agencies. These information sources included published and unpublished reports, maps, Web sites, aerial photographs, and communication with agency staff familiar with resources within the project vicinity. The data sources are listed in the following subsections.

1.1.1 Agency and Public Contacts

Sound Transit contacted the following agencies and local jurisdictions:

- Washington State Department of Transportation (WSDOT)
- City of Seattle
- City of Shoreline
- City of Mountlake Terrace
- City of Lynnwood

1.1.2 Maps and Existing Documentation

Maps and other existing documents were an important resource used to identify ecosystem features within the project vicinity. The following resources were reviewed:

- National Wetlands Inventory (NWI) data (U.S. Fish and Wildlife Service [USFWS])
- Natural Resources Conservation Service (NRCS) Soil Survey maps
- Priority Habitats and Species (PHS) data (Washington Department of Fish and Wildlife [WDFW])
- SalmonScape fish data and maps (WDFW)
- StreamNet data and maps (StreamNet)
- City of Seattle *State of the Waters 2007* report (City of Seattle 2007)
- Basin characterization reports of Thornton Creek/West Lake Washington (Tetra Tech/KCM 2004a) and McAleer Creek/Lyon Creek (Tetra Tech/KCM 2004b)
- Stream habitat analysis for the City of Lynnwood (Jones and Stokes 2000)
- Swamp Creek Urban Growth Area Drainage Needs Report, including Scriber Creek Subbasin (Snohomish County 2002)
- *Salmon and Steelhead Habitat Limiting Factors Report for the Cedar-Sammamish Basin* (Kerwin 2001)
- Washington State Department of Natural Resources (DNR) Natural Heritage Program database
- *A Catalog of Washington Streams and Salmon Utilization, Volume 1, Puget Sound Region* (Williams et al. 1975)
- Critical area maps from local jurisdictions (Cities of Seattle, Shoreline, Mountlake Terrace, Lynnwood, King County, and Snohomish County)
- *Sound Transit 2 Mitigation: Impact Summary and Analysis Memorandum*, as well as geographic information system (GIS) data (ESA Adolfson 2010)
- Aerial photography of the project corridor (including the King County aerial photography database or Google Earth database)
- Regulatory compliance documents, such as the *North Link Light Rail Transit Project Final Supplemental Environmental Impact Statement* (Sound Transit 2006), critical area studies, wetland delineation reports, and stream studies by other agencies or consulting firms, as available
- Lists of listed and proposed endangered and threatened species and critical habitat, candidate species, and species of concern in King and Snohomish counties (USFWS)
- Endangered Species Act Status of West Coast Salmon and Steelhead List (National Oceanic and Atmospheric Administration, National Marine Fisheries Service [NOAA Fisheries])
- Salmon Critical Habitat Designation Maps (NOAA Fisheries)
- USFWS Critical Habitat Maps for Threatened and Endangered Species
- List of Migratory Birds Protected by the Migratory Bird Treaty Act

1.2 Guiding Regulations, Plans, and/or Policies

Wetlands, vegetation, aquatic species and their habitat, wildlife and their habitat, and threatened and endangered species that may be affected by project activities are subject to the following regulations, plans, and policies:

Federal

- National Environmental Policy Act (NEPA)
- Sections 404, 402, and 401 of the Clean Water Act (CWA)
- Section 7 of the Endangered Species Act (ESA)
- Magnuson-Stevens Fishery Conservation and Management Act
- Bald and Golden Eagle Protection Act
- Migratory Bird Treaty Act
- Protection of Wetlands, Presidential Executive Order 11990
- Final Rule on Compensatory Mitigation for Losses of Aquatic Resources (2008)
- U.S. Army Corps of Engineers (Corps) Wetland Delineation Manual (1987)
- *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region, Version 2.0* (Corps 2010)
- Coastal Zone Management Act

State

- Washington State Environmental Policy Act (SEPA)
- Hydraulic code (Washington Administrative Code [WAC] Chapter 220-110)
- Shoreline Management Act
- Washington State Growth Management Act
- Protection of Wetlands, Governor's Executive Order 89-10
- Protection of Wetlands, Governor's Executive Order 90-04
- Water Pollution Control Act 90.48 Revised Code of Washington (RCW)
- Wetland Mitigation in Washington State (Ecology et al. 2006)

Local

- Critical Area Ordinances for local jurisdictions (Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood)

Miscellaneous

- *Thornton Creek Draft Watershed Action Plan* (Thornton Creek WMC 2001)
- *Greater Lake Ballinger/McAleer Creek Watershed Study Draft Strategic Action Plan* (Otak et al. 2009)
- Sound Transit Environmental Policy (April 2004)
- Sound Transit Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)
- Sound Transit Sustainability Plan (June 2011)

1.3 Study Area

1.3.1 Aquatic Species and Habitat

The study area for aquatic species and habitat includes all streams within 200 feet of the project alternatives or features; however, the description of the affected environment will acknowledge ecosystem features such as streams or natural corridors that are partly within or cross through the field reconnaissance survey area. For example, for streams, the study area will extend up to 100 feet upstream to 300 feet downstream (in accordance with WAC 73-201A-400) from where project limits cross the stream, as well as the entire stretch of any stream paralleling the project within 200 feet of the edge of the alternative. A wetland and stream ordinary high water mark (OHWM) delineation was performed along the Preferred Alternative alignment (approximately 100 feet on each side beyond the construction limits for the Preferred Alternative; this area is referred to as the delineation area). The purpose of the OHWM delineations was to refine resource boundaries and update information for the Final Environmental Impact Statement (Final EIS).

1.3.2 Vegetation, Terrestrial Wildlife, and Wildlife Habitat

The study area for vegetation and wildlife habitat includes the project alignment or related facility footprint (i.e., the area in which clearing, grading, and the operation of construction machinery would disturb existing habitat) plus all areas within 200 feet of the project alternatives. This is the area in which project construction could affect vegetation cover and habitat quality for terrestrial wildlife species that may occur in the area. To evaluate wildlife potentially affected by project-related noise and human activity, project biologists also reviewed documented occurrences of sensitive wildlife species within 0.25 mile of the project alternatives.

1.3.3 Wetlands

The study area for wetlands encompasses the area within 200 feet of either side of the project alternatives or features. Within this area, a field reconnaissance survey was conducted during the Draft EIS phase to identify, map, and describe wetlands. The field reconnaissance survey area consisted of public rights-of-way administered by WSDOT or other public agencies within the study

area. Portions of wetlands that extended beyond the field reconnaissance survey area and other potential wetlands outside of this survey area were identified based on visual observation from public areas during the field survey; current local, state, and federal wetland maps; critical area reports; and aerial photographs. A wetland and stream OHWM delineation was performed along the Preferred Alternative alignment (approximately 100 feet on each side beyond the construction limits for the Preferred Alternative). The purpose was to refine resource boundaries and update information for the Final EIS. Wetland descriptions in this assessment include those wetlands that are partly within or cross through the study area.

1.4 Assumptions

1.4.1 Impact Assessment

This ecosystems impact assessment is based on examining the data from overlaying the conceptual designs for the light rail alternatives onto ecosystem resource base maps and applying an additional buffer (10 to 12 feet) to account for other features such as noise walls and retaining walls. The project footprint includes the guideway, station footprints (including parking), roadway improvements, storm drainage ponds, and ancillary features. Not all areas within the 10- to 12-foot analytical buffer on the project footprint would be subject to long-term impacts; some areas would be unaffected under the light rail alternatives or would be subject only to temporary impacts during construction. The acreage values resulting from this analytical approach provide a reasonable indication of the nature and magnitude of potential impacts and reflect differences among alternatives. To provide a conservatively high estimate of impacts, all impacts within these areas are considered long-term effects for this analysis. Although these analytical buffers represent a conservative estimate of the areas where long-term effects may occur, some impacts could take place outside of these areas. For example, some trees in areas adjacent to the analytical buffer may need to be removed to protect light rail safety and reliability. Removal of such hazard trees may accompany construction of any of the light rail alternatives, and it may continue as a maintenance activity during the operational life of project facilities.

Sound Transit will identify detailed temporary construction limits during the permitting phase to distinguish which ecosystem resources could be restored. Although detailed construction limits are not defined at this phase in the project design, potential construction limits have been estimated in the vicinity of streams, stream buffers, wetlands, and wetland buffers. These consist of areas where temporary impacts could extend beyond the analytical buffer defined for the analysis of long-term impacts. For the analyses of temporary construction impacts on vegetation in this technical report and the EIS, it is assumed that the level of temporary construction impacts would be commensurate with the level of long-term impacts.

The elevated guideway may create a rain shadow effect and in some cases would have a low clearance that could limit sunlight to vegetation underneath. This analysis conservatively assumes that the area under the elevated guideway would be a long-term impact on wetlands, wetland buffers, riparian buffers, and vegetation because of shading and precipitation interception from the

structure. However, shrubs and herbaceous plants may be able to grow in some areas where the guideway is high enough above the ground and where stormwater runoff from the guideway can be directed to underlying plants. Sound Transit will re-evaluate this assumption during the permitting phase to identify specific situations where ecosystem resources under the elevated guideway do not have a long-term impact and could be restored. Estimating this impact is complicated and depends on multiple variables, such as slope, aspect, soil conditions, and stormwater dispersion from the elevated guideway. All these variables make for a complicated impact analysis that exceeds the site and design information available during EIS development. It is assumed that permanent impacts on wetlands associated with elevated sections of the alternatives can be avoided or further minimized during final design and construction.

1.4.2 Site Restoration

For purposes of analysis and discussion of temporary construction impacts, Sound Transit assumes that areas supporting native upland or wetland vegetation and riparian corridors located outside of the project limits would be restored after construction is completed. Site restoration features would be installed immediately following construction in each project segment. The length of time that would be required for site restoration to effectively replace pre-project wetland functions would vary.

1.4.3 Avoiding and Minimizing Impacts on Sensitive Ecosystem Resources

Sound Transit assumes that best management practices (BMPs) would be implemented at appropriate locations and that they would perform as intended to avoid or minimize impacts. Also, where possible, project features would be designed and located to avoid or minimize impacts on sensitive resources. For example, support columns and fill slopes would be situated outside of sensitive areas to the maximum extent practicable. Appendix A provides a compilation of BMPs that could be used to avoid or minimize project construction and operational impacts on sensitive ecosystem resources, including state and federal protected species and their habitats, wetlands, and aquatic resources. These BMPs are either required by state or federal agencies to obtain the permits that would be necessary for the project or may be required to comply with permit conditions.

2 STUDY OBJECTIVES AND METHODS

This chapter describes the objectives and methods used to study the aquatic species and habitat; vegetation, terrestrial wildlife, and wildlife habitat; and wetland resources. Sound Transit and the Federal Transit Administration (FTA) also prepared and circulated the *Lynnwood Link Technical Methodologies Report* in April 2012, and invited cooperating and participating agencies to review and comment. The following discussion summarizes the approach defined in the original methodologies report but also incorporates further detail that became available after field surveys and other reconnaissance were complete.

2.1 Aquatic Species and Habitat

2.1.1 Study Objectives

This technical report is intended to provide information in support of Sound Transit's NEPA and SEPA analyses, assist project planning, and facilitate permitting. Discussions in this report identify and describe aquatic habitats and species in the study area, evaluate the potential impacts of each alternative within each segment, and describe measures to avoid, minimize, or compensate for impacts.

2.1.2 Methods

Aquatic species and habitat (streams) were identified through existing maps and documents, communication with local municipality staff, a field reconnaissance, and OHWM delineation. State and local regulations and guidance were reviewed to assist in identifying stream types and to confirm project compliance with existing laws.

Review of Existing Information

Sound Transit reviewed existing information to identify and characterize aquatic species and habitats that would be potentially affected by the project (see Section 1.1.2). Sources were reviewed to collect information regarding the presence of resident and anadromous fish species and habitat (streams) near the study area. For this analysis, fish species with the potential to be present in a particular stream segment (based on the species' range, habitat associations, and expected upstream extent of use in the stream in question) were assumed to be present, unless their absence was documented. Existing maps and documentation were gathered, reviewed in the office, and then evaluated in the field within the reconnaissance survey area. Existing digital GIS data were gathered from the Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood. GIS data from previous reconnaissance work performed for the Sound Transit 2 light rail projects (ESA Adolfson 2010) were also reviewed.

Agency Coordination

Staff members from the Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood were contacted regarding their critical area maps and any other resources that may have been identified

subsequent to finalization of these maps. Staff members from WSDOT were contacted regarding plans for potential future fish passage improvement projects.

Identification of Threatened, Endangered, and Candidate Species

Sound Transit reviewed several data sources to determine the known or expected presence of ESA-listed threatened or endangered species in study area streams, or of species that are proposed for listing. Sources included online data from SalmonScape (WDFW 2014a) and PHS (WDFW 2014b), as well as reports prepared by the City of Seattle (2007), Tetra Tech/KCM (2004a, 2004b), Jones and Stokes (2000), and Kerwin (2001). The potential for individual species to use habitats in the Lynnwood Link Extension study area was evaluated based on documented observations and the known or expected upstream extent of each species' use of each stream.

Stream Classifications and Buffer Width Designations

Streams in the study area were assigned preliminary classifications based on the systems used by the Cities of Seattle[1], Shoreline, Mountlake Terrace, and Lynnwood, respectively. Each of these stream classification systems classifies and assigns protective buffers to streams based on the presence of fish and whether water flow is perennial or seasonal. Each system is hierarchical; that is, a stream is assigned to a particular category only if it does not meet the criteria of any higher ranking categories.

Identification and classification of streams in this report represent conservative estimates, based on available information and the provisions of local critical areas rules. The purpose of the preliminary assignments in this document was to identify stream buffer areas that could be affected under the light rail alternatives to allow a comparison of the potential effects of the alternatives. For stream segments that may be affected by project construction, stream classification determinations will be made in accordance with the applicable local jurisdiction's critical areas ordinance during the permitting phase of this project. These determinations will also be informed by determinations of presumed fish use according to WAC 222-16-031. Some of the watercourses identified in this analysis may not actually be defined as streams by the local jurisdictions, or they may be assigned smaller buffers.

The categories of the City of Seattle classification system (Seattle Municipal Code 25.09.020) are as follows:

- **Type 1:** Waters inventoried as "shorelines of the state" under RCW Chapter 90.58, but not including periodically inundated areas of their associated wetlands
- **Type 2:** Segments of natural waters that have high value to fish for spawning, rearing, or migration (i.e., having a defined channel width of at least 20 feet and a gradient less than 4 percent), or that are used for off-channel habitat
- **Type 3:** Segments of natural waters that have moderate to slight value to fish for spawning, rearing, or migration (i.e., having a defined channel width of at least 2 feet and a gradient less than 16 percent)

[1] Only applicable to development on publicly or privately owned parcels.

- **Type 4:** Segments of natural waters with perennial flow, lacking fish habitat
- **Type 5:** Segments of natural waters with seasonal flow only, lacking fish habitat

The categories of the City of Shoreline classification system (Shoreline Municipal Code 20.80.470) are as follows:

- **Type I:** Streams identified as "shorelines of the state" under the City's Shoreline Master Program
- **Type II:** Streams that are used by or that have habitat value for salmonids
- **Type III:** Streams with a channel width of at least 2 feet that are not used by salmonids
- **Type IV:** Streams with a channel width less than 2 feet that are not used by salmonids
- **Piped stream segments:** Segments of streams, regardless of their type, that are fully enclosed in an underground pipe or culvert

The categories of the City of Mountlake Terrace classification system (Mountlake Terrace Municipal Code 16.15.080) are as follows:

- **Class I:** Natural streams identified as "shorelines of the state" under the City's Shoreline Master Program
- **Class II:** Natural streams that have documented or significant potential for anadromous fish use
- **Class III:** Natural streams that are not used by anadromous fish
- **Class IV:** Natural streams with a channel width less than 2 feet that are not used by salmonid fish
- **Class V:** Natural streams that are seasonal and do not contain fish

The categories of the City of Lynnwood classification system (Lynnwood Municipal Code 17.10.060) are as follows:

- **Category I:** Scriber Creek, Swamp Creek, Lunds Creek, and Halls Creek
- **Category II:** Streams that flow year-round or that are used by salmonids
- **Category III:** Streams that are naturally intermittent and are not used by salmonids

Cities have jurisdiction over stream buffers, which are regulated through each City's Critical Areas Ordinance. Table 2-1 lists the stream buffer widths for the various stream classifications. The distances presented below are minimum requirements; wider buffers may be required in response to site-specific conditions (e.g., the presence of ESA-listed fish species) or the type and intensity of proposed uses.

Table 2-1. Minimum Buffer Requirements for Streams in the Study Area by Local Jurisdiction

Jurisdiction	Stream Classification	Buffer Requirement (feet)
City of Seattle[a]	Type 1	100 feet
	Type 2/3 – anadromous fish	75 feet
	Type 2/3 – no anadromous fish	50 feet
	Type 4	50 feet
	Type 5	50 feet
City of Shoreline[b]	Type I	115 feet
	Type II	75 feet
	Type III	35 feet
	Type IV	25 feet
	Piped	10 feet
City of Mountlake Terrace[c]	Class I	150 feet
	Class II	100 feet
	Class III	65 feet
	Class IV	50 feet
	Class V	Based on review
City of Lynnwood[d]	Category I	100 feet
	Category II	60 feet
	Category III	35 feet

[d] Lynnwood Municipal Code 17.10.060 and 17.10.061

Stream Determination and Field Investigations

A detailed field reconnaissance survey was conducted in the study area to identify, map, and describe aquatic species (fish) and habitat (streams) within public rights-of-way (i.e., the field reconnaissance survey area; see Section 1.3) during the Draft EIS phase. General information was collected in the field at that time and stream courses were estimated and mapped using global positioning system (GPS). These documented streams were included in the aquatic species and habitat findings in the Draft EIS. During the Final EIS phase, biologists performed a wetland and stream OHWM delineation in areas approximately 100 feet on each side beyond the construction limits for the Preferred Alternative (i.e., the delineation area; see Section 1.3). The purpose of the OHWM delineations was to refine resource boundaries and update information for the Final EIS. Data from the delineation field work amends those previously collected during the field reconnaissance survey.

Segments of streams or potential streams beyond the delineation area and outside of the WSDOT or other public rights-of-way were identified based on field reconnaissance from public areas; current local, state, and federal habitat maps and reports; and aerial photographs. These areas outside of the WSDOT or other public rights-of-way that appear to be streams were included in the EIS stream findings to provide a conservative estimate of the alternatives' impacts.

Reconnaissance-level aquatic habitat surveys were conducted 300 feet downstream and 100 feet upstream of each proposed stream crossing, and along the entire stretch of any stream paralleling the project within 200 feet from the edge of an alternative. Aquatic habitat suitability (functional

status) was evaluated based on fish life histories, spawning and rearing habitat requirements, seasonal use, and field observations. The following stream habitat information was obtained during a pre-field review of existing literature, supplemented by qualitative observations gathered during the field reconnaissance: overall rating, water quality, in-stream habitat, riparian habitat, and anthropogenic factors. Additionally, aquatic species habitat was described, when possible and applicable, in a subbasin context. Habitat was assessed with the assumption that anadromous fish may one day be able to access the area even if they cannot under present conditions. To the extent information was currently available or could be readily ascertained in the field, downstream impediments to fish passage were identified for each stream reach.

Mapping

Each stream identified in the study area received a unique identifier that was tracked in a GIS database. Within the delineation area, biologists flagged the OHWM of streams, which professional land surveyors then surveyed. For segments of streams identified during the field reconnaissance that are beyond the delineation area, the OHWM was estimated and mapped using GPS. All data were incorporated into the project GIS. Streams that extend beyond the field reconnaissance survey area and other previously mapped streams outside of the WSDOT or other public rights-of-way were also incorporated into the GIS database. The OHWMs of all streams that may be affected by construction of the Preferred Alternative have been delineated. Final stream classification determinations, in accordance with local jurisdictions' critical areas ordinances, will be made during the permitting phase of this project.

Impact Assessment

To evaluate the impacts on aquatic resources, the project and construction limits were overlain onto ecosystem resource base maps. The project limits include the guideway, station footprints (including parking), roadway improvements, storm drainage ponds, ancillary features, and analytical buffer (Section 1.4.1, Impact Assessment). Impact areas were determined as the area of intersection between the project and construction limits and the stream and/or buffers. This assessment also considered loss of riparian function (based on the amount of clearing, filling, and/or excavation as a result of the project) and other direct and indirect impacts on streams. The impacts assessment for aquatic resources also considered differences in the amount of impervious surface under the alternatives, as well as impacts related to changes in water quality.

2.2 Vegetation, Terrestrial Wildlife, and Wildlife Habitat

2.2.1 Study Objectives

This technical report is intended to provide information in support of Sound Transit's NEPA and SEPA analyses, assist project planning, and facilitate permitting. Discussions in this report identify and describe vegetation and wildlife resources in the study area, evaluate the potential impacts of each alternative within each segment, and describe measures to avoid, minimize, or compensate for impacts.

2.2.2 Methods

To establish the basis for analyzing the effects on vegetation, terrestrial wildlife, and wildlife habitat, Sound Transit delineated and classified land cover on aerial photographs and visited a sample of these areas during the field reconnaissance survey. Major plant communities and habitat types were identified and classified based on the structural categories defined in *Wildlife-Habitat Relationships in Oregon and Washington* (Johnson and O'Neil 2001).

To support the analysis of effects on wildlife, Sound Transit identified wildlife species that are associated with the land cover types in the study area, and with specific habitat elements within each cover type. Sound Transit also assessed locations of known ecologically sensitive areas and important wildlife occurrences that may be sensitive to disturbance from noise or human presence. This information was supplemented with data gathered during the field reconnaissance and delineation visits.

Sound Transit reviewed Natural Heritage Program data from DNR for known locations of rare plant species or rare plant communities within the study area. They also studied PHS data for known locations of wildlife species that are listed or proposed for listing under ESA or that are a management concern for WDFW, as well as habitats with unique or significant value. Each major plant community and habitat type that exists in the study area is described in this report. The relative function of each plant community in providing habitat for wildlife is described based on reconnaissance-level field observations, literature review (including *Wildlife-Habitat Relationships in Oregon and Washington* [Johnson and O'Neil 2001]), professional opinion, and agency consultation. Sensitive information regarding the locations of proposed, candidate, and listed species and habitats is not mapped to protect the integrity of this information.

Biologists conducted a limited field reconnaissance to verify habitat mapping and to observe wildlife species in the vicinity of the study area. A wildlife biologist conducted a site visit on March 30, 2012. Biologists conducting site visits to gather data on wetlands and streams also collected data on wildlife use of the area between March and July 2012 and between July 2013 and July 2014. No formal surveys were conducted for any wildlife species. However, if the project alternative site were located within the known or expected range of a particular species, and if habitat for that species were present within the study area, then the species was assumed to be present.

Sound Transit evaluated the potential effects of the proposed action on vegetation and wildlife using a variety of methods and resources, including the following:

- GIS analysis to determine the acreage, type, and location of affected cover types
- Review of existing literature on the effects of project construction, use, and maintenance on vegetation and wildlife
- Review of WDFW management recommendations for priority habitats and species

To evaluate the impacts to vegetation and wildlife resources, project limits were overlain onto ecosystem resource base maps in GIS. The project limits include the guideway, station footprints (including parking), roadway improvements, storm drainage ponds, ancillary features, and analytical

buffer (Section 1.4.1, Impact Assessment). Impact areas were determined as the area of intersection between the project limits and land cover.

2.3 Wetlands

This section describes the study objectives and methods used to characterize wetlands within the study area and to identify potential impacts.

2.3.1 Study Objectives

This technical report is intended to provide information in support of Sound Transit's Lynnwood Link Extension NEPA and SEPA analyses, assist project planning, and facilitate permitting. Discussions in this report identify and describe wetland resources in the study area, evaluate the potential impacts of each alternative within each segment, and describe measures to avoid, minimize, or compensate for impacts.

Existing data and previous reconnaissance surveys show that wetlands are located within the project limits for all project alternatives. As a result, specific objectives of this study include the following:

- Identify, map, and describe the existing conditions of the wetlands and wetland buffers located within 200 feet of either side of the proposed project alternatives
- Delineate wetlands within approximately 100 feet on each side of the Preferred Alternative
- Determine each project alternative's impacts on wetlands
- Describe measures to avoid, minimize, or compensate for impacts

2.3.2 Methods

Wetlands were identified through existing maps and documents, communication with local municipality staff, a field reconnaissance, and a delineation. Federal, state, and local regulations and guidance were consulted to assist in classifying and rating wetlands and to confirm project compliance with existing laws.

Review of Existing Maps and Documentation

Existing maps and documentation were gathered from a variety of sources (see Section 1.1.2), reviewed in the office, and then evaluated in the field within the field reconnaissance survey area. Existing digital GIS data were gathered from the Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood; the USFWS NWI; and Sound Transit (previous reconnaissance performed for the Sound Transit 2 light rail projects [ESA Adolfson 2010]).

Agency Coordination

Sound Transit contacted staff from the Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood for their critical area maps and any wetlands that may have been identified subsequent to finalization of these maps. This search included documentation associated with recent permit applications or code violations.

Wetland Determination and Field Investigations

Wetlands were identified in the field reconnaissance survey area (defined as the area within 200 feet of either side of the project alternatives or features within public rights-of-way) during the Draft EIS phase. During the Final EIS phase, biologists delineated wetlands on parcels where rights of entry could be obtained within approximately 100 feet of the construction limits for the Preferred Alternative (i.e., the delineation area; see Section 1.3). The criteria used for wetland delineations were those provided in the *Corps of Engineers Wetland Delineation Manual* (1987) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region Version 2.0* (2010). Within the delineation area on properties where rights of entry were obtained, biologists flagged wetland boundaries. Within portions of the field reconnaissance areas outside of the delineation area, boundaries were estimated and mapped using GPS. All data were incorporated into the project GIS.

Wetlands that extend beyond the field reconnaissance survey area and other potential wetlands outside of the WSDOT or other public rights-of-way that appear to meet the wetland criteria were also incorporated into the GIS database. Ground-truthing and data collection were not possible for these areas because no rights of entry were obtained for properties outside of the field reconnaissance survey area. Potential wetlands were identified by visual observation from public areas during the field reconnaissance; current local, state, and federal wetland maps; and critical area report figures or plans. Boundaries of potential wetlands were added to the project GIS database by incorporating GIS layers prepared by others or estimating and digitizing boundaries over aerial photographs. All wetlands on properties where rights of entry were obtained within 100 feet of the alignment of the Preferred Alternative have been delineated and rated to support permitting with state and local agencies. Some wetlands could not be accessed because right of entry was not granted.

Identified wetlands were classified according to the USFWS *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al. 1979) and *A Hydrogeomorphic Classification for Wetlands* (Brinson 1993). The Washington State Department of Ecology's (Ecology) *Washington State Wetland Rating System for Western Washington – Revised* (Hruby 2004) was used to rate wetlands. Wetlands were also rated according to local regulations. The Cities of Seattle, Mountlake Terrace, and Lynnwood use the Ecology rating system (Seattle Municipal Code 25.09.160A, Mountlake Terrace Municipal Code 16.15.080, and Lynnwood Municipal Code 17.10.050), while the City of Shoreline uses its own rating system (Shoreline Municipal Code 20.80.320). Wetland ratings are used to determine required buffer widths and compensatory mitigation ratios. Generally, the required buffer width and compensatory mitigation ratio increase in conjunction with higher wetland ratings. Functions of delineated wetlands were assessed using the WSDOT *Wetland Functions Characterization Tool for Linear Projects* (Null et al. 2000).

Additional information on methods used for wetland identification, delineation, classification, rating, and buffer width designation is provided in the Wetland and Stream Delineation Report (Appendix B).

Mapping

Each wetland identified in the study area received a unique identifier that was tracked in a GIS database. Wetlands were named based on whether they were field-identified wetlands ("W") or not field-identified/potential wetlands ("PW"), the city they are located in (Seattle = SE, Shoreline = SH, Mountlake Terrace = MT, or Lynnwood = LY), and the order they were encountered in the field (1,2,3, etc.). For example, Wetland WSE5 is the fifth field-identified wetland in Seattle. The field reconnaissance was conducted moving generally from south to north through the study area.

Within the delineation area, biologists flagged wetland boundaries, which professional land surveyors then surveyed. For wetlands identified during the field reconnaissance that are beyond the delineation area, the boundaries were estimated and mapped using GPS. Wetlands that extend beyond the field reconnaissance survey area and other potential wetlands outside of the WSDOT or other public rights-of-way were also incorporated into the GIS database. These included wetlands identified by visual observation from public areas during the field reconnaissance; current local, state, and federal wetland maps; and critical area report figures or plans. These wetland boundaries were added to the project GIS database by adding existing GIS layers or estimating and digitizing boundaries. All wetlands within 100 feet of the Preferred Alternative have been delineated and rated to support permitting with state and local agencies.

Impact Assessment

To evaluate wetland impacts, the project and construction limits were overlain onto ecosystem resource base maps. The project limits include the guideway, station footprints (including parking), roadway improvements, storm drainage ponds, ancillary features, and analytical buffer (Section 1.4.1, Impact Assessment). Impact areas were determined as the area of intersection between the project and construction limits and the wetland and/or buffers. This assessment also considered loss of wetland function (based on the amount of clearing, filling, and/or excavation as a result of the project) and other direct and indirect impacts on wetlands.

3 AFFECTED ENVIRONMENT

3.1 Aquatic Species and Habitat

The Lynnwood Link Extension would be constructed in an urban area where aquatic habitats have already been subjected to a moderate to high degree of alteration. The degree of alteration varies from stream to stream, with the greatest alteration occurring where urban development is the greatest. Some of the smaller streams and headwater reaches have been placed in conveyance systems consisting of pipes and ditches, interfering with natural flow patterns and processes such as groundwater recharge.

3.1.1 Drainage Basin

The study area for the Lynnwood Link Extension is drained by three stream systems: Thornton Creek, McAleer Creek, and Scriber Creek (Figures 3-1a through 3-1c). This map also shows the locations of fish passage barriers within and near the study area, as well as the locations of proposed stream crossings under the light rail alternatives. Salmonid species that are known or expected to occur at locations where project alternatives cross streams are identified in text boxes at those locations on the map. All three streams drain to Lake Washington. These waterways also provide essential fish habitat for federally managed species; such habitat is protected under the Magnuson-Stevens Fishery Conservation and Management Act. Thornton and McAleer creeks drain directly to the lake, while water from Scriber Creek flows to the lake via Swamp Creek and the Sammamish Slough. Lake Washington is the second-largest natural lake in Washington, with a surface area of 22,138 acres. The lake lies at an elevation of 22 feet and has a maximum depth of 214 feet. The major sources of water that enter the lake are the Cedar River (55 percent of the average inflow) and the Sammamish River (27 percent of the average inflow). The remainder of inflow comes from May Creek, Coal Creek, Lyon Creek, McAleer Creek, Thornton Creek, and other smaller streams. The lake drains to Puget Sound through the Lake Washington Ship Canal—an artificial waterway constructed in 1916.

Many species of fish, both native and introduced, inhabit Lake Washington. Discussions in this document focus on salmonids—anadromous[2] salmonids in particular—because these species are a management concern due to habitat degradation and population declines. Salmonids in the Lake Washington watershed are a mix of native and introduced stocks. For example, sockeye salmon (*Oncorhynchus nerka*) that spawn in some areas appear to be descendants of introduced fish, while those in other areas may be native fish (Hendry et al. 1996). Chinook salmon (*O. tshawytscha*) naturally reproduce in many of the watershed streams and are supplemented by hatchery production of fish originally from the Green River (Weitkamp and Ruggerone 2000). Coho salmon (*O. kisutch*) in the watershed also appear to be a mix of naturally produced and hatchery fish (Walter 2013). Chum salmon (*O. keta*) and pink salmon (*O. gorbuscha*) have also been observed. Rainbow trout

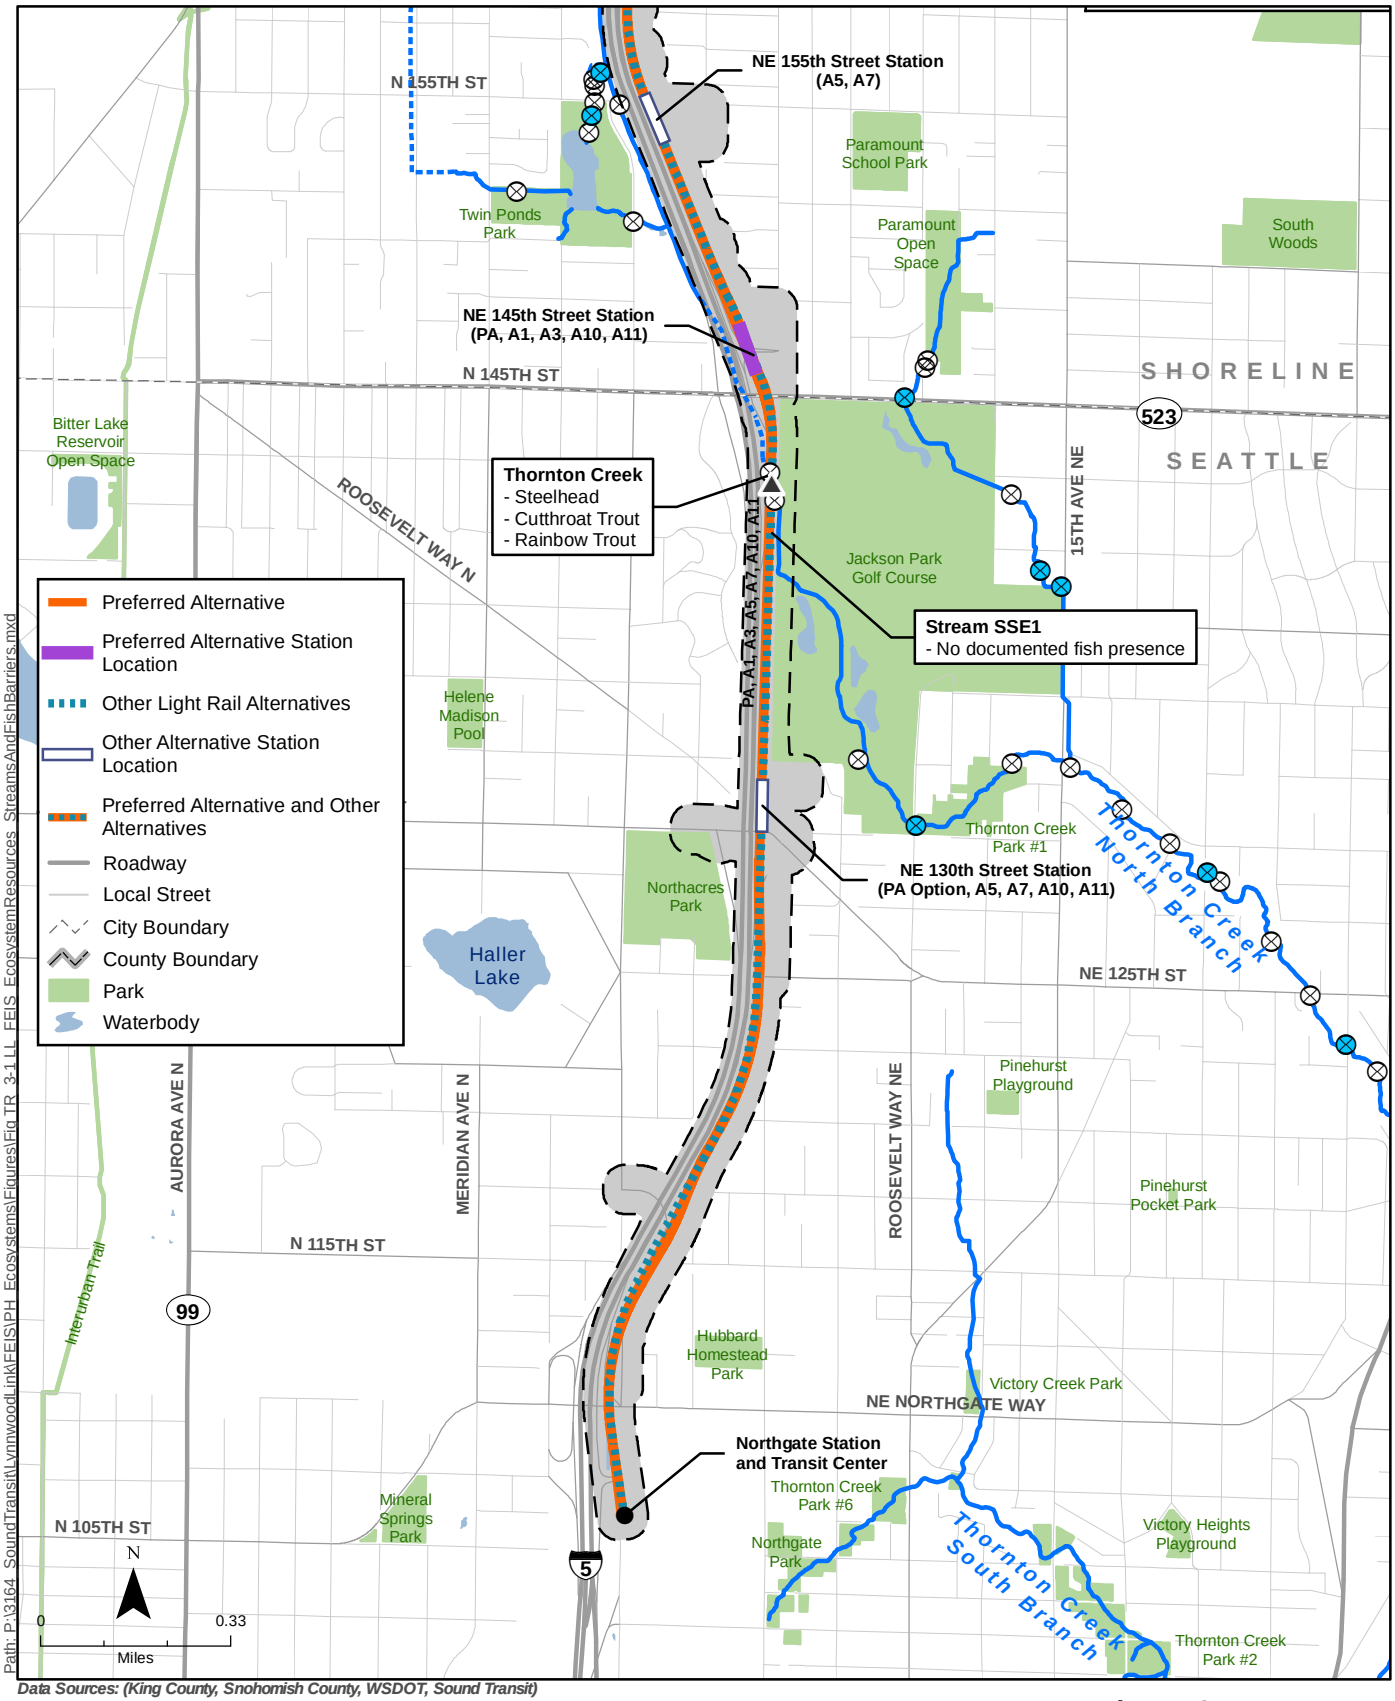
[2] Anadromous fish begin their life in fresh water, migrate to marine waters to reach maturity, and then return to fresh water as adults to spawn.

(*O. mykiss*) and steelhead trout (the anadromous life form of *O. mykiss)* are a mix of introduced hatchery and native stocks. Cutthroat trout (*O. clarkii*), in both resident and anadromous (i.e., sea-run) forms, are also present in the watershed. Kokanee salmon (a form of sockeye that remains in freshwater habitats throughout its life cycle) are also found in the lake and some of its tributary streams. Several species of introduced fish, such as yellow perch (*Perca flavescens*) and smallmouth bass (*Micropterus dolomeiui*), are very abundant. Other introduced species include tench (*Tinca tinca*) and common carp (*Cyprinus carpio*), both native to Europe. The following paragraphs provide additional information about native salmonids.

Adult Chinook salmon in the study area belong to the Sammamish stock (WDFW 2013). Most spawning takes place in North, Swamp, Bear, Little Bear, Thornton, McAleer, Cottage Lake, and Issaquah creeks, as well as in the Sammamish River (WDFW 2012). Run sizes fluctuate considerably; between 2001 and 2012, escapement estimates based on counts of live Chinook in Bear Creek and Cottage Lake Creek ranged between 74 and 531 (WDFW 2013). Spawning in Lake Washington tributary streams generally occurs from mid-September through October (WDFW 2012). Fry emerge from redds during January, February, and March (Celedonia et al. 2008). These juveniles appear to have two rearing strategies: (1) rear in streams until May and then emigrate downstream to lake habitat during May or June; or (2) emigrate shortly after emergence and rear in the lake as fry for 3 to 5 months (Celedonia et al. 2008). Most juvenile Chinook salmon leave Lake Washington and enter Puget Sound in June and July (DeVries et al. 2004).

Steelhead, as well as their resident life form (rainbow trout), are present in the Lake Washington system but are not abundant. Based on chronically low redd counts in Cedar River, Issaquah Creek, and Bear Creek, as well as severe declines in 2000 and 2001, the status of the Lake Washington winter steelhead stock is rated as critical (WDFW 2012). Steelhead spawn in rivers and tributaries throughout the Lake Washington basin, including Thornton Creek and McAleer Creek, generally between mid-December and early June (WDFW 2012). Naturally produced juvenile steelhead either migrate to sea or remain in freshwater as resident rainbow trout (Kerwin 2001). Most juvenile steelhead in the Lake Washington basin remain in streams for 1 to 3 years (Kerwin 2001). Steelhead smolts move into Lake Washington from tributary streams in April on their way out of the system. They stay in the lake for a month or two, migrating out before mid-June (Kerwin 2001). Resident rainbow trout are present in some streams all year long.

Coho salmon in the study area belong to the Lake Washington/Sammamish Tribs stock (WDFW 2012). Based on low escapement values and a long-term negative trend, the stock is rated as depressed (WDFW 2012). Spawning occurs in nearly all tributaries, including Thornton Creek, McAleer Creek, and Scriber Creek, generally from late October to mid-December (WDFW 2012). Fry emerge in late winter and rear in freshwater habitats for 12 to 14 months before migrating through Lake Washington to marine habitats in April and May (Kerwin 2001).



Note:
Text boxes where the project alternatives cross or pass near streams identify the salmonid species known or expected to occur at those specific locations, and are not intended to depict upstream limits of fish distribution.

Streams and
Fish Passage Barriers

Lynnwood Link Extension

Sockeye salmon that use habitats in the study area belong to the Lake Washington/Sammamish Tribs stock (WDFW 2012). The primary spawning areas for this stock are in the Big Bear Creek system and Issaquah Creek (WDFW 2012), but sockeye also use nearly all of the larger tributary streams, including Thornton Creek and McAleer Creek. WDFW (2012) rates the stock as healthy. Between 1991 and 2008, escapement values from Big Bear Creek averaged around 7,400 spawning adults in odd-numbered years and 40,000 adults in even-numbered years (WDFW 2013). Spawning for this stock generally occurs from early September through late December (WDFW 2012). After emerging from spawning gravel in winter and early spring, juvenile sockeye migrate to Lake Washington, where they rear for 1 to 3 years (Kerwin 2001). Juveniles enter the lake as fry during late winter and early spring, and most rear in the lake for 1 year.

Coastal cutthroat trout in both resident and anadromous forms are present in the Lake Washington basin in moderate abundance. Resident fish are present all year long. Sea-run cutthroat spawn over a long period, from winter through May (WDFW 2013). They seek smaller streams with minimal flow and small substrates; cutthroat trout are commonly found in the uppermost reaches of streams, in areas that are too shallow for other salmonids (WDFW 2013). Most sea-run cutthroat rear in stream habitats for 2 to 3 years before migrating to salt water (WDFW 2013).

Bull trout (*Salvelinus confluentus*) have been observed entering Lake Washington through the fish ladder viewing area at the Ballard Locks, where every year, one or two fish are seen traveling into the lake. Many researchers believe that these fish are seasonal transient strays rather than fish produced within the system. Surveys to date have not produced conclusive evidence for the presence or absence of bull trout in the Lake Washington system, outside of a self-sustaining population in the Cedar River drainage above Lower Cedar Falls (King County Department of Natural Resources 2000). For regulatory purposes, USFWS assumes that natural production is possible in the system.

3.1.2 Streams in the Study Area

Discussions in this subsection describe the streams that are present in the study area and provide information about fish use, fish habitat quality, and riparian habitat conditions in the streams and their tributaries. Anthropogenic factors that influence habitat quality for each stream are also identified. Information is organized by the three major stream systems in the study area, progressing from south to north. Table 3-1 summarizes the stream information in the study area. Appendix C includes photographs of the streams.

Thornton Creek

The 7,200-acre Thornton Creek basin drains a substantial portion of northeastern Seattle and most of Shoreline. The stream flows generally south and east before discharging to Lake Washington. Land elevations range from 18 feet at the stream's mouth in Lake Washington to more than 500 feet in the northwestern portions of the basin.

Table 3-1. Summary of Streams in the Lynnwood Link Extension Study Area

Stream Name[a]	Stream Index No.[b]	Fish Habitat Status[c]	Local Jurisdiction	Local Jurisdiction Stream Classification[d]	Local Jurisdiction Buffer Width (feet)
Thornton Creek, North Branch	08.0030	Documented	Seattle	Type 3[e]	75[e]
Thornton Creek Tributary (SSE1)	NA	Potential	Seattle	Type 3[e]	75[e]
McAleer Creek Tributary (SSH2)	NA	Unknown (Presumed Potential)	Shoreline	Piped	10
McAleer Creek Tributary (SSH4)	NA	Unknown	Shoreline	Type III	65
McAleer Creek	08.0049	Documented	Shoreline	Type II	115
McAleer Creek	08.0049	Documented	Mountlake Terrace	Class II	100
McAleer Creek Tributary (SMT1)	08.0050	Potential	Mountlake Terrace	Class III/Class V[f]	65/0[f]
Scriber Creek	08.0061	Documented	Lynnwood	Category I	100
Scriber Creek Tributary (SLY1)	08.0064	Potential	Lynnwood	Category III	35

[a] Streams other than Thornton Creek, McAleer Creek, and Scriber Creek are identified with alphanumeric codes: SYYn. S = stream; YY = two-letter code for local jurisdiction (SE = Seattle, SH = Shoreline, MT = Mountlake Terrace, LY = Lynnwood); n = sequential identification number

[b] Water Resource Inventory Area (WRIA) identification numbers according to Williams et al. (1975). 'NA' indicates watercourses that are not identified in that inventory.

[c] Documented = Fish have been observed in the study area; Potential = Potential fish habitat is present, based on field assessment of stream width and gradient, but stream segments in the study area are upstream of human-caused fish passage barriers; Unknown = No fish presence data are available and stream segments are contained within culverts in the study area.

[d] Identification and classification of streams in this analysis represent conservative estimates, based on available information and the provisions of local critical areas rules. Some of the watercourses identified in this analysis may not actually be defined as streams by the local jurisdictions, or they may be assigned smaller buffers than indicated here. Actual impacts would be analyzed and mitigated as appropriate through local permitting processes.

[e] The Seattle Municipal Code applies development restrictions and specifies mitigation requirements only within environmentally critical areas or buffers on publicly or privately held parcels. The locations where the proposed alignments would pass near Thornton Creek and Stream SSE1 are within the right-of-way for I-5 or other roads and are therefore not subject to City of Seattle buffer requirements. Regulatory buffer widths are used in this analysis to identify areas where construction of the light rail alternatives could affect the condition of riparian buffers. Mitigation requirements would be developed through local permitting processes.

[f] See McAleer Creek discussion below.

Thornton Creek drains the southern half of the study area (south of NE 185th Street, approximately). Segments of the North Branch of Thornton Creek (Water Resources Inventory Area [WRIA] No. 08.0030) within and immediately upstream of the Jackson Park Golf Course fall within the study area. The South Branch of Thornton Creek, also known as Maple Leaf Creek, originates in wetlands near Northgate, North Seattle Community College, and Interstate 5 (I-5) (City of Seattle 2007). The stream drains the southernmost portion of the study area. The two branches join to form the 1.4-mile-long main stream near the Meadowbrook stormwater detention pond in northeast Seattle. The study area does not include any portions of the South Branch or the main stem of Thornton Creek.

The North Branch of Thornton Creek (hereafter referred to as Thornton Creek in this report) originates near Ronald Bog in Shoreline and flows 5 miles before joining the South Branch.

Portions of the stream above and within the study area are as follows, progressing from upstream to downstream:

- After exiting the piped segment immediately south of Ronald Bog, Thornton Creek passes through backyards, roadside ditches, and culverts along and through the I-5 corridor. The stream flows at the surface from approximately North 167th Street through most of the solid waste transfer station, re-enters pipes under the King County Metro bus facility, then flows at the surface most of the way to Twin Ponds (Tetra Tech/KCM 2004a).
- Downstream from Twin Ponds, the creek passes through a small wetland called Peverly Pond and eventually through a concrete-lined channel into a pair of 1,500-foot-long, 72-inch-wide culverts under I-5.
- Downstream of the I-5 culverts, the stream enters the study area, emerging from the I-5 culverts south of North 145th Street and west of 5th Avenue NE, passing through a pair of 48-foot-long, 40-inch-diameter culverts under 5th Avenue NE, and then flowing in a ditch between 5th Avenue NE and the Jackson Park Golf Course for approximately 700 feet before veering east into the golf course (Tetra Tech/KCM 2004a).

Approximately 300 feet south of Thornton Creek's crossing under 5th Avenue NE, a watercourse emerges from a culvert in the I-5 right-of-way, flows southward in the ditch on the west side of 5th Avenue NE, and then drains to Thornton Creek via a culvert under 5th Avenue NE. The watercourse was not catalogued by Williams et al. (1975); the source of the water in the ditch is not known; and historic maps of the area do not indicate the presence of a tributary to Thornton Creek at this location. However, field observations of flowing water during the summer months suggest the possibility that some flow may be derived from groundwater. For this analysis, this watercourse is provisionally identified as a stream (SSE1) and classified as Type 3, based on the presence of a 2-foot-wide channel and a gradient less than 16 percent. A formal determination of whether the watercourse is a stream (and if so, how it is classified) will occur through the process of project permitting with the City of Seattle.

Anthropogenic Factors

Overall, approximately 59 percent of the Thornton Creek basin is covered by impervious surfaces such as roads, buildings, and parking lots (City of Seattle 2007). In portions of the basin north of the Seattle city limits, the City of Shoreline calculated existing impervious area values ranging between 45 and 48 percent (Tetra Tech/KCM 2004a). Kerwin (2001) estimated the effective impervious area in the basin at 31.9 percent. The City of Seattle (2007) identified the following problematic conditions in the system, due primarily to urban development in the basin:

- Altered hydrology, with high and flashy flows
- Degraded water quality, with temperatures and fecal coliform bacteria frequently at levels above state standards
- Excess nutrients under non-storm flow conditions

- Channel incision and degraded in-stream habitat, due to restricted channel width and loss of hydrologic connectivity to the floodplain
- Depressed levels of coarse sediment, in-stream wood, and riparian forest
- Fish passage barriers that limit anadromous fish to 30 percent of the watercourse length
- High pre-spawn mortality rates of coho salmon

Fish Use

The lower reaches of Thornton Creek support spawning anadromous salmonids. Chinook, coho, and sockeye salmon redds have been observed in the North Branch as far upstream as 35th Avenue NE and NE 115th Street, approximately 2.5 miles downstream of the study area (City of Seattle 2007; WDFW 2014a). Individual chum salmon (likely strays from other basins [Kerwin 2001]) have also been sighted in the lower portions of the stream (McMillan 2007 *in* City of Seattle 2007), and steelhead have been observed throughout much of the system (WDFW 2014a).

The City of Seattle (2007) identified at least 4 total barriers and 10 partial barriers to fish passage between the study area and the downstream reaches that support anadromous spawning. However, the observation in 2004 of an adult steelhead trout upstream of Twin Ponds suggests that none of these structures, including the culvert under I-5, may present an absolute barrier to fish passage (Tetra Tech/KCM 2004a). Notably, steelhead are renowned for their ability to negotiate what would be considered barriers for most other salmonids (Tetra Tech/KCM 2004a). Moving upstream from the study area, WDFW (2014c) characterized the culvert under I-5 as a partial barrier to fish passage.

Resident salmonids are also present in the system, including reaches that are within or upstream of the study area. Cutthroat trout have been observed as far upstream as the Jackson Park Golf Course, and rainbow trout have been observed another mile upstream, near Twin Ponds (City of Seattle 2007). According to WDFW (2014b), resident cutthroat trout are expected to be present in Thornton Creek all the way up to Ronald Bog. Native non-salmonid species that use Thornton Creek include threespine stickleback (*Gasterosteus aculeatus*), prickly sculpin (*Cottus asper*), coast-range sculpin (*Cottus aleuticus*), and lamprey (*Lampetra* sp.) (Tabor et al. 2010). Non-native fish species that have been introduced to Thornton Creek, either intentionally or unintentionally, include rock bass (*Ambloplites rupestris*), pumpkinseed (*Lepomis gibbosus*), largemouth bass (*Micropterus salmoides*), and oriental weatherfish (*Misgurnus anguillicaudatus*) (Tabor et al. 2010).

Migratory cutthroat trout are the most abundant salmonid in Thornton Creek, with an average annual adult count of more than 200 live fish on spawning grounds (City of Seattle 2007). Based on carcass counts from 1999 through 2005, the average annual anadromous run size in Thornton Creek is 33 coho, 7 sockeye, and 4 Chinook salmon (City of Seattle 2007). No fish are known or expected to use the watercourse (SSE1) along 5th Avenue NE south of Thornton Creek (WDFW 2014a, 2014b). That watercourse has not been identified as a stream (fish-bearing or otherwise) by WDFW (2014a) or Washington DNR (2014).

Water Quality

No portions of Thornton Creek within the study area are listed as impaired water bodies under CWA Section 303(d) (Ecology 2012a). The main stem and the lower portions of the North and South Branches are listed as impaired, based on demonstrated exceedances of state water quality standards for temperature and dissolved oxygen (Ecology 2012a). The lowest reaches of the main stem are also listed for fecal coliform bacteria. In addition, Ecology (2012a) has identified portions of Thornton Creek as a water of concern for both pH and mercury.

Since 1971, King County has monitored water quality in Thornton Creek at a station located near the stream's mouth. Results from a trend analysis of water quality data from 1971 to 2007 indicated that water quality might have declined during that 37-year analysis period, with statistically significant increases in water temperatures, total phosphorus, turbidity, and conductivity, as well as decreased concentrations dissolved oxygen (King County 2014a). Decreased levels of ortho-phosphorus, nitrate-nitrogen, and total nitrogen indicate some improvements in water quality during that period. In its most recent (2013) water quality report for Thornton Creek, King County assigned the stream a water quality index score of 45, indicating a moderate level of concern for water quality (King County 2014b). In general, scores between 40 and 80 indicate a moderate level of concern and scores below 40 indicate a high level of concern. The water quality index score for Thornton Creek was greater than 40 in only 2 of the 14 years from 2000 to 2013 (King County 2014b).

In-stream Habitat

In-stream habitat quality of Thornton Creek within the study area is rated as low, based on channel morphology, sediment regime, and existing physical habitat conditions (City of Seattle 2007). The stream valley in most of this reach has been modified by grading, fill, and excavation, particularly near I-5, where the stream has been straightened and confined. The channel has more sinuosity within the golf course (downstream of the study area), but the banks in many areas are hardened by riprap and the stream cannot migrate. Note that this description is based on surveys that were completed between 1999 and 2004, before stream restoration work was completed within the Jackson Park Golf Course. The habitat benefits of that effort are not reflected in this description (City of Seattle 2007).

Throughout this segment, the channel is mostly eroding and degrading or has been locked into place through bank armoring. Gradients range between 1 and 2 percent. Gravel and sand are the dominant sediment types, and riffles and glides are the dominant habitat types; little in-stream structure is present to contribute to pool formation. This dearth of in-stream structure also reduces the channel's capacity to trap and store sediment (City of Seattle 2007). Based on the predominance of fine sediments, spawning habitat quality is considered poor. Because of the presence of overhanging vegetation and relatively deep water, portions of the stream within the study area likely provide suitable rearing habitat for juvenile fish (Tetra Tech/KCM 2004a).

Upstream of the I-5 culvert, Thornton Creek runs alongside the western boundary of the study area. The stream is outside of the study area and on the opposite side of I-5 from the proposed

alignments, however, and therefore does not have the potential to be affected by construction of any of the light rail alternatives.

Riparian Habitat

Riparian habitat quality of Thornton Creek within the study area is rated low, based on riparian area width, connectivity, understory and canopy composition, canopy density, and the percentage of the stream shaded by vegetation (City of Seattle 2007). Stream banks in most portions of the study area are dominated by Himalayan blackberry (*Rubus armeniacus*), particularly along the segment that parallels 5th Avenue NE.

On the opposite side of 5th Avenue NE from the alternative light rail alignments, there is a 50- to 70-foot-wide strip of vegetation beside the stream. Vegetation in this strip includes red alder (*Alnus rubra*), black cottonwood (*Populus balsamifera*), and scattered patches of immature western redcedar (*Thuja plicata*). This overstory canopy provides shade for the stream during spring and summer (when the trees have leaves), as well as the potential for contributing some woody debris. Within the golf course, the dominant riparian vegetation in the study area consists of non-native plants, turf, and landscaping.

Riparian habitat for the surface-flowing segment of the watercourse (SSE1) along 5th Avenue NE south of Thornton Creek consists of a strip of red alder and Himalayan blackberry in the I-5 right-of-way between 5th Avenue NE and the off-ramp from I-5 northbound to NE 145th Street.

McAleer Creek

McAleer Creek (WRIA No. 08.0049) originates at Lake Ballinger and flows roughly 6 miles to the northeast corner of Lake Washington. The 5,300-acre drainage basin includes portions of Lynnwood, Edmonds, Mountlake Terrace, Shoreline, and Lake Forest Park. Land elevations range from 18 feet at the stream's mouth in Lake Washington to more than 500 feet north of the Mountlake Terrace Transit Center. Most of the northern portion of the study area (from NE 185th Street in Shoreline, north to about 208th Street SW in Lynnwood) drains to the McAleer Creek system. Areas north of 224th Street SW drain to Lake Ballinger, which empties to McAleer Creek.

Much of McAleer Creek and its tributaries within the study area are contained within culverts. The main stem enters the study area from an open channel through the Nile Golf Course west of I-5. The main stem stream segments in the study area are as follows, progressing from upstream to downstream:

- Culvert under I-5 (440 feet)
- Open channel adjacent to the on-ramp from State Route (SR) 104 westbound to I-5 northbound (240 feet)
- Culvert under the cloverleaf interchange between I-5 northbound and SR 104 westbound (280 feet)
- Open channel in the area enclosed by the cloverleaf off-ramp from I-5 northbound to SR 104 westbound (200 feet)
- 4-foot by 6-foot box culvert under SR 104 (320 feet)

- Channelized open water course in the area enclosed by the cloverleaf on-ramp from SR 104 eastbound to I-5 northbound (200 feet)
- 66-inch-diameter culvert beneath the off-ramp from I-5 northbound to SR 104 (280 feet)

The stream is within the culvert as it exits the study area, briefly resurfacing before entering a 72-inch culvert under Forest Park Drive NE shortly thereafter.

Approximately 1,800 feet south of the I-5/SR 104 interchange, a tributary to McAleer Creek (Stream SSH2) has been identified as passing under I-5 (Tetra Tech/KCM 2004b). This tributary was not catalogued by Williams et al. (1975). After entering a culvert just west of I-5, the stream remains piped for approximately 1,500 feet, resurfacing shortly before its confluence with the main stem near a wastewater pumping station upstream of 15th Avenue NE (Tetra Tech/KCM 2004b). The open-water portions of the stream within the study area, west of I-5, are within concrete-lined ditches along NE 200th Street. During site visits conducted for this analysis, flowing water was observed in this watercourse only during and immediately after rainfall.

Within the cloverleaf interchange between eastbound SR 104 and northbound I-5, a watercourse emerges from a culvert under the roadway, flows approximately 30 feet, and then joins McAleer Creek. The watercourse was not catalogued as a stream by Williams et al. (1975), the source of the water is not known, and historical maps of the area do not indicate the presence of a tributary to McAleer Creek at this location. However, field observations of flowing water during the summer months suggest the possibility that some flow may be derived from groundwater. For this analysis, this watercourse is provisionally identified as a stream (SSH4) and classified as Type III, based on the presence of a 2-foot-wide channel and a gradient less than 16 percent. A formal determination of whether the watercourse is a stream (and if so, how it is classified) will occur through the process of project permitting with the City of Shoreline. If the watercourse is classified as a Type III stream, its regulatory buffer will be contained entirely within the larger regulatory buffer for McAleer Creek. Riparian habitat conditions for Stream SSH4 are therefore as described for McAleer Creek, above.

North of the I-5/SR 104 interchange, a tributary (WRIA No. 08.0050; Stream SMT1) joins McAleer Creek in the wooded area adjacent to the on-ramp from SR 104 westbound to I-5 northbound. The tributary originates in Veterans Memorial Park northeast of the Mountlake Terrace Transit Center, then flows south through a series of open watercourses and culverts east of I-5. During site visits conducted for this analysis, flowing water was observed in this watercourse only during and immediately after rainfall. Farther downstream, along the eastern border of the Edmonds School District property south of 236th Street SW, water from a culvert under the school property contributes flow on a more regular basis. The City of Mountlake Terrace has identified the uppermost reaches of this watercourse in the study area as a Class V (seasonal, non-fish-bearing) stream that does not require a regulatory buffer. It is possible that the City may determine that the downstream reaches meet the criteria for a Class IV (requiring a 50-foot buffer) or Class III stream (requiring a 65-foot buffer). The segment that is crossed by the proposed light rail alignments is upstream of the water source in the Edmonds School District property and is therefore likely to be considered a Class V stream.

Anthropogenic Factors

In addition to the extensive portions of the stream that are contained within culverts, McAleer Creek has been affected by urban development throughout its basin. Kerwin (2001) estimated the effective impervious area in the basin at 30.5 percent. Tetra Tech/KCM (2004b) calculated the total impervious area for portions of the McAleer Creek basin within the city of Shoreline to be 46 percent. Forested areas provide shade and other vital functions in some areas; in most of the basin, however, riparian habitat includes single-family homes, apartments, and lawns.

Fish Use

McAleer Creek supports anadromous fish as far upstream as Lake Ballinger. Within the study area, portions of McAleer Creek downstream of the confluence with Stream SMT1 provide spawning habitat for coho salmon, while those upstream of that point provide rearing habitat (WDFW 2014a). WDFW (2014a) has documented the presence of steelhead as far upstream as the mouth of Stream SMT1. Tetra Tech/KCM (2004b) reported observations of steelhead spawning in McAleer Creek approximately 200 feet downstream of the study area, although WDFW (2014a) does not identify any parts of McAleer Creek as spawning habitat for steelhead. Resident cutthroat trout are present throughout the stream, even upstream of Lake Ballinger (WDFW 2014b), and have been observed spawning in McAleer Creek immediately outside of the study area (Tetra Tech/KCM 2004b).

The presence of Chinook salmon has been documented approximately 1,000 feet downstream of the study area, and spawning has been documented approximately 4,800 feet farther downstream (Tetra Tech/KCM 2004b; WDFW 2014a). King County (2014a) reported that volunteers with the Salmon Watcher Program have consistently seen Chinook, coho, and sockeye salmon in the stream but did not specify the upstream extent of observations or whether any spawning activity was observed. Kokanee salmon and rainbow trout have also been observed in McAleer Creek, but locations for those observations have not been specified (Kerwin 2001).

WDFW (2014c) classified four culverts in McAleer Creek downstream of the study area as partial barriers to fish passage, and one culvert as a possible barrier. Within the study area, the culverts under I-5 and under the off-ramp from I-5 northbound to SR 104 westbound are also partial barriers (WDFW 2014c). The culvert under I-5 may be a migration barrier to juvenile salmonids, thus preventing the use of Lake Ballinger for rearing (Kerwin 2001; WDFW 2014c).

Based on intermittent flows and the presence of human-created barriers to fish passage, neither SSH2 nor SMT1 is known or expected to support fish under current conditions (WDFW 2014a, 2014b). However, the basin sizes, channel widths, and stream gradients of both tributaries indicate the potential to support fish in the future. The surface-flowing segment of SSH4 is connected to McAleer Creek and is accessible to fish that use habitats in McAleer Creek in the study area.

Water Quality

No portions of McAleer Creek within the study area are listed as impaired or waters of concern under CWA Section 303(d). The lower portions of McAleer Creek are listed as impaired water bodies, based on demonstrated exceedances of state water quality standards for fecal coliform and dissolved

oxygen (Ecology 2012a). Lake Ballinger, upstream of the study area, is on the list for contaminants, including polychlorinated biphenyls (PCBs), dieldrin, and 2,3,7,8-TCDD in tissue samples (Ecology 2012a).

Sediment samples collected at a site approximately 1 mile upstream of the study area had chemical compounds at concentrations likely to cause adverse effects in aquatic animals living in the sediments (King County 2014a). Sediment samples from a site approximately 0.25 mile downstream of the study area contained pyrene and nickel, but the potential for chemical effects is uncertain due to the contaminant levels (King County 2014a).

Since 1976, King County has monitored water quality in McAleer Creek at a station located near the stream's mouth. Results from a trend analysis of water quality data from 1979 to 2004 did not indicate any significant changes in temperature, concentration of dissolved oxygen, or levels of bacteria, nitrogen, and total phosphorus (King County 2014a). However, conductivity increased significantly during the analysis period, suggesting the presence of dissolved charged substances in the water, possibly related to metal concentrations in sediments (King County 2014a). Decreasing levels of total suspended solids and decreased concentrations of ortho-phosphorus indicate some improvements in water quality during that 25-year period. In its most recent (2008) water quality report for McAleer Creek, King County assigned the stream a water quality index score of 74, indicating a moderate level of concern for water quality (King County 2014c). In general, scores between 40 and 80 indicate a moderate level of concern and scores above 80 indicate a low level of concern. Water quality index scores for McAleer Creek generally ranged between 50 and 60 from 2000 to 2008, dropping below 40 in 2 years (King County 2014c).

In-stream Habitat

Immediately downstream of the study area, the in-stream habitat of McAleer Creek has been rated as poor, based on the preponderance of fine sediments, as well as scouring and incision resulting from bank hardening (Tetra Tech/KCM 2004b). The channel provides poorly defined pool-riffle complexes; the only pool habitat consists of step-pools formed by weirs. The gravel/cobble stream substrate is heavily cemented with sediment, reducing its spawning suitability (Tetra Tech/KCM 2004b). Based on benthic invertebrate samples collected in 2002 and 2003, King County (2014a) rated conditions in McAleer Creek as poor for benthic invertebrates.

The tributary (Stream SSH2) that passes under I-5 south of SR 104 is entirely within culverts in the study area. In addition, the tributary originating in Veterans Memorial Park (Stream SMT1) is partially piped in the study area. The quality of habitat in portions of the stream that are not contained in culverts is generally low. The reach of Stream SMT1 that is crossed by the proposed light rail alignments is contained within an ill-defined channel that shows minimal traces of surface flow. As noted above, however, the basin sizes, channel widths, and stream gradients of both tributaries indicate the potential to support fish in the future.

Riparian Habitat

Riparian habitat quality along the open-channel segments of McAleer Creek, Stream SSH4, and Stream SMT1 in the study area is generally good, dominated by forest canopy that provides shade and the potential for recruitment of woody debris that contributes to channel complexity. The value of the riparian habitat is limited, however, by a lack of connectivity. The open-channel habitat and associated riparian areas of McAleer Creek occur in four discrete segments in the study area, separated by segments that are contained within culverts. If Stream SSH4 is classified as a Type III stream by the City of Shoreline, its regulatory buffer will be contained entirely within the larger regulatory buffer for McAleer Creek. Riparian habitat conditions for Stream SSH4 are therefore as described for McAleer Creek.

Scriber Creek

Scriber Creek (WRIA No. 08.0061) drains an area of approximately 4,250 acres, including the extreme northern portion of the study area. Land elevations range from approximately 200 feet at the stream's confluence with Swamp Creek to more than 600 feet at the northwestern watershed divide. The stream flows southeast, joining Swamp Creek approximately 2.5 miles downstream of the study area. Swamp Creek flows into the Sammamish River, which empties into the northern end of Lake Washington.

The study area includes approximately 2,000 feet of the main stem of Scriber Creek. For much of its length in the study area, the stream channel is braided and indistinct as it flows through the large wetland complex (Wetland WLY4) south and west of the Lynnwood Transit Center. The stream forms a defined channel as it exits the study area, flowing southeast and under I-5. Based on input provided by Ecology staff who collaborated on field delineations in July 2014, the OHWM of Scriber Creek through the wetland complex is defined as encompassing the entire breadth of the complex. At most times of year, flowing water is confined to a few channels that make up a small portion of the total wetland complex area. The locations of these channels likely change from year to year.

Also present in the study area is an unnamed, intermittent tributary (WRIA No. 08.0064; Stream SLY1) that flows southward along the eastern edge of the Lynnwood Transit Center. The channel flows through a small patch of forest vegetation (the upper part has been recently planted) before it enters a culvert under the I-5 on-ramp and joins Scriber Creek southeast of I-5.

Anthropogenic Factors

Scriber Creek subbasin is the most highly developed of the Swamp Creek subbasins. Commercial development and transportation corridors account for approximately 40 percent of the subbasin, and medium-density single-family development covers another approximately 30 percent (Snohomish County 2002). The effective impervious area in the subbasin is approximately 40 percent (Snohomish County 2002). Jones and Stokes (2000) identified untreated runoff from roads and new construction as a likely source of excessive fine sediment in the portion of Scriber

Creek that falls within the study area. Street runoff from roads upstream of the study area also conveys oil and other pollutants to the stream system.

Fish Use

Anadromous salmonids have been observed in Scriber Creek, but sources differ about their habitat use as far upstream as the study area. WDFW (2014a) reported that coho salmon occur in Scriber Creek approximately 500 feet downstream of the study area, below the culvert under I-5. Access by other salmonid species to reaches of Scriber Creek in the study area is impeded by the I-5 culvert (which is characterized as a partial barrier to fish passage) and by a beaver dam approximately 0.5 mile downstream of the study area. WDFW (2014c) classifies the dam as a total barrier to fish passage but also indicates that coho salmon have been observed approximately 2,000 feet upstream of the dam, at the outlet of the I-5 culvert. The picture is further complicated by reports from the City of Lynnwood (2004) of adult coho salmon in Scriber Creek as far upstream as Highway 99, approximately 1 mile above the study area.

Stream reaches approximately 1,500 feet downstream of the study area provide spawning habitat for coho salmon (WDFW 2014a). Chinook salmon have been observed approximately 3,000 feet downstream of the study area; the nearest stream reaches that provide spawning habitat for Chinook salmon are in Swamp Creek, approximately 2.5 miles downstream. Winter-run steelhead have been observed in Swamp Creek but not in Scriber Creek (Snohomish County 2002; WDFW 2014a). There are no reports of kokanee above the mouth of Swamp Creek and no recent validated reports of bull trout in the Swamp Creek subbasins (Snohomish County 2002).

Resident fish species in Scriber Creek include cutthroat trout, which have been documented throughout the study area, as far upstream as Scriber Lake Park (WDFW 2014b). Largemouth bass and yellow perch have been observed in Scriber Lake upstream of the study area (Jones and Stokes 2000).

The tributary east of the Lynnwood Transit Center (Stream SLY1) is non-fish-bearing (Snohomish County 2002; WDFW 2014a, 2014b).

Water Quality

Scriber Creek is not on the 303(d) list of impaired waters in the State of Washington. Possible water quality problems may be indicated, however, by evidence of hydrocarbon pollution (oily sheen and odor) and the abundance of pollutant-tolerant stream invertebrates (Jones and Stokes 2000). Stream temperatures measured in the study area fall within the acceptable range for salmonid fish use, but the lack of shade-producing vegetation increases the risk of elevated temperatures (Jones and Stokes 2000).

In-stream Habitat

The main stem reach in the study area is dominated by the large scrub/shrub wetland adjacent to the park-and-ride lot. Salmon spawning habitat conditions within this reach are poor due to limited canopy and vegetative cover, the presence of bank armoring, and the abundance of silt and other fine

substrates (Jones and Stokes 2000). Side channels and other low-velocity areas may provide good rearing habitat, however (City of Lynnwood 2004).

The tributary east of the Lynnwood Transit Center (Stream SLY1) is highly channelized and does not flow at the surface for most of its length. The surface-flowing sections are the short segments within and downstream of the study area, and a segment on the Lynnwood Civic Center campus approximately 0.6 mile north of the study area. The primary source of flow in the tributary is urban runoff, and habitat quality is generally poor. Stormwater runoff from impervious surfaces likely contributes to a flashy flow regime (i.e., peaking abruptly and falling off rapidly after rain events) during fall and winter (City of Lynnwood 2004).

The portion of Stream SLY1 in the study area is separated from known fish-bearing waters by culverts under the off-ramp from I-5 northbound to 44th Avenue W, I-5 itself, and the on-ramp from 44th Avenue W to I-5 southbound. WDFW (2014c) has not evaluated the fish passage potential of these culverts because Stream SLY1 is considered a non-fish-bearing stream. Based on the presence of human-created barriers to fish passage, Stream SLY1 is not currently known or expected to support fish. Based on its basin size, channel width, and stream gradient, however, Stream SLY1 may have the potential to support fish in the future.

Riparian Habitat

Riparian vegetation for Scriber Creek in the study area generally consists of the surrounding wetland complex (Wetland WLY4). Vegetation in Wetland WLY4 is dominated by black cottonwood, Pacific willow (*Salix lucida*), red-osier dogwood (*Cornus sericea*), and reed canarygrass (*Phalaris arundinacea*). Areas with dense growth of salmonberry (*Rubus spectabilis*) and Himalayan blackberry are also present, along with red alder, western redcedar, bigleaf maple (*Acer macrophyllum*), and Pacific flowering dogwood (*Cornus nuttallii*). Jones and Stokes (2000) found little to no large woody debris in the stream and determined that the potential for large woody debris recruitment is low.

3.1.3 Threatened, Endangered, and Candidate Species

Four aquatic species that have federal or state listing status, or that are candidates for listing, may use habitats in the study area. In accord with the ESA, the FTA (as the federal lead agency) must ensure that any actions it approves will not jeopardize the continued existence of endangered or threatened species or result in the destruction or adverse modification of their designated critical habitat. To meet this requirement, FTA initiated consultation with USFWS and NOAA Fisheries concerning the potential effects of the Preferred Alternative on ESA-listed species and critical habitat. Sound Transit prepared a Biological Assessment to serve as the basis for the consultation (Sound Transit 2014). Based on the analysis in that document, and on the implementation of proposed mitigation measures, FTA determined that construction of the Lynnwood Link Extension may affect, but is not likely to adversely affect, ESA-listed species and critical habitat. The Biological Assessment also included a proposed determination of "no adverse effect" on essential fish habitat protected under the Magnuson-Stevens Fishery Conservation and Management Act. NOAA Fisheries concurred with these determinations on January 27, 2015, and USFWS concurred on ___, 2015. The

discussions below summarize information from that document about the presence of ESA-listed species in the study area.

Puget Sound Chinook Salmon

The Puget Sound evolutionarily significant unit of Chinook salmon is listed as threatened under the ESA and is a State Candidate species. Chinook salmon are present in the lower reaches of Thornton, McAleer, and Scriber creeks. In all three streams, the reaches where Chinook salmon have been observed are separated from the study area by total or partial fish passage barriers. It is possible, however, that Chinook salmon may use habitat in McAleer Creek within the study area. The known distribution of Puget Sound Chinook salmon in the project vicinity is as follows:

- Thornton Creek: Chinook salmon have been documented approximately 2.5 miles downstream of the study area and observed spawning approximately 3 miles downstream of the study area (City of Seattle 2007; WDFW 2014a); there are at least 3 total barriers and 15 partial barriers to fish passage between the study area and the downstream reaches where the presence of Chinook salmon has been documented (WDFW 2014c).
- McAleer Creek: Chinook salmon are present up to 1,000 feet downstream of the study area, and spawning habitat is present approximately 1.1 miles downstream (WDFW 2014a). Partial barriers to fish passage at I-5 (within the study area) and Forest Park Drive NE (immediately downstream of the study area) likely impede access into the study area by Chinook salmon, but they cannot be considered absolute barriers.
- Scriber Creek: Chinook salmon are present up to 3,000 feet downstream of the study area, and spawning habitat is present in in Swamp Creek, approximately 2.5 miles downstream (WDFW 2014a). A total barrier to anadromous fish passage approximately 0.5 mile downstream of the study area likely prevents Chinook access to the study area.

Based on the lack of suitable habitat and the presence of fish passage barriers downstream of the study area, Chinook salmon are not expected to use habitat in Thornton Creek or Scriber Creek in the study area. Although habitat conditions in McAleer Creek are unfavorable for Chinook salmon, and none have been documented in the study area, their presence in the lower reaches of the stream suggests the possibility that Chinook salmon could use McAleer Creek in the study area (Sound Transit 2014). None of the tributaries to Thornton, McAleer, and Scriber creeks in the study area are known or expected to support use by any fish species, including Chinook salmon. No designated critical habitat for Chinook salmon is present in the study area.

Puget Sound Steelhead

The Puget Sound evolutionarily significant unit of steelhead trout is listed as threatened under the ESA, but has no listing status at the state level. Winter-run steelhead trout are present in Thornton and McAleer creeks, but they have not been observed in Scriber Creek. Compared to other salmonids, steelhead appear to have a greater ability to pass features and structures that are partial fish passage barriers. Therefore, steelhead have a greater likelihood than Chinook salmon of using

stream habitat in the study area. The known distribution of Puget Sound steelhead in the project vicinity is as follows:

- Thornton Creek: Steelhead are present in the North Branch of Thornton Creek as far upstream as the Jackson Park Golf Course, approximately 2,100 feet downstream of the study area (WDFW 2014a). Based on the observation of an adult steelhead near Twin Ponds upstream of the study area (Tetra Tech/KCM 2004a), however, it is possible that steelhead may use stream habitats in the study area.
- McAleer Creek: Steelhead are present in McAleer Creek as far upstream as the mouth of the Stream SMT1 (WDFW 2014a). Tetra Tech/KCM (2004b) reported observations of steelhead spawning in McAleer Creek approximately 200 feet downstream of the study area, below a partial barrier to fish passage
- Scriber Creek: Present in Swamp Creek (approximately 2.5 miles downstream of the study area) but not in Scriber Creek (Snohomish County 2002; WDFW 2014a). A total barrier to anadromous fish passage approximately 0.5 mile downstream of the study area likely prevents access to the study area (WDFW 2014c).

Based on this information, adult steelhead spawning in downstream reaches of Thornton Creek and McAleer Creek may venture upstream into the study area in both streams. No other stream reaches in the study area are accessible to steelhead. Designation of critical habitat for steelhead has been proposed, but no proposed critical habitat is present in the study area.

Bull Trout

All bull trout in the coterminous United States, including the Coastal-Puget Sound distinct population segment, are listed as threatened under the ESA. Bull trout is also a State Candidate species. Bull trout have been observed entering Lake Washington in small numbers. None of the streams in the study area has been documented as supporting spawning or early rearing. Water temperatures in the study area streams are likely too high to support bull trout spawning or rearing. WDFW (1999) determined that successful spawning by bull trout occurs only upstream of the winter snow line (i.e., the elevation at which snow is present on the ground for much of the winter). Such areas are not found in the Thornton Creek, McAleer Creek, and Scriber Creek basins but may be present in other tributaries to Lake Washington. No designated critical habitat for bull trout is present in the study area.

River Lamprey

The river lamprey (*Lampetra ayresii*) has no listing status at the federal level but is a State Candidate species. Although there are no direct observations of river lamprey in the study area, their presence is likely. They are known to exist in tributaries to Lake Washington and Lake Sammamish, such as the Cedar River and Issaquah Creek.

3.1.4 Tribal Fishing

Judicial decisions have affirmed that federally recognized tribes have treaty rights which include, but are not limited to, the rights to harvest fish free of state interference (subject to conservation principles) and to co-manage the fishery resource. Lake Washington is among the usual and accustomed fishing areas of the federally recognized Muckleshoot Indian Tribe. Project impacts to Lake Washington's tributaries could affect the productivity of tribal fisheries, and thereby harm the fishing interests of the Muckleshoot and other tribes. Sound Transit is therefore addressing potential effects on fish and fish habitat in this report and coordinating with the Muckleshoot Indian Tribe Fisheries Division regarding these potential effects.

3.2 Vegetation, Terrestrial Wildlife, and Wildlife Habitat

The Lynnwood Link Extension would be constructed in an urban area where terrestrial habitats have already been subjected to a moderate to high degree of alteration. The degree of alteration varies from site to site, with the greatest alteration occurring where urban development is the greatest. Most of the study area is within or immediately adjacent to the I-5 corridor and, as such, has been substantially modified from pre-settlement conditions. Some areas of less-developed habitat remain, however, most notably near the Mountlake Terrace Transit Center and in the Scriber Creek wetland complex near the northern extreme of the study area.

3.2.1 Land Cover Types

Based on the structural categories defined by Johnson and O'Neil (2001) and on observations during field reconnaissance, six land cover types have been identified in the study area: Forest, Shrub, Maintained Vegetation, Residential Areas, Urban Areas, and Open Water. Table 3-2 provides brief descriptions of these cover types, with examples of where they occur in the study area. Figure 3-2a through Figure 3-2c show the mapped locations of the cover types within the study area.

Most of the study area is dominated by land cover types (Urban Areas, Residential Areas, Maintained Vegetation) where reduced structural complexity and high levels of human activity result in low habitat quality for wildlife. More than 70 percent of the study area consists of the Urban and Residential Areas cover types, which cover approximately 476 acres combined (Table 3-2). Forest is the next most common cover type (13 percent of the study area), with 88 acres. Shrub and Maintained Vegetation cover roughly equivalent amounts of area, with 58 and 61 acres, respectively. Less than 0.5 acre of the study area consists of the Open Water cover type.

The area of Forest habitat east of I-5 near the Mountlake Terrace Transit Center has been identified by WDFW (2014b) as a priority habitat area based on the presence of high-quality habitat features. In addition, the study area includes a portion of Northacres Park in Seattle. Stands of coniferous and deciduous trees in that park have been identified as priority habitats, as these stands have snags and downed logs (WDFW 2014b).

Lynnwood Link Extension

3.2.2 Terrestrial Wildlife Species

Wildlife use of habitats in urban landscapes depends on the general location of the habitat, the size and type of undisturbed habitats, the degree of connectivity and extent of travel corridors between and among these habitats, and the types and levels of human activity. Much of the Lynnwood Link Extension study area falls within commercial, industrial, and residential areas that provide habitat only for adaptable species such as sparrows, starlings, doves, rats, mice, raccoons, opossums, and squirrels. Birds such as common pigeons (*Columba livia*) and cliff swallows (*Petrochelidon pyrrhonota*) commonly build nests on bridges and road overpasses, and many bat species use such structures as temporary roosting sites. Animals that use habitats in the study area are also exposed to high noise levels associated with traffic on I-5 and major arterial roadways.

Table 3-2. Land Cover Types in the Lynnwood Link Extension Study Area

Land Cover Type	Description	Examples of Occurrence	Acres in Study Area
Forest	Areas dominated by evergreen conifers, deciduous broadleaf trees, or a mixture of both, generally greater than 20 feet tall. Canopy cover variable but typically greater than 40 percent. Typical tree species include Douglas fir (*Pseudotsuga menziesii*), western hemlock (*Tsuga heterophylla*), madrone (*Arbutus menziesii*), red alder, black cottonwood, and bigleaf maple. Understories include shrubs, forbs, and/or grasses.	Northacres Park Veterans Memorial Park Scriber Creek wetland complex	89
Shrub	Areas dominated by native or non-native shrubs. May include trees (particularly red alder) singly or in patches. Common shrub species within the study area include salmonberry, salal (*Gaultheria shallon*), Himalayan blackberry, and snowberry (*Symphoricarpos albus*).	Slopes adjacent to I-5 Scriber Creek wetland complex	59
Maintained Vegetation	Typically, exotic grasses or annuals, such as mown grasses and other low vegetation, most of which are rarely allowed to go to seed. Includes stormwater detention areas.	I-5 median	62
Residential Areas	Houses and yards, including lawns, ornamental plantings, and pruned trees. Tree and shrub canopy cover generally less than 30 percent. Moderate to high levels of human disturbance. Snags, woody debris, and other natural structures are essentially non-existent.	South Lynnwood Pinehurst	171
Urban Areas	Roadways, parking lots, and other areas dominated by impervious surfaces. Little or no vegetation present.	I-5, parking lots, commercial developments	309
Open Water	Areas of ponding, including natural lakes, streams, and stormwater ponds. All open water in the study area is fresh water.	Ponds near Scriber Creek	<1

Larger habitat patches and those connected to other natural areas or heavily vegetated residential neighborhoods support a larger variety of species, such as songbirds, raptors, small mammals, coyotes, and black-tailed deer (*Odocoileus hemionus columbianus*). Songbird species commonly found in habitats similar to those found in the study area include American robin (*Turdus migratorius*), song sparrow (*Melospiza melodia*), Steller's jay (*Cyanocitta stelleri*), American crow (*Corvus brachyrhynchos*), spotted towhee (*Pipilo maculates*), black-capped chickadee (*Poecile atricapillus*), white-crowned sparrow (*Zonotrichia leucophrys*), northern flicker (*Colaptes auratus*), Bewick's wren (*Thryomanes bewickii*), and red-

breasted nuthatches (*Sitta canadensis*). Raptors include American kestrel (*Falco sparverius*), sharp-shinned hawk (*Accipiter striatus*), Cooper's hawk (*A. cooperii*), red-tailed hawk (*Buteo jamaicensis*), and great horned owl (*Bubo virginianus*). Red-tailed hawks and other raptors prey on voles (*Microtus* spp.) that are found in abundance in the grassy vegetation in the I-5 right-of-way.

The largest area of native habitat in the study area is the Scriber Creek wetland complex. Waterfowl use areas of slow-moving water, and snags throughout the complex show evidence of recent excavation by woodpeckers. Biologists conducting field visits in 2014 observed an osprey nest on a power pole near the southern edge of the wetland complex. Vegetation and other features in the complex provide habitat for songbirds, small mammals, and amphibians. Mammals identified in nearby Scriber Creek Park included black-tailed deer, Eastern gray squirrel (*Scirurus carolinensis*), and river otter (*Lontra canadensis*). Evidence of beavers (*Castor canadensis*), including dams and lodges, has been observed nearby. The complex is surrounded on all sides, however, by residential and commercial developments, roads, and highways, limiting its value for wildlife species that require large, undisturbed areas and undeveloped travel corridors. The presence of invasive plant species, including Himalayan blackberry and reed canarygrass (*Phalaris arundinacea*), diminishes the value of habitats in the wetland complex.

Most patches of forest cover in the study area are fragmented and separated from surrounding habitat areas by commercial, urban, and residential developments and roads. Despite their isolation, these areas still provide habitat for forest-associated resident and migratory songbirds, as well as for hawks, owls, woodpeckers, and small mammals.

Based on breeding bird survey reports (Opperman et al. 2006), 26 bird species are known or expected to nest in the 9-square-mile survey block located near the southern terminus of the project (Northgate). Based on data from the Audubon Society (2011), additional species commonly seen in the area outside of the breeding season include American wigeon (*Anas americana*), northern pintail (*Anas acuta*), bufflehead (*Bucephala albeola*), western grebe (*Aechmophorus occidentalis*), and glaucous-winged gull (*Larus glaucescens*).

Rivers and streams are used as travel corridors by many wildlife species, including semi-aquatic species such as muskrat, mink, otter, frogs, stream salamanders, turtles, and snakes (Jackson 2003). Despite the widespread urbanization of the I-5 corridor, riparian areas along the streams may serve as a connective corridor between pockets of wildlife habitat. In general, however, patches of forest and other native habitat types in the study area are isolated from other areas of similar habitat and do not serve as connective corridors to other areas of habitat outside of the study area.

3.2.3 Threatened, Endangered, and Candidate Species

Based on reviews of Natural Heritage Program data from DNR and PHS data from WDFW, no terrestrial ESA-listed or state-listed threatened or endangered plant or wildlife species are known or expected to occur in the study area. The USFWS species lists for King County and Snohomish County identify five ESA-listed wildlife species (Canada lynx [*Lynx canadensis*], gray wolf [*Canis lupus*], grizzly bear [*Ursus arctos horribilis*], marbled murrelet [*Brachyramphus marmoratus*], and northern spotted owl [*Strix occidentalis caurina*]), two species that are proposed for listing (North American wolverine

[*Gulo gulo luscus*] and Oregon spotted frog [*Rana pretiosa*]), and two candidates for listing (Pacific fisher [*Martes pennanti pacifica*] and yellow-billed cuckoo [*Coccycus americanus*]) that may occur in the two counties (USFWS 2014). Based on their habitat requirements and known distribution, none of these species is known or expected to use habitats in the study area. These species will not be addressed further in this document.

Several species that are state-listed as sensitive species, or that are candidates for state listing, are known or likely to be present in the study (Table 3-3). For this analysis, these species are referred to as species of concern. Site-specific distribution data are available for only a few of these species, and no species-specific surveys or habitat assessments were conducted for this project. The known or expected occurrence of these species in the study area is based on observations and the presence of potentially suitable habitat (Table 3-3).

The Migratory Bird Treaty Act, administered by USFWS, makes it unlawful to take, import, export, possess, sell, purchase, or barter any migratory bird, with the exception of the taking of game birds during established hunting seasons. The law also applies to feathers, eggs, nests, and products made from migratory birds. Nearly all bird species that may occur in the study area are protected under the Migratory Bird Treaty Act. All habitats in the study area support migratory birds of some type at some time in their life cycle; therefore, all habitats identified above would be considered habitat for migratory birds.

Table 3-3. Species of Concern That May Occur in the Lynnwood Link Extension Study Area

Common Name	Scientific Name	Federal Status[a]	State Status[b]	Expected Occurrence in Study Area		Preferred Habitat
				Likely Present	Possibly Present	
Townsend's Big-eared Bat	*Corynorhinus townsendii*	FCo	SC		X	Forages over and near forested habitat; bridge abutments occasionally used by individual male bats as day roosts.
Western Toad	*Anaxyrus boreas*	FCo	SC	X		Breeds and develops in wetland habitats. Adult toads regularly use forested upland habitat.
Bald Eagle	*Haliaeetus leucocephalus*	FCo	SS		X	Nests in wooded areas with larger trees within 0.5 mile of large bodies of water. May forage near the study area.
Peregrine Falcon	*Falco peregrinus*	FCo	SS		X	Typically nests in cliffs that are at least 150 feet high; may also use buildings and bridges. Open habitats, including wetland areas, provide foraging habitat.
Pileated Woodpecker	*Dryocopus pileatus*	None	SC	X		Mature and old-growth forests, second-growth forests with large snags and fallen trees. Evidence of recent excavations observed in Nile Golf Course, near study area.
Vaux's Swift	*Chaetura vauxi*	None	SC		X	Breeds in mountains and foothills. Forages over wooded areas and open habitats, including towns.

[a] FCo = Federal species of concern

[b] SC = State Candidate; SS = State Sensitive species

3.3 Wetlands

Sound Transit identified 37 wetlands in the study area. On public rights-of-way and parcels where rights of entry were available, wetlands within 100 feet of the footprint of the Preferred Alternative were formally delineated and rated according to local regulations and the *Washington State Wetland Rating System for Western Washington*. Other wetlands, including those within public rights-of-way near any of the light rail alternatives, were mapped and rated as well. Table 3-4 summarizes classification and rating information for the delineated and other field-identified wetlands in the study area.

Detailed wetland descriptions, wetland determination data forms, wetland rating forms, and photographs are provided in the Wetland and Stream Delineation Report (Appendix B). Figure 3-1 in Appendix B presents an overview of mapped locations of field-identified and potential wetlands within the study area. Potential wetlands include portions of field-identified wetlands that extend beyond the field reconnaissance survey area, as well as areas that appear to meet the wetland criteria that fall entirely outside of this survey area, but could not be ground-truthed. Appendix D presents detailed locations of individual wetlands and buffers. One of the field-identified wetlands (Wetland WSH1) contains a ditched swale. Of the field-identified wetlands, 1 is rated as Category II according to the Ecology rating system, 23 are rated as Category III, and 4 are rated as Category IV. The majority of wetlands are smaller than 0.5 acre, except Wetlands WSE8 (0.66 acre), WMT6 (1.12 acres), and WLY4 (16.59 acres). All wetlands in the study area are in areas characterized by urban and residential land use where the natural environment has been altered.

3.3.1 Hydrology

Signs of altered hydrology were evident in most wetlands, due to the urbanization and development throughout the study area. Historically, wetlands have been altered in several ways, such as filling, ditching, bisecting, and clearing. Human alterations, such as excavation and stormwater runoff, have also created or enlarged wetlands. Many study area wetlands are within maintained rights-of-way where they receive stormwater runoff from pipes, ditches, or overland flow. Other sources of hydrology include a shallow groundwater table, precipitation, and overbank flow from adjacent streams.

3.3.2 Soils

Soil survey data from the NRCS Web site are not available for the portions of the study area within King County (cities of Seattle and Shoreline). Because of urbanization and development, most of the study area in Snohomish County (cities of Mountlake Terrace and Lynnwood) is mapped as Urban land.

3.3.3 Vegetation

Most wetlands in the study area contain forested, scrub-shrub, or emergent habitat (see USFWS classes for each wetland in Tables 3-4 and 3-5). One wetland (Wetland PWLY5) lacks vegetation (i.e., unconsolidated bottom). Vegetation in the study area wetlands is a mix of native and non-native species, many of which are disturbance-tolerant. Surrounding buffers range from forested to herbaceous cover; disturbance-tolerant species are common.

3.3.4 Jurisdictional Determination

Sound Transit will request jurisdictional determinations of those wetlands that are likely to be affected along the Preferred Alternative during the permitting phase of this project.

4 ENVIRONMENTAL CONSEQUENCES

This chapter describes the potential impacts of the Lynnwood Link Extension on aquatic species and habitat; vegetation, terrestrial wildlife, and wildlife habitat; and wetlands. The discussion of project impacts assumes that the BMPs described in Appendix A would be implemented and performed as expected to avoid and minimize certain impacts during construction.

Sound Transit prepared a Biological Assessment to serve as the basis for consultation with USFWS and NOAA Fisheries concerning the potential effects of the Preferred Alternative on ESA-listed species and critical habitat (Sound Transit 2014). Based on the analysis in that document, and on the implementation of proposed mitigation measures, FTA determined that construction of the Lynnwood Link Extension may affect, but is not likely to adversely affect, ESA-listed species and critical habitat. The Biological Assessment also included a proposed determination of "no adverse effect" on essential fish habitat protected under the Magnuson-Stevens Fishery Conservation and Management Act.

4.1 Aquatic Species and Habitat

Construction of the Lynnwood Link Extension could affect aquatic species and habitat in the study area. Analyses in this subsection address the potential long-term, construction-related, and indirect impacts of each alternative. These impacts are defined as follows:

- Long-term impacts include permanent loss or degradation of in-stream or riparian habitat, altered hydrology, degradation of water quality, or changes in habitat connectivity (e.g., fish passage).
- Construction-related impacts include temporary loss or degradation of in-stream or riparian habitat (including hydrology or water quality), or disturbance from in-water work.
- Indirect and secondary impacts include those related to residential and commercial development near stations, or impacts on other resources from mitigation measures.

Analyses in this subsection focus on salmonid fish species and their habitat because salmonids include the species of greatest concern in Pacific Northwest freshwater environments. Because the habitat requirements and mode of potential impacts are so similar for the salmonid species present, the analysis is combined for all salmonid species; however, species-specific impacts are identified where appropriate. All federally listed threatened and endangered aquatic species that may occur in the study area are all salmonids and are, therefore, addressed in the combined analysis. The discussion herein is thus limited to the potential for project impacts on all species based on the proximity of their known habitat in the project vicinity. Impacts on essential fish habitat are similarly included in the generic analysis and are not discussed separately.

Discussions of long-term and construction-related impacts include assessing the range of impacts that could occur for each project segment and alternative. Actual impacts would depend on final alternative selection and design, construction footprint and methods, BMPs implemented during

construction, and performance of post-construction restoration, including revegetation of disturbed areas and mitigation for impacts on areas protected under local Critical Areas Ordinances.

4.1.1 Long-Term Impacts

Direct long-term impacts could occur where the project limits cross streams or stream buffers. The project limits include the guideway, station footprints (including parking), roadway improvements, storm drainage ponds, ancillary features, and analytical buffer (Section 1.4.1, Impact Assessment). In addition, a 15-foot clear zone would be maintained on either side of the guideway to prevent damage to catenary wires from falling vegetation. Existing trees in this zone would be cleared and no trees would be planted. For this analysis, all impacts within these areas are considered long-term (see explanation in Section 1.4, Assumptions). Sound Transit will re-evaluate this assumption and identify temporary construction limits during the permitting phase. As noted in Section 1.4, Assumptions, some trees in areas adjacent to the analytical buffer may need to be removed to protect light rail safety and reliability. Removal of such hazard trees may accompany construction of any of the light rail alternatives, and it may continue as a maintenance activity during the operational life of project facilities.

Under the Preferred Alternative or any of the other light rail alternatives, construction and operation of guideways, stations, and ancillary features would not directly affect in-stream habitat in most streams in the study area because all streams would be spanned by elevated structures. No structures would be placed below the OHWM of any streams except for Stream SMT1 in Mountlake Terrace and Scriber Creek in Lynnwood. Construction of elevated crossings at Stream SMT1 and Scriber Creek would entail the placement of support columns in areas that receive seasonal or intermittent flow, thus reducing the availability of aquatic habitat and potentially modifying channel morphology and flow dynamics. Conversely, the presence of elevated guideways over stream habitat could have a beneficial effect, creating shade that helps keep water temperatures low. Additional information about the potential long-term impacts of structures below the OHWM of these streams is provided in the discussions of Segment B (Stream SMT1) and Segment C (Scriber Creek), below. Any work below the OHWM of any streams in the study area would be conducted in accordance with the terms of the Hydraulic Project Approval (HPA) and other applicable permits obtained for this project.

Operation of the light rail system would not be expected to result in any increases in nighttime illumination of fish-bearing waters (which could increase the risk of predation on juvenile salmonids) because the tracks would have no overhead lighting and the train headlights would be directed parallel to the tracks. Under the Preferred Alternative, lighting at light rail stations would not result in any adverse effects because no stations would be located within 200 feet of any fish-bearing streams. The same would be true of all other light rail alternatives with the possible exception of Alternative C2, under which the Lynnwood Transit Center Station would be approximately 100 feet from the northeastern margin of the Scriber Creek wetland complex. If that alternative were to be selected, light from the station could reach fish-bearing waters in Scriber Creek, although the dense wetland vegetation would provide substantial screening.

No impacts on fish passage are anticipated under any of the alternatives because the construction of elevated structures at all surface-flowing stream crossings would preclude the need to add new culverts or extend existing culverts. Construction of at-grade or elevated guideways, stations, and ancillary features above piped streams (e.g., Stream SSH2, a tributary to McAleer Creek in Shoreline) would not affect stream habitat. The potential for the construction of guideways, stations, and other facilities to interfere with possible future fish habitat restoration projects is addressed in Section 4.4, Indirect and Secondary Impacts.

No construction of at-grade guideways, stations, or ancillary features would occur within the regulatory buffers of any surface-flowing streams in the study area. This would not necessarily preclude all potential adverse effects on stream habitat, however. The loss of forest habitat at considerable distances from streams—even up to 200 feet—can reduce the amount of wood available for recruitment to those streams (Knutson and Naef 1997). Notably, studies conducted in western Washington, western Oregon, and southeast Alaska indicate that more than 90 percent of large woody debris input to streams from riparian areas is recruited from the areas within one-half of a site potential tree height[3] (Murphy and Koski 1989; McDade et al. 1990; McKinley 1997; Martin et al. 1998). Based on an estimated site potential tree height of 200 feet, most potential recruitment of large woody debris to study area streams would be expected to come from the areas within regulatory buffers, and nearly all recruitment would come from within 100 feet. Construction of at-grade facilities outside of regulatory buffers, therefore, would likely result in minimal reductions in wood recruitment to study area streams.

Permanent impacts on riparian habitat may also occur where elevated guideways span areas of riparian vegetation. Construction of elevated guideways above vegetation would reduce the amount of water the vegetation receives from precipitation. In addition, guideways with low clearance (generally, less than 15 feet) would also limit sunlight. In some areas, vegetation cleared from beneath elevated guideways may not grow back. The presence of elevated guideways would preclude the development of mature forest habitat in such areas, reducing the potential for the recruitment of large woody debris to nearby streams. Because the elevated guideway structures would be relatively narrow (31 feet wide) and generally more than 15 feet above the ground surface, shading impacts on riparian vegetation would be limited in most areas, although some impacts would result from shading and water interception. As observed on the Sound Transit Central Link project, herbaceous plants and shrubs are generally able to grow beneath narrow guideways that are at least 15 feet above the ground (Sound Transit 2011) as long as there is a source of water.

Based on the nature and location of buffer impacts, as well as the current condition of the buffers themselves, no substantial degradation of riparian functions (e.g., fish and wildlife habitat, food chain support, or water temperature maintenance) or processes would likely result from project-related clearing under any of the alternatives. The riparian processes that would likely not be affected include water flow; erosion and accretion; infiltration; groundwater recharge and discharge;

[3] Site potential tree height is the average maximum height of the tallest dominant trees (200 years or older) at a given location, based on the soil and climatic conditions at that site. Site potential tree heights of 200 feet are not uncommon in the Puget Sound lowlands.

sediment delivery, transport, and storage; organic matter input; nutrient and pathogen removal; and stream channel formation and maintenance. Under the Preferred Alternative or any of the other light rail alternatives, Sound Transit would use native vegetation when replanting areas disturbed by construction. At sites where riparian zones are currently dominated by non-native species, the reintroduction of native vegetation could lead to long-term improvements in riparian habitat conditions.

Long-term impacts could be caused by increases in the amount of impervious surface in the study area, which can increase stormwater runoff rates, volumes, and pollutant loads. These, in turn, can lead to higher peak flows and degrade water quality in streams. New impervious areas would include new tracks and guideways, stations, park-and-ride lots, and roads. In general, elevated segments would result in less new impervious area than at-grade segments because the pervious ground would be retained underneath elevated segments in most areas. Project features that do not receive motor vehicle traffic, such as guideways (both elevated and at-grade) and stations, would not be pollution-generating impervious surfaces (PGIS). Project-related parking lots (including new park-and-ride facilities) and road realignments would receive motor vehicle traffic and would, therefore, be PGIS.

Conceptual engineering has been completed for the major stormwater detention and treatment facilities necessary for the Preferred Alternative. Sound Transit used a conservative approach in developing drainage concepts. Sound Transit applied the Western Washington Hydrology Model, Version 3.0, to analyze project hydrology and to determine sizing of the facilities. Detention facilities were designed to achieve post-project stormwater flows equivalent to forested conditions, as required by Ecology. Most stormwater is expected to be discharged to existing city drainage facilities that discharge to water bodies from existing permitted municipal discharge locations. The amount of area detained would be sufficient to offset any increase in impervious surface area under any of the alternatives. Based on the implementation of these BMPs, peak flows would not be expected to increase in any of the streams in the study area as a result of the project; moreover, base flows would be expected to remain similar to current conditions. Stormwater from all project-related impervious surfaces would receive appropriate flow control. In addition, stormwater from PGIS associated with the project would also receive water quality treatment.

In some areas, especially in Segment C, existing pollution-generating segments of I-5 and commercial parking areas would be spanned by elevated portions of light rail. In these areas, precipitation that might otherwise have fallen on pollution-generating surfaces would fall instead on the non-pollution-generating surface of the elevated guideway. The result would, in effect, be a conversion from pollution-generating to non-pollution-generating impervious surface, potentially reducing the overall amount of PGIS in the study area. Based on the water resources impact analysis, none of the alternatives would degrade existing water quality. In addition, the light rail system could reduce future increases in traffic volume in the study area, which would indicate the likelihood of lower levels of pollutant increases associated with motor vehicle traffic.

The light rail alternatives would be designed to comply with the following local design manuals:

- WSDOT 2014 *Highway Runoff Manual*
- City of Seattle: *City of Seattle Flow Control and Water Quality Treatment Technical Requirements Manual*, Volume 3
- City of Shoreline: *Stormwater Management Manual for Western Washington* (Ecology 2012b); *City of Shoreline 2012 Engineering Development Manual*; *Low Impact Development, Technical Guidance for Puget Sound* (Hinman 2012)
- City of Mountlake Terrace: *Stormwater Management Manual for Western Washington* (Ecology 2012b)
- City of Lynnwood: *Stormwater Management Manual for Western Washington* (the City currently uses the 2005 manual but is expected to adopt the 2012 manual by the time project design is underway.)

The light rail alternatives would be designed to meet standards of the applicable jurisdiction and Ecology's *Stormwater Management Manual for Western Washington*. If a local jurisdiction has more stringent design requirements than those in the Stormwater Management Manual, then Sound Transit would apply the local requirements in the applicable areas.

Sound Transit's preliminary engineering for the Lynnwood Link Extension includes development of a conceptual layout for major stormwater facilities that are sized to comply with Sound Transit's *Design Criteria Manual* (Sound Transit 2012), which requires stormwater facilities for its projects to conform to the requirements of local jurisdictions. These facilities include stormwater ponds and underground vaults. Additional measures to reduce stormwater runoff, such as low-impact development or other on-site measures, would be considered at a more advanced phase of project development. Given Sound Transit's commitment to design the project to meet the stormwater management requirements of each jurisdiction, the light rail alternatives are not expected to adversely affect surface waters.

Peak stream flows in the study area would not be expected to increase substantially under any of the alternatives because the stormwater systems built for the project would be designed to simulate pre-development hydrology. As stated in the *Stormwater Management Manual for Western Washington,* "The Manual is intended to provide project proponents, regulatory agencies and others with technically sound stormwater management practices which are presumed to protect water quality and in-stream habitat – and meet the stated environmental objectives of the regulations described in this chapter." It is possible, however, that discharges from stormwater detention facilities could result in increased water velocities and durations in receiving waters, potentially reducing the availability of prey and displacing juvenile salmonids from cover (Tschaplinski and Hartman 1983).

In addition, impervious surfaces preclude natural infiltration of precipitation into the ground, decreasing groundwater recharge. Less precipitation entering groundwater aquifers might decrease dry-season base flows by decreasing water inputs to streams from groundwater sources such as springs. Dry-season base flows have been identified as one of the most important natural limiting factors controlling salmonid production in lowland Puget Sound streams.

Where low-impact development measures are implemented, some stormwater runoff from project-related impervious surfaces would be collected and infiltrated into the ground. In some areas, this could result in increased groundwater recharge compared to existing conditions (under which stormwater runoff is managed mainly through vaults and ponds that do not infiltrate). However, some soil types in the project area are not conducive to infiltration of precipitation into the ground.

It is assumed for this analysis that the risk of adverse effects on peak and base flows would correspond with the amount of proposed new impervious surface. The less impervious surface in an alternative, the lower the potential for adverse effects in a given basin. Alternatives with longer elevated guideways or more elevated stations would likely have less impact on base flows compared to alternatives with more at-grade guideway and/or road widening. Even the alternative with the highest increase in impervious surface would only have a minor impact at a basin-wide level because the light rail alternatives would affect a small proportion of the basin relative to the existing impervious surfaces within the basin. Additional analysis of potential stormwater-related effects can be found in the Biological Assessment for this project (Sound Transit 2014).

No Build Alternative

The No Build Alternative would not have any direct long-term impacts on aquatic species or habitat. Conversely, implementing the No Build Alternative would not have potential beneficial environmental effects over the long term, such as reducing increases in motor vehicle traffic in the region, facilitating the concentration of residential and commercial growth in planned growth centers, or implementing compensatory mitigation for impacts on wetlands, streams, and their required buffers.

Segment A: Seattle to Shoreline

Table 4-1 summarizes the amount of stream (in linear feet of open [i.e., not piped] stream channel) and stream buffer area (in acres, based on the width of the regulatory stream buffer in the local jurisdiction) that would be affected by each alternative in each segment. The Preferred Alternative and all other Segment A alternatives would cross Thornton Creek at the same location and would, therefore, affect equal amounts of Thornton Creek and its regulatory buffer[4]. Similarly, all of the alternatives would follow the same route in the vicinity of the watercourse (SSE1) along 5th Avenue NE south of Thornton Creek, affecting equal amounts of the regulatory buffer for that watercourse[5]. Based on the condition of the riparian habitat in the analysis buffers for both watercourses, the potential for adverse effects would be minimal.

Segment B: Shoreline to Mountlake Terrace

Elevated portions of the guideway of the Preferred Alternative would cross a piped portion of the main stem of McAleer Creek immediately east of I-5 and would pass through the regulatory buffers

[4] The segments of Thornton Creek and SSE1 that would be affected are in the Seattle city limits within the road right-of-way (not on a publicly or privately owned parcel) and may not be subject to the City of Seattle Critical Areas Ordinance (Seattle Municipal Code 25.09).

of surface-flowing segments of that stream at the I 5/SR 104 interchange, affecting approximately 0.5 acre of regulatory buffer. In addition, an elevated portion of the Preferred Alternative would pass over a segment of Stream SMT1 south of the Mountlake Terrace Transit Center, affecting approximately 0.5 acre of that stream's regulatory buffer.

Table 4-1. Long-Term Impacts on Streams and Buffers by Project Alternative

Segment/Alternative	Stream Channel Affected (linear feet)	Stream Buffer Area Affected[a] (acres)
Segment A: Seattle to Shoreline		
Preferred Alternative: At-grade/elevated with NE 145th and NE 185th Stations	All Alternatives: Thornton Creek (94)	All Alternatives: Thornton Creek (0.5)[b] SSE1 (0.2)[b]
A1: At-grade/Elevated with NE 145th and NE 185th Stations		
A3: Mostly Elevated with NE 145th and NE 185th Stations		
A5: At-grade/Elevated with NE 130th, NE 155th, and NE 185th Stations		
A7: Mostly Elevated with NE 130th, NE 155th, and NE 185th Stations		
A10: At-grade/Elevated with NE 130th, NE 145th, and NE 185th Stations		
A11: Mostly Elevated with NE 130th, NE 145th, and NE 185th Stations		
Segment B: Shoreline to Mountlake Terrace		
Preferred Alternative (B2 Modified): East Side to Mountlake Terrace Transit Center to West Side (with or without 220th Street SW Station option)	SMT1 (208)	McAleer Creek (0.5) SMT1 (0.5) SSH2 (<0.1) SSH4 (<0.1)
B1: East Side to Mountlake Terrace Transit Center to Median	SMT1 (231)	McAleer Creek (0.5) SMT1 (0.5) SSH2 (<0.1) SSH4 (<0.1)
B2A: East Side to Mountlake Terrace Transit Center to West Side with Optional 220th Street SW Station	SMT1 (231)	McAleer Creek (0.5) SMT1 (0.5) SSH2 (<0.1) SSH4 (<0.1)
B4: East Side to Mountlake Terrace Freeway Station to Median	McAleer Creek (40)	McAleer Creek (0.7) SSH2 (<0.1) SSH4 (<0.1)
Segment C: Mountlake Terrace to Lynnwood		
Preferred Alternative (C3 Modified): Along I-5 to Lynnwood Park-and-Ride Station	Scriber Creek (147)	Scriber Creek (0.5)[c]
C1: 52nd Avenue West to 200th Street SW	Scriber Creek (51)	Scriber Creek (0.2)
C2: 52nd Avenue West to Lynnwood Transit Center	Scriber Creek (143) SLY1 (58)	Scriber Creek (0.9)[c] SLY1 (0.1)
C3: Along I-5 to Lynnwood Park-and-Ride	Scriber Creek (131) SLY1 (81)	Scriber Creek (0.1)[c] SLY1 (0.1)

[a] Values presented in this table represent all affected areas inside the regulatory stream buffers within each local jurisdiction, including areas that overlap with wetlands or wetland buffers. Note that all values are preliminary estimates and most impacts would likely be temporary; see discussion in Section 1.4, Assumptions.

[b] Buffer impacts are not on publicly or privately owned parcels and may not be subject to the City of Seattle Critical Areas Ordinance (Seattle Municipal Code 25.09).

[c] The portions of Scriber Creek that would be crossed by the Preferred Alternative and Alternatives C2 and C3 are within the Scriber Creek wetland complex. Based on the preliminary determination that the OHWM of the stream coincides with the outer boundary of the wetland complex, potential impacts to aquatic resources under those alternatives in Scriber Creek are calculated as the area of the project footprint overlapping the wetland complex. Stream buffer impacts are described qualitatively in the accompanying text.

At the elevated crossing of the Preferred Alternative over Stream SMT1, a portion of one guideway support column would be below the OHWM of that watercourse. Stream SMT1 at that location flows intermittently and is not known or expected to support fish. Therefore, the presence of a guideway support column in a portion of the stream channel would not be expected to affect the amount or quality of fish habitat in Stream SMT1. However, the design of any future stream habitat restoration projects could be complicated by the presence of the structure.

The Preferred Alternative would also affect less than 0.1 acre apiece of the regulatory buffers for Streams SSH2 and SSH4. No streams are present in the study area near 220th Street SW, so the design options for the 220th Street SW Station would not be expected to differ in their impacts on stream buffers.

Alternatives B1 and B2A would cross a piped portion of the main stem of McAleer Creek at the same location as the Preferred Alternative, immediately east of I-5. Both alternatives would pass through regulatory buffers surrounding open segments of McAleer Creek and Stream SSH4 in the cities of Mountlake Terrace and Shoreline, affecting equal amounts of those buffer areas (Table 4-1).

Alternative B4 would cross an open segment of McAleer Creek where it exits the culvert under I-5, spanning approximately 39 linear feet of the stream (Table 4-1). Also, because it would pass closer to the stream, this alternative would affect more of the stream buffer than Alternatives B1 and B2A. Alternative B4 would also pass closer to Stream SSH4, but would still affect a similarly small portion of that stream's regulatory buffer.

Alternatives B1 and B2A would cross Stream SMT1 at or near the same location as the Preferred Alternative and would affect approximately equal amounts of the stream and its regulatory buffer. The designs of the Alternatives B1 and B2A have not been developed to the same level of detail as for the Preferred Alternative, and the locations of guideway support columns have not been established. However, based on the similarities in the alignments, it is probable that a support column could be placed below the OHWM for Stream SMT1 under Alternative B1 or Alternative B2A, with effects similar to those described for the Preferred Alternative. Alternative B4 would enter the I-5 median south of the Mountlake Terrace Park-and-Ride facility and would not affect Stream SMT1 or any of its buffer areas.

All alternatives for Segment B would cross a piped segment of the southern tributary to McAleer Creek (Stream SSH2) at the same location and would, therefore, affect equal amounts of its regulatory buffer (Table 4-1).

Segment C: Mountlake Terrace to Lynnwood

Each of the Segment C alternatives includes one option that begins in the I-5 median before crossing north to the west side of the freeway near 52nd Avenue West (Option 1) and another option that begins on the west side of the freeway (Option 2). Neither of these options would cross streams or pass through stream buffers, so comparisons of the alternatives do not distinguish between the options.

Under all of the Segment C alternatives, habitats in Scriber Creek and the associated wetland complex would be spanned by elevated guideways, minimizing the potential for direct adverse effects. Each alternative would cross Scriber Creek at a different location, with the elevated guideway passing over slightly different lengths of the stream and affecting slightly different areas of stream buffer (Table 4-1). The amount of Scriber Creek's regulatory buffer affected by the Preferred Alternative would be approximately 0.5 acre. Among the other light rail alternatives, Alternatives C1 and C3 would have the least impact (ranging from 0.1 to 0.2 acre) because they would cross small portions along either the northern (Alternative C1) or southern (Alternative C3) edges of the wetland complex. Alternative C2 (both Options 1 and 2) would have the greatest impact, crossing through the middle of the wetland complex and affecting approximately 0.9 acre of Scriber Creek's regulatory buffer.

Although the amount of area affected by the Segment C alternatives would differ, the overall effects (described under Long-term Impacts, above) would be essentially the same. The guideway would be more than 15 feet above the ground surface in this area, and shading and other impacts on vegetation would likely be minimal. Direct impacts would be limited to the areas occupied by support columns for the guideway.

The construction of support columns for the elevated guideway in the Scriber Creek wetland complex could affect aquatic habitat within Scriber Creek and would result in the permanent loss of some riparian habitat for that stream. In addition to potential direct impacts on the stream, impacts to the wetland complex could adversely affect juvenile salmonids that rear and overwinter in wetland habitats adjacent to Scriber Creek. None of the other wetlands identified in the study area is accessible to juvenile fish. The potential for project construction and operation to adversely affect aquatic species or habitats would be avoided or minimized through the implementation of conservation measures necessary for permit compliance.

Under the Preferred Alternative, the guideway would require 3 pairs of columns to cross the Scriber Creek wetland complex. The designs of the other light rail alternatives have not been developed to the same level of detail as for the Preferred Alternative. However, based on the length of elevated guideway that would pass over the Scriber Creek wetland complex, it is probable that Alternative C2 would require the placement of more than 3 pairs of columns below the OHWM of Scriber Creek, and that Alternative C3 may require as few as 1. It is possible that Alternative C1 could be built without placing any columns below the OHWM of Scriber Creek. Under any of the light rail alternatives, the placement of any structures below the OHWM of any streams in the study area would be done in accordance with the terms of the HPA and other applicable permits obtained for this project.

Under Alternative C2, the tail track of the elevated guideway would extend over a portion of the northern tributary to Scriber Creek (Stream SLY1), crossing both the stream and its regulatory buffer. The Alternative C3 tail track would cross the same stream in a slightly different location and at an oblique angle, and would thus affect slightly more of the stream (Table 4-1). The Preferred Alternative and Alternative C1 would not cross Stream SLY1 or affect any of the stream's regulatory buffer area.

4.1.2 Construction Impacts

Similar to long-term impacts, construction-related impacts would occur where the project limits cross streams or stream buffers. Construction impacts would be temporary, however, and would be limited to the period during and immediately following project construction. The construction period would last 6 years (from beginning of construction to beginning of operation). At most locations, ground-disturbing activities would be expected to last a year or two. Temporarily disturbed sites would be replanted immediately following construction in each project segment, and vegetation would likely become reestablished within a year or two at most sites.

Under the Preferred Alternative or any of the other light rail alternatives, construction of guideways, stations, and ancillary features would take place above the OHWM of all but two streams in the study area. As such, project construction would not cause disturbance of in-stream habitat in most streams. Construction of elevated crossings at SMT1 and Scriber Creek would entail some work below the OHWM of those two streams. Additional information about the potential impacts of project construction below the OHWM of these streams is provided in the discussions of Segment B (Stream SMT1) and Segment C (Scriber Creek), below. Any work below the OHWM of any streams in the study area would be conducted in accordance with the terms of the HPA and other applicable permits obtained for this project.

The use of artificial lighting in association with nighttime construction could affect fish in study area streams. Research suggests that changes in ambient light may alter migratory behavior or affect predation rates on juvenile salmonids (Tabor et al. 2004).

Any earthwork conducted within a basin has the potential to cause sedimentation that would adversely affect the streams in the basin downstream of the work activity. The most obvious situation in which sedimentation could occur is where earthwork construction occurs in or next to a stream channel. However, any earthwork in a basin might contribute to the already serious sedimentation problems that exist in the streams in the project vicinity. This is because most stormwater in urban settings is collected in a system of pipes or ditches and conveyed directly to the nearest stream. An exception to this practice is in newer developments, where stormwater detention facilities trap much of the sediment carried by upstream sources before discharging into streams. But even in these developments, some of the finer sediments might be discharged to streams as the ponds fill with stormwater and overflow.

The types of adverse impacts from excessive sediment in streams are well documented, and salmonid ecosystems experience a wide range of adverse impacts. For example, excessive sediment might preclude salmonid spawning or successful egg incubation, or it might lower egg survival. The production and diversity of benthic invertebrates—the primary food source of juvenile salmon and resident trout—are reduced as sediment loading increases. Shelter for juvenile salmonids is decreased as the voids between rocks are filled with sediment. Pools may also become full of sediment if loading is high.

Erosion control BMPs are designed to avoid or minimize sediment delivery to streams (Appendix A). The degree to which they are effective depends on correct installation but also on

unpredictable circumstances. For instance, conventional BMPs may fail when subjected to extreme rainfall or rain-on-snow events.

Any time heavy equipment is fueled or hydraulic systems are used during construction, fuel or hydraulic fluid has the potential to be spilled. Even though a Spill Prevention, Control, and Countermeasures Plan would be implemented, there is still a possibility that some of this material could be carried by stormwater and enter a stream. Because stormwater throughout a basin ends up in a stream, stormwater entering a storm drain far from a stream is eventually carried to it. Spill prevention BMPs are designed to avoid or minimize construction-related pollutants from entering streams; however, despite precautions, a low risk still exists for release of pollutants to streams in the study area.

Within each project segment, the risk of construction impacts would be a product of the total amount of ground-disturbing activity within each basin. Construction adjacent to or within streams, wetlands, or their buffers, including work on elevated guideways that pass over these features, would have the highest risk of delivering sediment and pollutants to downstream waters. As noted in Section 1.4, Assumptions, detailed construction limits are not defined at this phase in the project design. For this analysis, potential construction limits have been estimated, identifying areas where temporary impacts on streams and stream buffers could extend beyond the analytical buffer defined for the analysis of long-term impacts.

No Build Alternative

The No Build Alternative would not have any temporary, construction-related impacts on aquatic species or habitat.

Segment A: Seattle to Shoreline

The Preferred Alternative and all other light rail alternatives in Segment A would cross Thornton Creek at the same location and would, therefore, pose equal risks of construction-related impacts to the stream. The analysis of potential construction impacts did not identify any areas where temporary impacts on Thornton Creek or its buffer could extend beyond the analytical buffer defined for the analysis of long-term impacts.

Segment B: Shoreline to Mountlake Terrace

At the elevated crossing of the Preferred Alternative over Stream SMT1, a portion of one guideway support column would be below the OHWM of that watercourse. Based on the similarities in the alignments, Alternatives B1 and B2A would likely require support columns at the same location. Stream SMT1 at that location flows intermittently and is neither known nor expected to support fish. In addition, work below the OHWM would take place in accordance with federal and state permits, which typically limit such work to periods when water levels are lowest. During such periods, water is present in the SMT1 stream channel at that location only during and immediately following measurable rainfall. It is unlikely, therefore, that any construction work would take place within the channel of SMT1 when water is present, largely eliminating the potential for sediment or

pollutants from construction areas to be carried downstream to fish-bearing waters. This potential would be further reduced by the implementation of BMPs that impose requirements for the stabilization of disturbed soil and that restrict machinery use below the OHWM. Lastly, Sound Transit would comply with water quality mixing zone requirements established by Ecology. For streams with flows of 10 cubic feet per second or less during construction, the water quality mixing zone is 100 feet downstream of project activities (WAC 173-201A-200-1[e]). Summer-season flows at the mouth of perennially flowing McAleer Creek (several miles downstream of the study area) are consistently less than 10 cubic feet per second (Sound Transit 2014), meaning any flows in Stream SMT1—an intermittently flowing tributary to McAleer Creek—would remain well below that rate. The nearest fish-bearing waters are more than 2,000 feet downstream from the proposed crossing location, well beyond the water quality mixing zone. For all of the reasons listed above, construction activities below the OHWM of Stream SMT1 would not be expected to result in elevated levels of sediment or pollutants in fish-bearing waters downstream.

Based on the amount of stream buffer area affected, the Preferred Alternative and Alternatives B1 and B2A would pose equal risks of delivering sediment or pollutants to the main stem of McAleer Creek and to the surface-flowing tributaries in the study area (Streams SSH4 and SMT1) (Table 4-1). In addition to the areas subject to long-term effects, 0.4 acre of the stream buffer for McAleer Creek could be subject to temporary, construction-related impacts under those three alternatives, as would 0.2 acre of the buffer for Stream SMT1. The buffer for Stream SSH4 would not be subject to temporary, construction-related impacts under any of the Segment B alternatives.

Although a larger area of the McAleer Creek buffer would be subject to potential long-term impacts under Alternative B4 compared to the other Segment B alternatives (Table 4-1), the analysis of potential construction impacts did not identify any areas where the temporary impacts of Alternative B4 on the McAleer Creek buffer would extend beyond the analytical buffer defined for the analysis of long-term impacts. Similarly, Alternative B4 would subject a smaller portion of the buffer on Stream SMT1 to potential long-term impacts, compared to the other Segment B alternatives (Table 4-1), and none of that buffer would be subject to potential additional construction impacts. As a result, the risk of construction-related impacts to McAleer Creek, Stream SSH4, and Stream SMT1 would likely be less under Alternative B4 than under the other alternatives. Because the southern tributary to McAleer Creek (Stream SSH2) is entirely within culverts in the study area, none of the alternatives would have the potential to deliver sediment or pollutants to that watercourse.

Segment C: Mountlake Terrace to Lynnwood

Based on the amount of wetlands, wetland buffers, and stream buffers that would fall within the project footprint along the northern tributary to Scriber Creek (Stream SLY1) and in the Scriber Creek wetland complex, Alternatives C1 and C3 would have the lowest risk of construction-related impacts. The risk for the Preferred Alternative would be slightly higher, and that for Alternative C2 would be highest.

To minimize the potential for impacts on ecosystem resources in Scriber Creek and the associated wetland complex, temporary work trestles would be used for equipment access during construction of

the elevated guideway for the light rail alternatives that cross substantial portions of the Scriber Creek wetland complex (i.e., the Preferred Alternative and Alternative C2; it is unlikely that a temporary work trestle would be needed under Alternative C1 and a trestle may be needed under Alternative C3). The trestles would be supported by steel piles and would remain in position only as long as needed for the completion of project construction. Any in-water work for trestle construction (including pile driving and pile removal) would be conducted in accordance with the terms of the HPA and other applicable permits obtained for the project. Such permits typically place restrictions on the time of year when work can be conducted below the OHWM of any streams. These permits also typically include numerous provisions aimed at avoiding or minimizing the potential for adverse effects on fish and aquatic habitat (discussed in Section 4.6, Potential Mitigation Measures).

The temporary work trestles would consist of pile-supported platforms, about 30 feet wide, with heavy timber decking supported by steel beams. Pile bents (lateral rows of three to four piles) would be spaced at 30- to 50-foot intervals, with each pile driven below the mudline to a depth sufficient to support the large cranes and other equipment needed for construction of the elevated guideway. The spacing of the pile bents will be optimized to reduce the number of piles needed while providing sufficient structural support. A vibratory hammer would be used for initial installation of most piles. If substrates preclude the use of a vibratory hammer, an impact hammer would be used. For all piles, an impact hammer would be used to complete the installation and to confirm the load-bearing capacity of each pile.

Work below the OHWM would take place in accordance with federal and state permits that typically limit such work to periods when water levels are lowest. During these periods, surface water in the wetland complex is generally found only in the actively flowing stream channels of Scriber Creek, which make up only a small portion of total wetland complex area. Most work below the OHWM would take place in areas where no standing or flowing water is present. Any work areas where surface water is present would be isolated from other surface waters with a coffer dam or similar system to prevent suspended sediment or pollutants from leaving the work area. For these reasons, in-water work in Scriber Creek, if it occurs, would not be expected to contribute to elevated levels of sediment or pollutants in fish-bearing waters.

4.2 Vegetation, Terrestrial Wildlife, and Wildlife Habitat

Construction of the Lynnwood Link Extension could affect vegetation in the study area, including terrestrial wildlife species associated with those habitats. Analyses in this subsection address the potential long-term, construction-related, and indirect impacts of each alternative on vegetation and wildlife. These impacts are defined as follows:

- Long-term impacts include permanent loss or degradation of terrestrial habitat (including habitat connectivity); disturbance due to increased human access, noise, and light; impacts on rare plant populations; or contributions to the spread of noxious or invasive plant species.

- Construction-related impacts include temporary loss or degradation of terrestrial habitat, or disturbance due to construction-related noise and light.
- Indirect and secondary impacts include those related to residential and commercial development near stations, or mitigation measures for other resources.

As noted in Section 3.2.3, no terrestrial ESA-listed or state-listed threatened or endangered plant or wildlife species are known or expected to occur in the study area. Analyses in this section, therefore, address plant and wildlife species collectively, basing the anticipated impacts on the relationships between habitats and individual species or species groups. The following subsections describe the potential impacts on vegetation and wildlife that could result from construction and operation of the Preferred Alternative or any of the other light rail alternatives. Discussions of long-term and construction-related impacts include assessments of the range of impacts that could occur for each segment and alternative. Actual impacts would depend on final alternative selection and design, construction footprint and methods, BMPs implemented during construction, and performance of post-construction restoration, including revegetation of disturbed areas and mitigation measures for areas protected under local Critical Areas Ordinances.

4.2.1 Long-Term Impacts

Direct long-term impacts would occur where the project limits cross land cover types that support vegetation or other wildlife habitat features. Clearing for project construction would also increase the risk of contributing to the spread of noxious or invasive weed species. Noise and human activity associated with operation of the light rail system may also result in long-term impacts. The project limits include the guideway, station footprints (including parking), roadway improvements, storm drainage ponds, ancillary features, and analytical buffer (Section 1.4.1, Impact Assessment). For this analysis, all impacts within these areas are considered long-term. As explained in Section 1.4 (Assumptions), analyses in this report treat the construction of both at-grade and elevated guideways and other structures as long-term impacts on vegetation and other resources within the structure's footprint. Sound Transit will re-evaluate this assumption and identify temporary construction limits during the permitting phase.

Vegetation and Wildlife Habitat Loss

Under the Preferred Alternative or any of the other light rail alternatives, the effects of project construction on vegetation and wildlife habitat would depend on the land cover type within the project clearing limits. The effects on the Urban cover type, for example, would be minimal. Little or no vegetation is present in areas classified as Urban; therefore, the replacement of existing cover with guideways or other facilities would constitute a minimal change in the characteristics of such areas or their ability to support wildlife. Similarly, areas classified as Residential or Maintained Vegetation are highly modified from pre-development conditions and typically occur alongside roads and other areas with low habitat value. In addition, invasive species are common in such areas. Although project construction in most Residential or Maintained Vegetation areas would constitute a change from a vegetated area to impervious surface, the effects of such construction on

vegetation and wildlife would, therefore, be minimal. (The effects of increases in impervious surface are discussed in Section 4.1.1). No areas classified as Open Water fall within the footprint of any of the project alternatives.

Although the potential for adverse effects would be low, operation of any of the light rail alternatives could result in some adverse effects on vegetation and wildlife over the long term. For example, maintenance activities that involve the removal of vegetation or structures that support bird nests (e.g., bridges, overpasses) during the breeding season could destroy nests, eggs, or birds protected under the Migratory Bird Treaty Act. At-grade guideways and other facilities in grassy areas (e.g., along the margins of I-5) would reduce the amount of habitat for voles and other species that are prey for raptors. In addition, disturbance of comparatively natural land cover types in the study area could have some adverse effects, as discussed below.

The two cover types in which project construction could cause changes in habitat quality are Shrub and Forest. The following subsections focus on assessing the range of impacts that could occur on these two land cover types for each segment and alternative. In both cover types, replacement of existing vegetation with project features would represent a loss of structural and biotic diversity associated with the variety of plant and wildlife species previously present in the cleared areas. In areas classified as Shrub, the potential for adverse effects would vary with site-specific conditions. For example, areas dominated by dense growth of invasive species (e.g., Himalayan blackberry, Japanese knotweed [*Polygonum cuspidatum*]) typically do not support diverse and abundant communities of vegetation and wildlife. Conversely, areas with more native species (e.g., salal, salmonberry, or red alder) typically support a greater number and variety of species.

For this analysis, the amount of Forest cover affected by each alternative is used to indicate the potential for long-term adverse effects on vegetation and wildlife. Construction of project features would have a greater likelihood of reducing the habitat quality of forested areas than other cover types. The removal of trees, snags, and understory vegetation would remove potential nesting sites, foraging sites, and hiding cover for many species of birds and small mammals. The introduction of cleared areas through patches of contiguous forest cover would result in the fragmentation of the forested habitat. By increasing the amount of edge habitat (where sensitive wildlife species are less protected from weather extremes and are more susceptible to predation from species that are adapted to open habitats), fragmentation compounds the effects of habitat loss by reducing the quality of the remaining habitat. Vegetation clearing would contribute to habitat fragmentation within the study area. However, because the Preferred Alternative or other light rail alternatives would be built alongside the I-5 corridor (an existing impediment to migration by terrestrial species), they would not affect areas that serve as connective corridors to other areas of habitat outside of the study area.

Noxious Weeds

Noxious weeds and exotic plants rapidly colonize disturbed sites such as construction areas. They prevent native species from becoming re-established following ground disturbance, spread into undisturbed areas where they can affect habitat value on additional lands, and provide very poor

wildlife habitat or forage. Several of the BMPs that would be implemented during project construction are intended to avoid, reduce, and control new infestations of noxious weeds (see Appendix A). Consistent and successful application of these measures would reduce potential habitat disturbance and improve existing habitats that are already disturbed.

Despite the implementation of BMPs, it is likely that some especially invasive weeds such as Himalayan blackberry could become established in some areas disturbed during construction. However, the Lynnwood Link Extension could also improve conditions where existing noxious weeds such as Himalayan blackberry, reed canarygrass, or Japanese knotweed dominate vegetated areas within the study area. Because of project construction, such areas would either be replaced with project features or disturbed and replanted with native species, increasing the potential for re-establishment of native vegetation.

Noise and Human Activity

Both noise and human activity have been demonstrated to displace wildlife from occupied habitats, interfere with the ability to hear territorial songs in birds, interfere with mating and alarm calls of amphibians and small mammals, and interfere with raptor foraging activities. Numerous studies document the avoidance of roads and similar facilities by wildlife and the disturbance of wildlife by human activity at varying distances. However, most of these studies have considered the impacts of new construction or facilities and human activities in areas where none or few of these facilities or human activities previously existed. This is not the case in the Lynnwood Link Extension study area, which is within or immediately adjacent to the I-5 corridor for nearly its entire length. In addition to the noise and vehicle traffic on the highway, regular human activity associated with residential and commercial development is a common feature of the landscape throughout the study area. Wildlife that use habitats adjacent to the project alternatives are more or less accustomed to some level of human activity and noise. Impacts would be related to changes in noise levels and the types of human activities.

In areas where the project alternatives pass through areas outside of the I-5 corridor, the construction of guideways, stations, or other facilities could constitute the introduction of a new source of disturbance in areas where wildlife species are less accustomed to noise and human activity. Animals that are sensitive to noise, light, or other human-related disturbance may be displaced from otherwise suitable habitat, potentially leading to competition with animals that occupy suitable habitat at other, less developed sites. Such competition may produce increased stress and decreased reproductive success for affected individuals. Animals displaced from areas of suitable habitat may also be exposed to an elevated risk of predation or vehicle collisions while they are seeking new areas of suitable habitat. The degree of displacement would generally be proportionate to the change in noise levels over background conditions (which would be a product of the distance between noise sources and areas of occupied habitat), as well as the frequency, duration, and types of noise and human activity. Based on the limited amount of area that would be affected under any of the alternatives, such effects would not be expected to cause changes in the regional populations of any wildlife species.

No Build Alternative

The No Build Alternative would not have any direct long-term impacts on vegetation or wildlife. Conversely, implementing the No Build Alternative would not have potential beneficial environmental effects over the long term, such as concentrating residential and commercial development in planned growth centers. Land development in areas away from such centers could result in the degradation or loss of high-value habitat in outlying and rural areas.

Segment A: Seattle to Shoreline

As a result of the construction of guideways and stations in areas of Shrub along I-5, more of this cover type would be affected by project construction in Segment A than in either of the other two segments (Table 4-2). All six alternatives would affect approximately 10 to 11 acres of this cover type. The alternatives would also affect similar amounts of Forest cover, ranging between 1 and 2 acres. All affected areas of these two cover types would be immediately adjacent to the I-5 corridor. Impacts on these areas, therefore, are not expected to have substantial adverse effects on vegetation or wildlife resources in the study area. Most of the affected area in Segment A would consist of the Residential, Maintained Vegetation, and Urban cover types. None of the Segment A alternatives would affect any forested habitat within the priority habitat area at Northacres Park.

Segment B: Shoreline to Mountlake Terrace

Elevated portions of the guideway for the Preferred Alternative and Alternatives B1 and B2A would pass through the patch of Forest cover (which WDFW [2014b] has identified as a priority habitat area) immediately north of the Mountlake Terrace Transit Center. Construction of a stormwater detention facility on the west side of I-5 near the Mountlake Terrace Station under the Preferred Alternative and Alternative B2A would affect additional Forest cover. As a result of construction in these and other portions of Segment B, the Preferred Alternative and Alternative B2A would each affect approximately 11 acres of Forest, compared to 5 acres under Alternative B1 (Table 4-2). Potential adverse effects of alignment construction in forested areas under these alternatives would include habitat fragmentation and loss and an elevated risk of introducing invasive species, as well as disturbance of sensitive species, as described above. Less Forest cover would be affected under Alternative B4, which would enter the I-5 median south of the Mountlake Terrace Transit Center, thereby avoiding the patch of forested habitat north of the facility (Table 4-2). The design options for the 220th Street SW Station would not differ in their impacts on Forest cover.

A portion of the 11 acres of Forest habitat that would be affected by the Preferred Alternative and Alternative B2A consists of a strip of Forest cover along I-5 in south Lynnwood, north of 220th Street SW. Construction of at-grade portions of the guideway in this area would remove the existing cover altogether. The current habitat value of this strip is limited by its narrow, linear shape and by its location between I-5 and adjacent residential development.

Table 4-2. Long-Term Impacts on Land Cover Types by Project Alternative

	Acres within Project Footprint, by Land Cover Type				
Segment/Alternative	**Forest**	**Shrub**	**Residential**	**Maintained Vegetation**	**Urban**
Segment A: Seattle to Shoreline					
Preferred Alternative: At-grade/elevated with NE 145th and NE 185th Stations	2	10	15	8	13
A1: At-grade/Elevated with NE 145th and NE 185th Street Stations	2	10	13	9	11
A3: Mostly Elevated with NE 145th and NE 185th Street Stations	1	10	13	7	4
A5: At-grade/Elevated with NE 130th, NE 155th, and NE 185th Street Stations	2	11	14	9	7
A7: Mostly Elevated with NE 130th, NE 155th, and NE 185th Street Stations	1	11	13	6	3
A10: At-grade/Elevated with NE 130th, NE 145th, and NE 185th Street Stations	2	10	15	10	8
A11: Mostly Elevated with NE 130th, NE 145th, and NE 185th Street Stations	2	10	13	7	4
Segment B: Shoreline to Mountlake Terrace					
Preferred Alternative (B2 Modified): East Side to Mountlake Terrace Transit Center to West Side	11	3	1	2	8
Preferred Alternative (B2 Modified): East Side to Mountlake Terrace Transit Center to West Side with 220th Street SW Station option	11	4	2	4	9
B1: East Side to Mountlake Terrace Transit Center to Median	5	1	<1	6	7
B2A: East Side to Mountlake Terrace Transit Center to West Side with Optional 220th Street SW Station	11	7	1	3	7
B4: East Side to Mountlake Terrace Freeway Station to Median	3	1	<1	6	5
Segment C: Mountlake Terrace to Lynnwood					
Preferred Alternative (C3 Modified): Along I-5 to Lynnwood Park-and-Ride Station	2	1	<1	1	14
C1: 52nd Avenue West to 200th Street SW, Option 1 (Median)	1	<1	1	1	9
C1: 52nd Avenue West to 200th Street SW, Option 2 (West of I-5)	1	<1	1	0	8

Table 4-2. Long-Term Impacts on Land Cover Types by Project Alternative

Segment/Alternative	Acres within Project Footprint, by Land Cover Type				
	Forest	Shrub	Residential	Maintained Vegetation	Urban
C2: 52nd Avenue West to Lynnwood Transit Center, Option 1 (Median)	<1	2	<1	1	8
C2: 52nd Avenue West to Lynnwood Transit Center, Option 2 (West of I-5)	1	2	<1	0	8
C3: Along I-5 to Lynnwood Park-and-Ride, Option 1 (Median)	1	1	0	2	16
C3: Along I-5 to Lynnwood Park-and-Ride, Option 2 (West of I-5)	2	1	<1	<1	15

The Preferred Alternative and Alternatives B1 and B4 would affect similar amounts of Shrub cover, ranging from 1 to 4 acres. Construction of the 220th Street SW Station and associated parking lot under Alternative B2A would affect a patch of Shrub habitat north of 220th, with a total of 7 acres of this habitat type in the project footprint. Under the Preferred Alternative, the station option would affect slightly greater amounts of Shrub, Residential, Maintained, and Urban cover types than the option with no station (Table 4-2).

Segment C: Mountlake Terrace to Lynnwood

Although the Preferred Alternative and the other Segment C alternatives and options would cross the Scriber Creek wetland complex at different locations, they would not differ substantially in the amounts of Forest and Shrub they would affect (Table 4-2). The west of I-5 option (Option 2) of Alternative C3 would affect more Forest cover than the other alternatives and options. Most of the affected area would consist of a strip of Forest and Shrub along I-5 east of 52nd Avenue West. The guideway would be elevated in this area, limiting the potential for adverse effects on vegetation and wildlife in the area. In addition, the current habitat value of this strip is limited by its narrow, linear shape and its location between I-5 and adjacent commercial development. The two options of Alternative C2, which would pass through the center of the wetland complex, would affect more Shrub than the other alternatives (Table 4-2).

Notably, under all three alternatives, habitats in the Scriber Creek wetland complex would be spanned by elevated guideways. No construction of at-grade facilities would occur in the complex. Construction of elevated guideways can reduce the amount of water and sunlight reaching the vegetation underneath. Because the guideway structure would be relatively narrow (31 feet wide) and generally more than 15 feet above the ground surface, shading impacts on vegetation would be minimal. Constructing any of the Segment C alternatives would not substantially modify the vegetation types beneath the elevated facilities or adversely affect the wildlife communities that use those habitats.

4.2.2 Construction Impacts

Similar to long-term impacts, construction-related impacts would occur where the project limits cross land cover types that support vegetation or other wildlife habitat features. Construction impacts would be temporary, however, and would be limited to the period during and immediately following project construction. The construction period would last 6 years (from beginning of construction to beginning of operation). At most locations, ground-disturbing activities would be expected to last a year or two. Temporarily disturbed sites would be replanted immediately following construction in each project segment, and vegetation would likely become reestablished within a year or two at most sites.

Construction activities under the light rail alternatives would temporarily affect vegetation and wildlife in the study area. Vegetation and wildlife habitat would be temporarily affected by clearing beyond the boundaries of the project footprint (e.g., for access roads or equipment storage areas), as well as clearing beneath elevated structures. Impacts would include the loss of vegetation and habitat, disturbance by noise and construction activity, and displacement of wildlife into potentially less suitable habitats. Construction activities involving the removal of vegetation or structures that support bird nests (e.g., bridges, overpasses) during the breeding season could destroy nests, eggs, or birds protected under the Migratory Bird Treaty Act.

Under any of the light rail alternatives, noise from construction equipment would exceed background noise levels, even in areas where the acoustic environment is currently dominated by traffic noise from I-5. Noise sources would include trucks, cranes, backhoes, loaders, compactors, excavators, grading and paving equipment, vibratory equipment, drilling rigs, forklifts, jackhammers, pumps, compressors, generators, welding equipment, and demolition equipment. The loudest noise levels would result from pile driving required for the construction of temporary work trestles across the Scriber Creek wetland complex under the Preferred Alternative and Alternative C2 (and possibly Alternative C3). Most construction-related noise would be audible up to 650 feet from the project footprint, and pile driving noise would be audible up to 3,100 feet away (Sound Transit 2014).

Wildlife would likely be displaced when construction begins. In areas of temporary vegetation clearance, wildlife species displaced by construction noise would likely return after construction is complete, provided human activity levels return to pre-construction levels. Any such return to pre-construction conditions would depend in part on the re-establishment of vegetation, however, and would not occur immediately. Herbaceous vegetation and some fast-growing shrubs would require 2 to 5 years to return to pre-project conditions. Areas of mature forest would require several decades. Species that forage on or near the ground, such as urban-dwelling small mammals or birds such as juncos and song sparrows, could return to their preferred habitats first. Species that require mature vegetation—especially those that use large shrubs and trees (e.g., wrens, chickadees, and woodpeckers)—would recolonize their preferred habitats last.

Although detailed construction limits are not defined at this phase in the project design, potential construction limits have been estimated near streams, stream buffers, wetlands, and wetland buffers. These consist of areas where temporary impacts could extend beyond the analytical buffer defined

for the analysis of long-term impacts. Additional staging areas could be identified later by the contractor, if needed. Direct construction impacts will be identified during and permitting phase. For the analyses in this document, it is assumed that the level of temporary construction impacts would be commensurate with the level of long-term impacts for each alternative. As with those analyses, the impact assessments focus on the Forest and Shrub land cover types, which would have the greatest potential to be adversely affected by construction of light rail facilities.

No Build Alternative

Implementation of the No Build Alternative would not have any temporary, construction-related impacts on vegetation or wildlife.

Segment A: Seattle to Shoreline

Because of the scarcity of the Forest and Shrub cover types in this portion of the study area, the alternatives would not differ substantially in their construction-related effects on vegetation and wildlife in Segment A.

Segment B: Shoreline to Mountlake Terrace

Based on the amount of Forest and Shrub cover that would fall within the project footprint, construction of the Preferred Alternative and Alternative B2A would have the greatest potential for construction-related impacts on vegetation and wildlife in the study area, followed by Alternative B1. Alternative B4 would enter the I-5 median south of the Mountlake Terrace Transit Center and would, therefore, avoid impacts on most existing vegetated land cover, resulting in a lower potential for construction-related impacts than the other light rail alternatives.

Segment C: Mountlake Terrace to Lynnwood

Based on the amount of the Scriber Creek wetland complex that would fall within the project footprint, construction of Alternative C2 would have the greatest potential for construction-related impacts on vegetation and wildlife in the study area. Alternative C3, which would cross near the southern end of the wetland complex, would affect slightly more of that area than Alternative C1. The effects of the Preferred Alternative would be intermediate between those of Alternative C2 and those of Alternatives C3 and C1. Based on the current habitat value of the strip of Forest and Shrub along I-5 east of 52nd Avenue West, the potential for the west of I-5 option (Option 2) of Alternative C3 to cause substantial construction-related effects on that patch of habitat would be minimal. Pile driving required for the construction of temporary work trestles across the Scriber Creek wetland complex under the Preferred Alternative and Alternative C2 (and possibly Alternative C3) could cause disturbance of wildlife up to 3,100 feet away from work areas.

4.3 Wetlands

Construction of the Lynnwood Link Extension could have impacts on wetlands in the study area. These impacts can be direct (long term), indirect (long term), and temporary (construction):

- Long-term, direct impacts occur when all or a portion of a wetland is filled or excavated so that it becomes a non-wetland.
- Long-term, indirect impacts are typically disturbances that reduce or eliminate wetland functions without directly filling or excavating wetland soils. Indirect impacts occur when permanent wetland impacts result in reduction or elimination of wetland functions in the remaining wetland area, or when alterations to surface water flows separates the remnant wetland from its hydrologic source and prevents it from maintaining wetland hydrology. Reduction of wetland functions occurs when the wetland area is reduced to an extent that it is unable to provide some or all of its pre-disturbance functions. A wetland may become a complete loss when the majority of a wetland is directly affected, leaving the remaining wetland area with altered hydrologic sources and/or reduced pre-project functions.
- Impacts are considered temporary when wetland area and functions are lost for a period of time but are subsequently restored to existing conditions or better.

The following subsections describe the potential impacts on wetlands that could result from the light rail alternatives. The potential for wetland-related impacts to affect fish species is addressed in Section 4.1, Aquatic Species and Habitat. Notably, only one wetland in the study area is accessible to fish. That is Wetland WLY4, the Scriber Creek wetland complex. Discussions of long-term and construction-related impacts include assessing the range of impacts that could occur for each segment and alternative. Actual impacts would depend on the final alternative selection and design, construction footprint and methods, BMPs implemented during construction, performance of post-construction restoration of temporarily disturbed wetlands and buffers, and performance of compensatory mitigation for impacts on areas protected under local Critical Areas Ordinances.

If the impact to any individual wetland or interconnected wetlands exceeds 0.5 acre (i.e., the maximum impact that can be permitted through a Clean Water Act Section 404 Nationwide Permit 14), a Section 404 Individual Permit would be required, likely necessitating the consideration of reasonable avoidance measures to reduce the impacts to less than 0.5 acre. If an Individual Permit applies, the necessary analyses would be conducted as part of project permitting with the U.S. Army Corps of Engineers. Determination of permitting requirements would be based in part on whether a particular wetland would be affected by elevated or at-grade features. Although the analyses in this document conservatively assume all areas underneath the guideway to be affected, the wetland permit process may not necessarily consider these areas as temporary or permanent fill.

4.3.1 Long-Term Impacts

Direct long-term (i.e., permanent) impacts would occur where the project limits cross wetlands or buffers. The project limits include the guideway, station footprints (including parking), roadway improvements, storm drainage ponds, ancillary features, and analytical buffer (Section 1.4.1, Impact

Assessment). For this analysis, all impacts within these areas are considered long term. As explained in Section 1.4 (Assumptions), analyses in this document treat the construction of both at-grade and elevated guideways (including the area underneath) and other structures as long-term impacts on wetlands and other resources within the structure's footprint. However, based on factors such as the width and height of the elevated guideway, some of these areas may not experience long-term impacts. During the permitting phase, Sound Transit will re-evaluate these assumptions to provide a more detailed assessment of long-term impacts and identify detailed temporary construction limits to distinguish which wetlands and buffers could be restored.

Indirect long-term impacts might also occur due to construction and operation activities. Potential indirect long-term impacts for each project alternative include the following:

- Modification of wetland and wetland buffer vegetation (e.g., conversion of forest-dominated areas to shrub-dominated area due to vegetation maintenance intended to prevent trees and branches from interfering with operation of the light rail)
- Partial shading of wetlands and buffers from shadows cast beyond the elevated structure footprint
- Water quality degradation due to runoff from paved areas to surface waters or wetlands
- Alteration of wetland hydrology (disconnection, disruption, or change in water quantity)

Potential long-term impacts on wetlands and buffers for each segment and project alternative are summarized in Table 4-3 and shown on figures in Appendix D. Tables D-1, D-2, and D-3 in Appendix D present estimates of the area of individual wetlands and wetland buffers that would be subjected to long-term impacts each project alternative.

No Build Alternative

The No Build Alternative would not have any long-term impacts on wetlands or buffers in the study area. Conversely, implementing the No Build Alternative would not have potential beneficial environmental effects over the long term, such as implementing compensatory mitigation for impacts to wetlands, streams, and the regulatory buffers, or concentrating residential and commercial development in planned growth centers. Potential improvements in water quality would not be realized because stormwater runoff that would receive water quality treatment under the light rail alternatives would not receive water quality treatment under the No Build Alternative. Land development in areas away from such centers could cause degradation or loss of wetlands in outlying and rural areas.

Under the No Build Alternative, as well as all light rail alternatives, public agencies would continue current management practices within rights-of-way such as clearing for maintenance of vegetation and stormwater conveyance. Management activities would include periodic mowing, removal of dead or dying trees and tree limbs that could fall on the roadway, and clearing of brush that encroaches on the roadway. These activities would affect wetland vegetation and habitat by preventing trees and shrubs from becoming established in mowed areas, and preventing forested areas in the proposed right-of-way from developing natural features such as snags and downed wood.

Segment A: Seattle to Shoreline

The Preferred Alternative and all other light rail alternatives in Segment A are all located on the east side of I-5 from Northgate in Seattle to NE 185th Street in Shoreline, with the potential to affect seven wetlands totaling 0.9 acre (Table 4-3). Buffer impacts would range from 0.3 to 0.8 acre; the alternatives that include a station at NE 155th Street (Alternatives A5 and A7) would affect more wetland buffer area than the other alternatives. Impact quantities show slight variations based on the rail alignment and location of stations and detention ponds. Most affected wetland and buffer areas are within the WSDOT right-of-way; they are degraded, vegetated by invasive species, and disconnected from other habitats by roadways and development.

Table 4-3. Long-Term Impacts on Wetlands and Buffers by Project Alternative

Segment/Alternative	Wetland Area Affected (acres)	Wetland Buffer Area Affected[a] (acres)
Segment A: Seattle to Shoreline		
Preferred Alternative: At-grade/Elevated with NE 145th and NE 185th Street Stations A1: At-grade/Elevated with NE 145th and NE 185th Street Stations A3: Mostly Elevated with NE 145th and NE 185th Street Stations A10: At-grade/Elevated with NE 130th, NE 145th, and NE 185th Street Stations A11: Mostly Elevated with NE 130th, NE 145th, and NE 185th Street Stations	0.9[b]	0.3[b]
A5: At-grade/Elevated with NE 130th, NE 155th, and NE 185th Street Stations A7: Mostly Elevated with NE 130th, NE 155th, and NE 185th Street Stations	0.9[b]	0.8[b]
Segment B: Shoreline to Mountlake Terrace		
Preferred Alternative (B2 Modified): East Side to Mountlake Terrace Transit Center to West Side	0.8	1.6
Preferred Alternative (B2 Modified): East Side to Mountlake Terrace Transit Center to West Side with 220th Street SW Station option	0.5	1.6
B1: East Side to Mountlake Terrace Transit Center to Median	<0.1	0.9
B2A: East Side to Mountlake Terrace Transit Center to West Side with Optional 220th Street SW Station	1.6	1.3
B4: East Side to Mountlake Terrace Freeway Station to Median	0.2	0.7
Segment C: Mountlake Terrace to Lynnwood		
Preferred Alternative (C3 Modified): Along I-5 to Lynnwood Park-and-Ride Station	0.7	1.0
C1: 52nd Avenue West to 200th Street SW, Option 1 (Median) and Option 2 (West of I-5)	<0.1 / 0.2	0.7 / 1.1
C2: 52nd Avenue West to Lynnwood Transit Center, Option 1 (Median) and Option 2 (West of I-5)	0.9 / 1.1	0.6 / 1.1
C3: Along I-5 to Lynnwood Park-and-Ride, Option 1 (Median) and Option 2 (West of I-5)	0.2 / 0.3	1.0 / 1.7

[a] Wetland buffer impacts are based on local jurisdiction regulatory buffer widths (Seattle Municipal Code 25.09.160.C, Shoreline Municipal Code 20.80.330, Mountlake Terrace Municipal Code 16.15.090, and Lynnwood Municipal Code 17.10.051). Note that some impacts on wetlands and wetland buffers classified as long term would likely be temporary; see discussion in Section 1.4, Assumptions.

[b] The Seattle Municipal Code applies development restrictions and specifies mitigation requirements only within environmentally critical areas or buffers on publicly or privately held parcels. Five of the wetlands potentially affected by the proposed alignments (Wetlands WSE1, WSE3, WSE5, WSE6, and WSE7) are within the right- of- way for I-5 and are therefore not subject to City of Seattle buffer requirements. Actual wetland and wetland buffer impacts would be identified and mitigation requirements would be developed through local and other permitting processes.

Preferred Alternative: At-grade/Elevated with NE 145th and NE 185th Street Stations

The Preferred Alternative would result in 0.9 acre of wetland impact. Six wetlands would be considered a complete loss. The majority of each of these wetlands would be directly affected, leaving the remaining wetland area with altered hydrologic sources and/or reduced pre-project functions (although this could be considered an indirect impact, this analysis considers it likely to be concurrent with the project and therefore would be a direct impact). Four of these wetlands are located where the guideway is elevated (Wetlands WSE3, WSE5, WSE6, and WSH3), one occurs where the guideway is at-grade (Wetland WSH2), and one is at the NE 145th Street Station (Wetland WSH1). The NE 185th Street Station would not affect any wetlands. A portion of one potential wetland (PWSH4) would be affected by at-grade guideway.

The buffers of four wetlands (Wetlands WSE1, WSE4, WSE7, and WSE8) and one potential wetland (Wetland PWSH4) would be affected, totaling 0.3 acre[5]. Impacts to buffers of other wetlands mentioned above were not included in this calculation because those wetlands were considered to be complete losses. The guideway over the buffers of Wetlands WSE1, WSE4, WSE7, and WSE8 would be elevated, and the guideway would be at-grade through the buffer of Wetland PWSH4.

A1: At-grade/Elevated with NE 145th and NE 185th Street Stations

The wetland and wetland buffer impacts of Alternative A1 would be as described for the Preferred Alternative.

A3: Mostly Elevated with NE 145th and NE 185th Street Stations

The project limits and guideway alignment of Alternative A3 would be similar to the Preferred Alternative using the same station locations; however, most of the guideway would be elevated.

Alternative A3 would result in 0.9 acre of wetland impact. Similar to the Preferred Alternative, six wetlands would be considered a complete loss. Five of these wetlands are located where the guideway would be elevated (Wetlands WSE3, WSE5, WSE6, WSH2, and WSH3) and one (Wetland WSH1) is where the NE 145th Street Station and associated detention ponds would be located. The NE 185th Street Station would not affect any wetlands. A portion of one potential wetland (Wetland PWSH4) would be affected by the elevated guideway.

This alternative would affect the same wetland buffers as described for the Preferred Alternative. The amount of area affected in some individual buffers would differ slightly from that alternative (on the scale of 0.01 to 0.02 acre), but not enough to affect the total area of wetland buffer impacts. In contrast to the Preferred Alternative, the guideway would be elevated where it intersects all wetland buffers.

[5] The impacted buffers of Wetlands WSE1, WSE4, WSE7, and WSE8 (totaling 0.2 acre) are within road rights-of-way (i.e., not on publicly or privately owned parcels) in the city of Seattle and may not be subject to the City of Seattle Critical Areas Ordinance (Seattle Municipal Code 25.09).

A5: At-grade/Elevated with NE 130th, NE 155th, and NE 185th Street Stations

The alignment for Alternative A5 would be similar to that of the Preferred Alternative, but Alternative A5 would include stations at NE 130th Street and NE 155th Street instead of at NE 145th Street. Alternative A5 would result in 0.9 acre of wetland impact. Five wetlands would be considered a complete loss with four of these located where the guideway is elevated (Wetlands WSE3, WSE5, WSE6, and WSH3) and one where the guideway is at-grade (Wetland WSH2). The 130th Street, NE 155th Street, and NE 185th Street Stations would not affect any additional wetlands. Wetland WSH1 would not be a complete loss because no station is proposed at NE 145th Street. Only a small portion of the wetland would be crossed by elevated guideway. A portion of one potential wetland would be affected by elevated guideway (Wetland PWSH4).

This alternative (similar to Alternative A7) would affect buffers the most. The buffers of five wetlands (Wetlands WSE1, WSE4, WSE7, WSE8, and WSH1) and two potential wetlands (Wetlands PWSH4 and PWSH5) would be affected, totaling 0.8 acre[6]. The majority (0.6 acre) of buffer impacts would be associated with the elevated guideway. The other 0.2 acre of impacts would occur at the NE 155th Street Station.

A7: Mostly Elevated with NE 130th, NE 155th, and NE 185th Street Stations

Alternative A7 has a mostly elevated guideway similar to A3, but similar station choices as Alternative A5. As such, Alternative A7 would affect the same amount of wetland and wetland buffer area as Alternative A5, with impacts to the same wetlands and wetland buffers. In addition, as under Alternative A5, the only wetland affected by at-grade guideway would be Wetland WSH2.

A10: At-grade/Elevated with NE 130th, NE 145th, and NE 185th Street Stations

The project limits and guideway alignment of Alternative A10 would combine elements from Alternatives A1 and A5. Similar to those two alternatives, Alternative A10 would result in 0.9 acre of wetland impact. Six wetlands would be considered a complete loss with four of these located where the guideway is elevated (Wetlands WSE3, WSE5, WSE6, and WSH3), one where the guideway is at-grade (Wetland WSH2), and one at the NE 145th Street Station (Wetland WSH1). The NE 130th Street and NE 185th Street Stations would not affect any additional wetlands. A portion of one potential wetland would also be affected by elevated guideway (Wetland PWSH4).

This alternative would affect the same wetland buffers as described for the Preferred Alternative. The amount of area affected in some individual buffers would differ slightly from that alternative (on the scale of 0.01 to 0.02 acre), but not enough to affect the total area of wetland buffer impacts. In contrast to the Preferred Alternative, the guideway would be elevated where it intersects all wetland buffers.

A11: Mostly Elevated with NE 130th, NE 145th, and NE 185th Street Stations

The project limits and guideway alignment of Alternative A11 would be similar to A7 except that a station is proposed at NE 145th Street instead of at NE 155th Street (similar to Alternative A3).

Alternative A11 would result in 0.9 acre of wetland impact. Similar to the Preferred Alternative, six wetlands would be considered a complete loss. Five of these are located where the guideway would be elevated (Wetlands WSE3, WSE5, WSE6, WSH2, and WSH3) and one (Wetland WSH1) is where the NE 145th Street Station and associated detention ponds would be located. The NE 130th Street and NE 185th Street Stations would not affect any additional wetlands. A portion of one potential wetland would be affected by elevated guideway (Wetland PWSH4).

This alternative would affect the same wetland buffers as described for the Preferred Alternative. The amount of area affected in some individual buffers would differ slightly from that alternative (on the scale of 0.01 to 0.02 acre), but not enough to affect the total area of wetland buffer impacts. In contrast to the Preferred Alternative, the guideway would be elevated where it intersects all wetland buffers.

Segment B: Shoreline to Mountlake Terrace

Wetland impacts in Segment B would range from less than 0.1 acre (Alternative B1) to 1.6 acres (Alternative B2A). Buffer impacts would range from 0.7 acre (Alternative B4) to 1.6 acres (Preferred Alternative) (Table 4-3). All of the wetlands affected by the Segment B alternatives have relatively low quality ratings, based on habitat degradation, the presence of invasive species, and lack of connectivity with other wetlands.

Preferred Alternative (B2 Modified): East Side to Mountlake Terrace Transit Center to West Side with 220th Street SW Station option

The Preferred Alternative would result in 0.8 acre of wetland impact. Portions of four wetlands would be affected by elevated guideway (Wetlands WSH5, WMT5, WMT6, and WMT7). Reconstruction of the interchange ramps between I-5 southbound and 220th Street SW would result in the total loss of one wetland (WMT5). Implementation of the 220th Street SW Station Option under the Preferred Alternative would eliminate the need for reconstructing the interchange ramps between I-5 southbound and 220th Street SW, thereby avoiding Wetland WMT5 and reducing total wetland impacts to 0.5 acre (Table 4-3).

The buffers of eight wetlands (Wetlands WSH5, WMT1, WMT2, WMT3, WMT6, WMT7, WMT10, and WMT11) and one potential wetland (Wetland PWLY3) would be affected, totaling 1.6 acres. All buffer impacts would be associated with elevated guideway. In addition, a portion of the buffer associated with Wetland WMT3 would be affected by the construction of stairs associated with the Mountlake Terrace Transit Center Station.

B1: East Side to Mountlake Terrace Transit Center to Median

Among the Segment B alternatives, Alternative B1 would affect wetlands the least (less than 0.1 acre). Buffer impacts would total 0.9 acre. The elevated guideway would pass over a small portion of Wetland WSH5. The buffers of six wetlands (Wetlands WSH5, WMT1, WMT2, WMT3, WMT10, and WMT11) would be affected by elevated guideway and a portion of the buffer associated with Wetland WMT3 would be affected by the construction of stairs associated with the Mountlake Terrace Transit Center Station.

B2A: East Side to Mountlake Terrace Transit Center to West Side with Optional 220th Street SW Station

Alternative B2A would result in the greatest amount of wetland impacts among the Segment B alternatives (1.6 acres). Construction of the 220th Street SW Station, I-5 ramp relocations, and associated stormwater ponds would affect Wetlands WMT5 and WMT6 in their entirety. Similar to the Preferred Alternative, the Alternative B2A elevated guideway would also affect portions of Wetlands WSH5 and WMT7.

The buffers of seven wetlands (Wetlands WSH5, WMT1, WMT2, WMT3, WMT7, WMT10, and WMT11) and one potential wetland (Wetland PWLY3) would be affected, totaling 1.3 acres. All buffer impacts would be associated with elevated guideway. In addition, a portion of the buffer associated with Wetland WMT3 would be affected by the construction of stairs associated with the Mountlake Terrace Transit Center Station.

B4: East Side to Mountlake Terrace Freeway Station to Median

Alternative B4 would affect four wetlands (Wetlands WSH5, WMT1, WMT2, and WMT10), totaling 0.2 acre. Alternative B4 would affect a total of 0.7 acre of wetland buffers, associated with three of these four wetlands (Wetlands WSH5, WMT1, and WMT2). All wetland and buffer impacts would be associated with elevated guideway.

Segment C: Mountlake Terrace to Lynnwood

The Segment C alternatives include the Preferred Alternative and three other light rail alternatives. The Preferred Alternative would follow a route along the west side of I-5 before crossing over the Scriber Creek wetland complex to the Lynnwood Transit Center. Each of the other alternatives includes an option to start in the median (Option 1), or west of I-5 (Option 2), depending on the Segment B alternative. Wetland impacts range from less than 0.1 to 1.1 acres and buffer impacts range from 0.6 to 1.7 acres (Table 4-3). For each alternative, Option 1 would have less impact than Option 2 because Option 2 would affect a small (0.1 to 0.2 acre) portion of Wetland WLY3 that would not be affected by Option 1.

All Segment C wetland and buffer impacts are associated with elevated guideway. As a result, the amount of wetland and wetland buffer subject to long-term ground alteration would be less than reported in Table 4-3 because the alignment would be elevated through all areas where wetlands are present. The elevated guideway would span the smaller wetlands; in Wetland WLY4, only guideway support columns would be constructed in the wetland.

Preferred Alternative (C3 Modified): Along I-5 to Lynnwood Park-and-Ride Station

The Preferred Alternative would affect the wetland and buffer of three wetlands (Wetlands WLY3, WLY4, and WLY7), resulting in 0.7 acre of wetland impact and 1.0 acre of buffer impact. Most of the affected area would be associated with Wetlands WLY4 and WLY3.

C1: 52nd Avenue West to 200th Street SW

Among the light rail alternatives, Alternative C1 would affect the wetlands the least. Alternative C1 (Option 1) would result in less than 0.1 acre of impact to a single wetland (Wetland WLY4), affecting only a small area along the northern edge of the wetland complex. Alternative C1 (Option 1) would impact the buffers of two wetlands (Wetlands WLY3 and WLY4) and one potential wetland (Wetland PWLY5), for a total of 0.7 acre of buffer impact.

Alternative C1 (Option 2) would affect the same area of Wetland WLY4 as Option 1, and it would also affect approximately 0.1 acre of Wetland WLY3, totaling less than 0.2 acre of wetland impact. The buffers of these wetlands would be affected along with the buffers of Wetlands PWLY3 and PWLY5, resulting in 1.1 acre of wetland buffer impacts.

C2: 52nd Avenue West to Lynnwood Transit Center

Alternative C2 (both Options 1 and 2) would have the greatest wetland impacts among the Segment C alternatives, primarily because it would cross through the middle of Wetland WLY4. Similar to Alternative C1 (Option 1), Alternative C2 (Option 1) would affect only wetland (Wetland WLY4), resulting in 0.9 acre of wetland impact. Alternative C2 (Option 1) would impact the buffers of two wetlands (Wetlands WLY3 and WLY4), for a total of 0.6 acre of buffer impact.

Alternative C2 (Option 2) would affect the same area of Wetland WLY4 as Option 1, in addition to a small portion of Wetland WLY3, totaling 1.1 acres of impact. Buffers of these two wetlands along with the buffer of Wetland PWLY3 would be affected, resulting in 1.1 acre of wetland buffer impacts.

C3: Along I-5 to Lynnwood Park-and-Ride

Alternative C3 (Option 1) would affect one wetland (Wetland WLY4) and one potential wetland (Wetland PWLY1) resulting in 0.2 acre of wetland impact. Alternative C3 would cross a small portion along the southern edge of Wetland WLY4, affecting only slightly more area than Alternative C1. Alternative C3 (Option 1) would impact the buffers of three wetlands (Wetlands WLY4, WLY7, and WLY8) and one potential wetland (Wetland PWLY1), for a total of 1.0 acre of buffer impact.

Alternative C3 (Option 2) would affect the same areas of Wetlands WLY4 and PWLY1 as Option 1, in addition to a small portion of Wetland WLY3, totaling 0.3 acre of impact. Buffers of these three wetlands, along with the buffers of Wetlands WLY7, WLY8, and PWLY3 would be affected, resulting in 1.7 acres of wetland buffer impacts.

4.3.2 Construction Impacts

Similar to long-term impacts, construction-related impacts would occur where the project limits cross project limits cross wetlands or buffers. Construction impacts would be temporary, however, and would be limited to the period during and immediately following project construction. The construction period would last 6 years (from beginning of construction to beginning of operation). At most locations, ground-disturbing activities would be expected to last a year or two. Temporarily

disturbed sites would be replanted immediately following construction in each project segment, and vegetation would likely become reestablished within a year or two at most sites.

Wetlands could incur long-term temporary and short-term temporary impacts associated with construction:

- Long-term temporary impacts on wetlands occur when functions are affected in such a way that they can be restored to pre-impact performance, or will eventually be restored over time, but not within a year or so.
- Short-term temporary impacts last for a limited time, and functions return to pre-impact performance fairly soon (about 1 year or within one growing season of the impact).

The duration of construction impacts on emergent wetlands is generally short term while the impact duration on forested and scrub-shrub wetlands is typically long term. The amount of area that would be subject to long-term temporary versus short-term temporary impacts was not determined for this analysis because the boundaries of wetland vegetation types (emergent, scrub-shrub, and forested) have not yet been delineated. Such delineations would occur during the permitting phase of this project. It is assumed that areas temporarily affected during construction (access roads, staging areas, etc.) would be restored to pre-project conditions after construction.

Potential construction impacts include vegetation clearing and temporary site grading and filling for site access. Although detailed construction limits are not defined at this phase in the project design, potential construction limits have been estimated near streams, stream buffers, wetlands, and wetland buffers. Temporary impacts on wetlands and wetland buffers are summarized in Table 4-4. Tables D-4 and D-5 in Appendix D present estimates of the area of individual wetlands and wetland buffers that would be subjected to temporary, construction-related impacts under the project alternatives. In addition, some impacts on wetlands and wetland buffers that are categorized as long term would likely be temporary; see the discussion in Section 1.4, Assumptions. Construction impacts would be re-evaluated during the permitting phase.

Table 4-4. Construction Impacts on Wetlands and Buffers by Project Alternative

Segment/Alternative	Wetland Area Affected (acres)	Wetland Buffer Area Affected[a] (acres)
Segment A: Seattle to Shoreline		
All alternatives, including the Preferred Alternative[b]	0.0	0.0
Segment B: Shoreline to Mountlake Terrace		
Preferred Alternative	0.1	0.4
Preferred Alternative with 220th Street SW Station Option	0.1	0.4
B1: East Side to Mountlake Terrace Transit Center to Median	0.0	0.1
B2A: East Side to Mountlake Terrace Transit Center to West Side with Optional 220th Street SW Station	0.0	0.1
B4: East Side to Mountlake Terrace Freeway Station to Median	0.0	0.1

Table 4-4. Construction Impacts on Wetlands and Buffers by Project Alternative

Segment/Alternative	Wetland Area Affected (acres)	Wetland Buffer Area Affected[a] (acres)
Segment C: Mountlake Terrace to Lynnwood		
Preferred Alternative	0.3	0.2
C1: 52nd Avenue West to 200th Street SW, Option 1 (Median) and Option 2 (West of I-5)	0.0 / 0.0	<0.1 / <0.1
C2: 52nd Avenue West to Lynnwood Transit Center, Option 1 (Median) and Option 2 (West of I-5)	0.0 / <0.1	0.2 / 0.3
C3: Along I-5 to Lynnwood Park-and-Ride Option 1 (Median) and Option 2 (West of I-5)	0.0 / <0.1	<0.1 / 0.1

[a] Based on local jurisdiction regulatory buffer widths (Seattle Municipal Code 25.09.160.C, Shoreline Municipal Code 20.80.330, Mountlake Terrace Municipal Code 16.15.090, and Lynnwood Municipal Code 17.10.051).

[b] See Table 4-3 for permanent impacts, which include construction.

Temporary construction impacts could affect the functioning of wetlands within or adjacent to the construction limits for all light rail alternatives. Such impacts would be qualitative in nature and cannot be quantified. Potential adverse effects on wetlands and their functions would be minimized by the installation, monitoring, and maintenance of appropriate BMPs for the duration of construction. Wetland functions could be affected by soil compaction, accidental spills, noise and anthropogenic disturbance, potential increase of sediment input, and introduction of invasive species.

No Build Alternative

The No Build Alternative would not have any construction impacts on wetlands or buffers in the project vicinity. However, under the No Build Alternative as well as all light rail alternatives, public agencies would continue current management practices within rights-of-way such as clearing associated with maintenance of vegetation and stormwater conveyance (see long-term impacts discussion).

Segment A: Seattle to Shoreline

General construction limits beyond the project footprint were not identified for Segment A due to the alignment's location. It is assumed that because most of the alignment and associated features for the Segment A alternatives are situated on or adjacent to currently developed areas, no additional construction areas in wetlands or buffers would be required outside of the analytical buffer that was used to estimate long-term impacts. As noted in Section 1.4, Assumptions, not all areas within that analytical buffer would be subject to long-term impacts; some areas would be subject only to temporary impacts during construction. It was assumed for this analysis that the level of temporary construction impacts on vegetation would be commensurate with the level of long-term impacts. A similar assumption applies to impacts to wetlands and wetland buffers in Segment A. Based on that assumption, the construction-related effects of all Segment A alternatives, including the Preferred

Alternative, on wetlands would likely be the same, given that the long-term impacts would be the same for all six alternatives (Table 4-3). As for effects on wetland buffers, the long-term impacts of Alternatives A5 and A7 on buffers would be greater than those of the other alternatives, so the construction-related effects of those two alternatives would similarly be greater than those of the other alternatives. The impacts of the Preferred Alternative and Alternatives A1, A3, A10, and A11 on wetland buffers would all be similar (Table 4-3).

Segment B: Shoreline to Mountlake Terrace

The temporary, construction-related impacts of the Preferred Alternative on wetlands and wetland buffers would be greater than those of the other Segment B alternatives (Table 4-4). Alternatives B1, B2A, and B4 would all have no construction impacts on wetlands and similar acreages of construction impacts on buffers.

Segment C: Mountlake Terrace to Lynnwood

Alternative C1 would likely affect the wetlands the least during construction and the Preferred Alternative would have the most impact. This is due, in large part, to the construction of a temporary roadway or placement of fill in the wetland area for the alternative, which could increase the impacts beyond the levels assumed for the permanent facility. Options 1 and 2 for the Segment C alternatives would have similar construction-related impacts on wetlands and buffers.

To minimize the potential for impacts on ecosystem resources at the Scriber Creek wetland complex (Wetland WLY4) under the Preferred Alternative and Alternatives C2 and C3, temporary work trestles would be used for equipment access during construction of the elevated guideway across the wetland complex. The trestles would be supported by steel piles and would remain in position only as long as needed for the completion of projection construction. Any in-water work for trestle construction (including pile driving and pile removal) would be conducted in accordance with the terms of the HPA and other applicable permits obtained for the project.

4.4 Indirect and Secondary Impacts

Indirect and secondary impacts include those related to residential and commercial development near stations, or impacts on other resources from mitigation measures. Indirect impacts also include potential interference with possible future habitat restoration projects. For example, the presence of guideways, stations, or other facilities near streams could affect the potential replacement of existing fish passage barriers by limiting options for locations and types of fish-passable crossing structures.

Under any of the light rail alternatives, several factors would limit the potential for development near stations to adversely affect ecosystem resources. First, all proposed stations would be located in areas that are already densely developed. Second, any new development in these areas would be subject to review under local Critical Areas Ordinances, which would trigger the implementation of mitigation measures and practices aimed at avoiding or minimizing the potential for adverse effects on wetlands, aquatic species and habitat, and other natural resources such as fish and wildlife habitat conservation areas.

In most locations, the potential for construction of the light rail alternatives to interfere with possible future fish habitat restoration projects would be minimal because project features would be designed and located to avoid streams. Construction would occur above stream OHWMs and the guideways would be elevated at open stream crossings. As noted in Section 4.1.1, Long-Term Impacts, no culverts would be added or extended in any streams. Moreover, construction and operation of any of the light rail alternatives would not interfere with any anticipated culvert replacement projects in the I-5 right-of-way.

Exceptions could occur at two stream crossings. First, as discussed in Section 4.1.1, Long-Term Impacts, the construction of an elevated crossing of Scriber Creek under any of the light rail alternatives would entail the placement of support columns in areas that receive seasonal or intermittent flow. Based on the absence of human-made fish passage barriers within the wetland complex, however, it is unlikely that any fish passage improvement projects would be planned in that area.

The other location where construction of the light rail alternatives could interfere with possible future fish habitat restoration projects is at the crossing of Stream SMT1. The stream at this location is currently categorized as non-fish-bearing and is approximately 2,000 feet upstream of a culvert identified as a fish passage barrier in the I-5 right-of-way. . The alternatives that cross SMT1 (the Preferred Alternative and Alternatives B1 and B2A) would be elevated at this location. If the barrier culvert is removed and fish access to SMT1 is restored in the future, and if fish habitat improvement projects are subsequently planned for the stream reach crossed by the elevated guideway, it is possible that a guideway support column at this location could complicate the design of such habitat restoration projects. Such interference is unlikely to occur, however, because the stream channel at this location is poorly defined and the local topography offers ample opportunities for the creation of a channel that would avoid support columns or other structures..

During the permitting phase, Sound Transit will review available GIS data from local municipalities and identify culverts along documented and potential fish-bearing streams in the study area. That assessment will be used to further inventory locations where fish access improvement projects may occur in the future.

Actions taken to mitigate for impacts on other resources may have beneficial impacts on wetlands and aquatic species and habitats. For example, many jurisdictional wetlands in the study area are surrounded by heavily developed areas or are otherwise isolated from stream networks. Some mitigation measures for these wetlands could take the form of wetland habitat improvement or restoration in areas that contribute more directly to the functioning of stream systems, including those that support fish. To the extent that this occurs, such mitigation efforts could have a beneficial effect on aquatic species and habitats.

Additional long-term environmental benefits may result from the conversion of existing PGIS to non-PGIS (e.g., where elevated guideways intercept precipitation that would otherwise fall on high-traffic roadways). Such conversions would reduce the amount of untreated stormwater that drains from PGIS to watercourses in the study area, thereby decreasing pollutant loadings in receiving

waters. In addition, use of the Lynnwood Link Extension light rail system would be expected to reduce vehicle miles traveled by approximately 270,000 to 290,000 miles per day by 2035, with corresponding reductions in energy use, emissions, and related pollutants from vehicular traffic.

4.5 Cumulative Impacts

NEPA defines cumulative effects as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency (Federal or non-Federal) or person undertakes such other actions" (40 CFR 1508.7). Past actions and development have greatly changed the landscape in the study area and surrounding vicinity. Present and reasonably foreseeable future actions, including other transportation or infrastructure projects and other planned or pending land use actions or developments in the project vicinity could contribute to cumulative impacts on ecosystem resources in the study area. Impacts could include habitat loss, filling or clearing, altering hydrologic sources, or increasing pollutants and sedimentation in wetlands and streams. Not all reasonably foreseeable actions have the potential to result in adverse effects on the environment. For example, WSDOT and WDFW formed a cooperative program in 1991 to inventory and assess fish passage barriers on WSDOT facilities statewide. Culvert replacement and retrofitting projects through that program may improve fish access to streams in study area.

Several proposed site development projects could have some effect on ecosystem resources in the study area. These include a site in Mountlake Terrace, across 236th Street SW from the Mountlake Terrace Transit Center, that is envisioned by the City of Mountlake Terrace to accommodate higher-density development. The Edmonds School District master plan includes developing a bus base and administration center north of I-5 and east of 52nd Avenue West in Lynnwood. Construction of this facility could affect ecosystem resources such the Scriber Creek wetland complex. Sound Transit is considering a Link Operations and Maintenance Satellite Facility alternative in the same area, although a Bellevue site was identified as the Preferred Alternative. The Lynnwood site alternative would largely be built on previously developed parcels but a portion would extend into the Scriber Creek wetland complex. The impacts of these projects may include loss or degradation of vegetation, wildlife habitat, streams, wetlands, and associated buffer areas. These impacts would be both short term (e.g., temporary disturbance during construction) and long term (e.g., conversion of vegetated areas to impervious surface).

Future projects would generally have limited potential to adversely affect ecosystem resources. Any projects or land use actions would be subject to regulatory review and/or permitting under federal, state, and local regulations. The review and permitting processes would trigger implementation of measures to avoid or minimize impacts on ecosystem resources. Such processes would also result in compensatory mitigation for any unavoidable impacts to streams or stream buffers, wetlands, or wetland buffers. If combined with the effects of the Lynnwood Link Extension, there would be higher cumulative effects on ecosystem resources than if the impacts of each project were considered on its own. However, if avoidance and mitigation measures such as those described

below are applied for all projects, the effects would be reduced. Coordination among the project proponents could also help reduce impacts.

4.6 Potential Mitigation Measures

Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts on environmentally sensitive resources as much as possible, and to provide adequate mitigation for unavoidable impacts to ensure no net loss of ecosystem function and acreage as a result of agency projects. The Lynnwood Link Extension would mitigate impacts on ecosystem resources in accordance with the mitigation sequencing requirements established by NEPA, the CWA, and local Critical Areas Ordinances.

According to NEPA (40 Code of Federal Regulations [CFR] paragraphs 1508.20), the sequence of mitigation is as follows:

a) Avoiding the impact altogether by not taking a certain action or parts of an action

b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation

c) Rectifying the impact by repairing, rehabilitating, or restoring the affected environment

d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action

e) Compensating for the impact by replacing or providing substitute resources or environments

Avoidance and Minimization

The avoidance and minimization of impacts was a guiding principle in the preliminary design of project alternatives; further avoidance and minimization measures would continue to be pursued as the project enters final design and permitting stages. Under any of the light rail alternatives, Sound Transit would comply with standard specifications, BMPs, and applicable federal, state, and local mitigation requirements during design, construction, and post-construction activities. A summary of BMPs that would be implemented to avoid and minimize impacts on ecosystem resources is provided in Appendix A.

Restoration of Construction Impacts

Immediately following construction in each project segment, Sound Transit would begin restoring temporarily disturbed wetlands, streams (if any work occurs below the OHWM of any streams), and buffer areas. The length of time that would be required for site restoration to effectively replace habitat functions would vary. Temporarily disturbed wetlands, streams, and their buffers would be restored to pre-construction conditions where feasible and planted with appropriate native species when construction activities are finished.

Compensatory Mitigation

For any wetland, stream, and buffer impacts that could not be avoided or adequately minimized, Sound Transit would replace the area and functions lost through compensatory mitigation. As appropriate, Sound Transit would apply the federal Final Compensatory Mitigation Rule (40 CFR Part 230); appropriate current available agency regulations; guidelines established jointly by Ecology, the U.S. Army Corps of Engineers, and U.S. Environmental Protection Agency in *Wetland Mitigation in Washington State* (Ecology et al. 2006); and local Critical Areas Ordinances for the cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood.

Mitigation for unavoidable impacts to streams, stream buffers, and wildlife habitat would be provided in accordance with the requirements of local critical areas ordinances. In general, those ordinances state that mitigation should prevent the net loss of ecological function; the means of achieving that goal are determined through individual permitting processes. Sound Transit's actions to mitigate for impacts on wetlands and wetland buffers (e.g., planting native trees and shrubs near wetland areas) would help offset the loss of some habitat for wildlife and contribute to improved ecological function of nearby streams and stream buffers. Tree planting required for compliance with WSDOT's and local jurisdictions' tree protection rules would also help mitigate impacts to streams, stream buffers, and wildlife habitat. Lastly, planting of trees and shrubs to mitigate visual impacts (including in replacement lands for affected WSDOT beautification areas along I-5) would also provide ecological benefits.

Sound Transit has committed to achieving no net loss of ecosystem function and acreage on a project-wide basis. This includes a commitment to no net loss of wetland functions and wetland areas. Long-term impacts on wetlands and buffers could be mitigated by one or more of the following approaches:

- Approved mitigation bank
- King County in-lieu fee program
- Project-specific mitigation developed by Sound Transit

Also, Sound Transit would consider opportunities to establish mitigation in advance of the impacts from future construction of the Lynnwood Link Extension.

Approved Mitigation Bank

Currently, there are no existing approved mitigation banks in the project area basins. Although it is possible that a bank could become certified with service in the project area in the future, mitigation banking projects take considerable lead time for planning and approval.

King County In-Lieu Fee Program (Mitigation Reserves Program)

King County has developed an in-lieu fee program called the Mitigation Reserves Program, which was approved by the U.S. Army Corps of Engineers in March 2012 (King County 2012). The program includes service areas within King County for the Thornton Creek basin and McAleer Creek basin in the Cedar River/Lake Washington watershed. Sound Transit would discuss this

program with the Cities of Seattle and Shoreline to determine whether this program could be applicable to the Lynnwood Link Extension.

Project-specific Mitigation Developed by Sound Transit

Both the *Wetland Mitigation in Washington State* guidance and local codes require that wetland mitigation be completed at specific replacement ratios relative to the category of the wetland affected and the type of mitigation proposed (i.e., wetland creation, restoration, enhancement, or preservation) (Tables 4-5 through 4-9). These replacement ratios are guidelines from which case-by-case consideration start. To determine the appropriate mitigation ratios for this project, the project team may propose adjustments to these guidelines to consider unique project circumstances.

Table 4-5. Recommended Wetland Mitigation Ratios for Projects in Western Washington [a]

Category of Wetland Impacts	Re-establishment or Creation	Rehabilitation Only	Re-establishment or Creation (R/C) and Rehabilitation (RH)	Re-establishment or Creation (R/C) and Enhancement (E)	Enhancement Only
Category II	3:1	6:1	1:1 R/C and 4:1 RH	1:1 R/C and 8:1 E	12:1
Category III	2:1	4:1	1:1 R/C and 2:1 RH	1:1 R/C and 4:1 E	8:1
Category IV	1.5:1	3:1	1:1 R/C and 1:1 RH	1:1 R/C and 2:1 E	6:1

[a] Ecology et al. (2006)

Table 4-6. City of Seattle Wetland Mitigation Ratios[a]

Category III	2:1	-
Category IV	1.5:1	-

[a] Lynnwood Municipal Code 17.10.055
[b] Ratios not specified for enhancement

Compensatory mitigation would also be provided for long-term temporary impacts and conversion of wetlands from one type to another (e.g., forested wetland to emergent or scrub-shrub wetland). Generally, compensation for long-term temporary impacts is one-quarter of the typical ratios for long-term (permanent) impacts and one-half for conversion of wetlands. Impacts on buffers would generally be replaced at a minimum ratio of 1:1 using buffer enhancement.

The mitigation approach to compensate for unavoidable impacts caused by the project may consist of on-site mitigation, off-site mitigation, or a combination of the two. Opportunities for wetland mitigation occur in the study area and within the greater project vicinity.

In cooperation with resource agencies, Sound Transit would develop plans to mitigate the effects of the project on wetlands and buffers. Site selection would emphasize a watershed approach. To the extent possible, compensatory mitigation sites would be identified and compensate for lost values in-kind. It is environmentally and economically desirable to maximize the ecological functions at sites by consolidating as many mitigation requirements as possible at the least number of mitigation sites. It may be necessary to use several sites and approaches to mitigation given the size of this light rail project, the variety of impacts, complexity of identifying mitigation opportunities, and satisfying mitigation requirements.

Potential project-specific mitigation sites would be selected according to the federal Final Compensatory Mitigation Rule (40 CFR Part 230) and joint guidance developed by Ecology, the U.S. Army Corps of Engineers, and the U.S. Environmental Protection Agency (Hruby et al. 2009), which discuss the implementation of a watershed approach to selecting mitigation sites. This approach allows for a greater degree of flexibility in selecting mitigation sites and potentially greater value created for the watershed than the previous regulatory focus on on-site mitigation. Potential sites currently under consideration for project-specific mitigation for impacts on wetlands and wetland buffers are described below.

North Seattle Community College Campus

Various opportunities for wetland restoration and enhancement may be present on the North Seattle Community College Campus, although other projects proposed in the vicinity may reduce the area available.

Jackson Park Golf Course/5th Avenue NE

Potential wetland and riparian mitigation could be accomplished along the east side of the 5th Avenue NE right-of-way and the Jackson Park Golf Course, particularly along Thornton Creek.

NE 145th Street Vicinity

Two potentially available parcels near Paramount Park in Shoreline may provide opportunities for wetland protection and restoration.

NE 155th Street Station Vicinity

Wetland creation may be possible south of the NE 155th Street Station (proposed under Alternatives A5 and A7) near the locations of Wetlands PWSH4 and PWSH5.

Ballinger Lake Golf Course

The City of Mountlake Terrace will be transitioning the Ballinger Lake Golf Course to a passive park/open space, which could create wetland restoration opportunities.

Scriber Creek Wetland Complex (Wetland WLY4)

Wetland and stream mitigation opportunities are present in the Scriber Creek vicinity near the Lynnwood Transit Center. These parcels are under both public and private ownership, including parcels that could be acquired by Sound Transit because they intersect with areas needed for the light rail right-of-way. A private parcel on Cedar Valley Road, along the western edge of the wetland complex, could also provide an opportunity for mitigation. These mitigation opportunities may include wetland creation, restoration, or enhancement.

APPENDIX A

Best Management Practices for Ecosystem Resources

APPENDIX A – BEST MANAGEMENT PRACTICES FOR ECOSYSTEM RESOURCES

This description of measures is a compilation of best management practices (BMPs) that can be used to avoid and minimize temporary construction and long-term impacts of the Lynnwood Link Extension on sensitive ecosystem resources. These BMPs are either required by state or federal agencies to obtain permits required for the project or may be required to comply with typical permit conditions. They are based on Sound Transit's knowledge of permit requirements and experience with conducting environmental compliance and permitting for numerous other projects in the Puget Sound area.

Construction Best Management Practices

General Best Management Practices for All Sensitive Areas

Sound Transit's construction contractor would implement construction BMPs that would apply to all work in or around sensitive areas. The construction contractor would work within construction limits marked with fencing and signage to prevent unintended impacts on riparian vegetation, wetlands, woodlands, and other sensitive sites outside of the construction limits. The construction limits would be clearly marked with high-visibility construction fencing and signage prior to any ground-disturbing or construction-related activities. There would be no direct site disturbance outside of the construction limits.

Soil or rock stockpiles, excavated materials, or excess soil materials would be prevented from eroding into sensitive habitats, including stream channels, wetlands, and riparian areas outside of the construction limits by high water or storm runoff. Before discharging or allowing runoff from the project site, the construction contractor would be required to develop, implement, and monitor a Temporary Erosion and Sediment Control (TESC) plan to address potential erosion for the duration of construction. The contractor would implement the plan before discharging or allowing runoff from the site. Monitoring requirements specified in the TESC would provide feedback to ensure that the erosion control practices are operating properly and effectively. BMPs would limit soil compaction in sensitive areas. For example, tracked equipment rather than tire-based equipment may be used in areas that are sensitive to adverse effects from soil compaction. Temporary work trestles or other measures that minimize impacts would be used where practical, such as the Scriber Creek wetland complex.

Other measures to reduce the risk of erosion and sedimentation may include the following:

- Installing erosion control blankets or an equally effective BMP on steep slopes that are susceptible to erosion and where ground-disturbing activities have occurred, in order to prevent erosion and assist with establishment of native vegetation.
- Covering material temporarily stored for use in project activities with plastic or other impervious material during rain events to prevent sediments from being washed from the storage area to surface waters

- Inspecting temporary and permanent erosion and sedimentation control measures on a regular basis and maintaining and repairing the measures to ensure continued performance of their intended function
- Inspecting silt fences after each rainfall, and at least daily during periods of prolonged rainfall.

Fish and Aquatic Habitat Protection

All work below the OHWM of streams in the study area would comply with the terms and conditions set forth in the Hydraulic Project Approval (HPA) issued for the project by the Washington Department of Fish and Wildlife (WDFW). The HPA program is the vehicle through which WDFW regulates activities that affect the bed or flow of waters of the state for the protection of fish life. An HPA is required for construction or structural work associated with any bridge structure or culvert construction within or below the ordinary high water mark (OHWM) of waters of the state. HPAs typically specify provisions designed to avoid or minimize the potential for adverse effects on habitat in receiving waters. Provisions required for the Lynnwood Link Extension could include restrictions on construction periods below the OHWM and/or other measures designed to avoid or minimize the potential for construction activities to deliver sediment or pollutants to streams.

In accordance with typical requirements of an HPA, when large woody debris must be moved to allow the reasonable use of an over-water or in-water facility, the large woody debris would be returned to the water downstream, where it would continue to provide aquatic habitat function. To reduce the risk of adverse effects on migrating salmonids during project construction, Sound Transit would require construction contractors to direct lighting away from fish-bearing waters and to place hoods or shields on lights, as needed, to minimize the amount of backlight or dispersed light cast toward the water's surface.

Any affected streambeds and stream banks would be permanently restored after in-water work with plantings of native or approved woody and herbaceous species within 1 year of completion of each phase of construction. Bank protection would follow the guidelines set forth in WDFW's *Integrated Streambank Protection Guidelines* (http://wdfw.wa.gov/hab/ahg/ispgdoc.htm).

Water Quality Protection

The federal Clean Water Act (CWA) established water quality goals for the navigable (surface) waters of the United States. One of the mechanisms for achieving the goals of the CWA is the National Pollutant Discharge Elimination System (NPDES) permit program, which is administered by the U.S. Environmental Protection Agency (EPA). EPA has delegated responsibility to administer the NPDES permit program to the State of Washington on the basis of Chapter 90.48 of the Revised Code of Washington, which defines the authority and obligations of the Washington State Department of Ecology (Ecology) in administering the wastewater discharge permit program. The project would obtain and adhere to a NPDES construction stormwater general permit to reduce or eliminate stormwater pollution and other impacts on surface waters. The construction contractor

would be required to adhere to water quality standards as stated in the 401 Water Quality Certificate and NPDES permit issued for the project.

Ecology's construction stormwater general permit is required for certain construction activities. The goal of the permit program is to reduce or eliminate stormwater pollution and other impacts on surface waters.

The project must complete a Notice of Intent (NOI) for coverage under the permit. A construction stormwater pollution prevention plan, approved by Ecology, would also be implemented before the start of construction. The plan would include BMPs to (1) prevent erosion; (2) prevent sedimentation; and (3) identify, reduce, eliminate, or prevent stormwater contamination and water pollution from construction activity. The Construction Stormwater Pollution Prevention Plan would include a TESC plan that includes BMPs such as silt fences; protective ground covers, such as straw, plastic sheeting, or jute mats; straw bales in drainage features; a Spill Prevention, Control, and Countermeasures Plan; a Concrete Containment and Disposal Plan; Dewatering Plan; and a Fugitive Dust Plan.

Turbid water produced (including untreated water from dewatering activities) would be prevented from discharging to fish-bearing waters or wetlands. Turbid wastewater may be routed to temporary or permanent detention facilities, or to upland areas that provide adequate rates of infiltration.

In accordance with conditions of a typical HPA, heavy equipment used during the course of in-water work would operate from above the OHWM wherever possible. Use of equipment below the OHWM would be limited to that necessary to gain position for work. Drive mechanisms would not enter or operate below the OHWM, except under the terms of the HPA issued by WDFW. Work areas below the OHWM would be isolated from other surface waters with a coffer dam or similar system to prevent suspended sediment or pollutants from leaving the work area.

Uncured concrete and/or concrete byproducts would be prevented from coming in contact with streams or water conveyed directly to streams during construction. A concrete truck chute cleanout area or equally effective BMP would be established to properly contain wet concrete. Any water having direct contact with uncured concrete would be contained and treated or removed from the site (as appropriate) to prevent discharge to streams or wetlands.

If any permanent footings or drilled or pile-driven shafts are installed below the OHWM, installation would be conducted in a manner consistent with Section 404 and other permits issued for the project by the Corps and other parties (as applicable). When constructing drilled shafts, the contractor would ensure that all drilling equipment, drill recovery and recycling pits, and any waste or spoil produced are properly contained to prevent discharge of drill wastes or fluids to any surface water or wetlands.

Equipment (excluding track-mounted equipment, large cranes, and other relatively immobile equipment) would be refueled and maintenance activities conducted at a distance from the nearest wetlands, ditches, and flowing or standing water approved by regulatory permits. Appropriate spill prevention measures and fuel containment systems would be designed and implemented to completely contain a potential spill as specified in the Spill Prevention, Control, and

Countermeasures Plan. As appropriate, equipment used for construction activities would be cleaned before arriving at the project site to ensure no potentially hazardous materials are exposed, no leaks are present, and the equipment is functioning properly. Wash water would not be discharged directly into any water body without pretreatment. Construction equipment and vehicles would be maintained to prevent them from leaking fuel or lubricants. Should a leak be detected on heavy equipment used for the project, the equipment would be repaired before use.

Vegetation and Wildlife Protection

The measures listed below would be implemented before and during project construction to avoid or minimize effects on vegetation and wildlife resources. These measures would be implemented along with others designed to avoid or minimize effects on other resources, such as streams, wetlands, and soils. The additional measures would be expected to provide more protection to vegetation and wildlife resources within and adjacent to streams and wetlands.

- Limit construction activity to a relatively small area immediately adjacent to the existing cleared area to minimize vegetation clearing and leave as much vegetation undisturbed as possible.
- As appropriate, restore areas temporarily affected by construction to pre-construction conditions or better through replanting or reseeding.
- Prepare and implement a revegetation plan that emphasizes the use of native species as appropriate.
- In accordance with the Migratory Bird Treaty Act, consult with USFWS on methods to implement during construction to avoid impacts on migratory birds. Such methods could include conducting pre-construction surveys for migratory birds and/or placing restrictions on vegetation clearing during the breeding season for migratory birds.
- To minimize the extent of habitat disturbance associated with the removal of potential hazard trees, Sound Transit would identify and remove such trees on an individual basis, based on tree species, tree health, and distance from the alignment.

In addition to the measures identified above, a monitoring plan and adaptive management plan would be implemented, as directed by permit requirements, for revegetated sensitive areas or buffers. The plans would generally require verification of 100 percent survival of all installed native trees and shrubs 1 year after installation. The performance criteria would be met if all dead plants are replaced at the end of the first year. Native woody species (planted and volunteer) must generally maintain a density of four plants per 100 square feet in each plant community by the end of the 3-year period. Plant communities would be identified in the mitigation plan.

Control of Noxious and Invasive Species

The most effective means of reducing the introduction and spread of noxious and invasive species are weed control and restoration of disturbed construction sites with native plant species suitable for the type of site disturbed. Weed control is important before and during construction. Per federal,

state, and local requirements and guidance, Sound Transit would implement appropriate measures to minimize risk of introduction and spread of noxious and invasive species, including restoring temporarily disturbed areas immediately following construction in each project segment. To minimize use of herbicides and fertilizers, restoration of disturbed areas would include the use of mulching, ground cover, and other planting strategies that discourage growth of undesirable species.

Design and Operation Best Management Practices

The project would install permanent stormwater runoff treatment and flow control facilities where needed to comply with Sound Transit's *Design Criteria Manual* (Sound Transit 2012).

The project would incorporate stormwater conveyance and flow control facilities that promote infiltration where applicable and permittable.

The project would select, design, and install runoff treatment BMPs that are best suited to the site conditions and best capable of achieving the required levels of treatment (subject to negotiation with the local jurisdiction and/or Ecology). These could include natural or engineered dispersion BMPs; biofiltration BMPs such as vegetated filter strips, biofiltration swales, or ecology embankments; wet-pool BMPs; and infiltration BMPs.

The project would route drainage to maintain existing stream basin contributing areas.

Sound Transit would coordinate with WSDOT, local jurisdictions, and resource agencies conducting restoration projects in the area to minimize the potential for light rail facilities to interfere with future restoration projects.

Except in cases where hazard trees pose an immediate threat to light rail safety or reliability, vegetation maintenance and hazard tree removal would be conducted outside of the breeding season for migratory birds.

The project would implement pesticide application techniques, in accordance with current Ecology water quality agreements, to minimize the impact on aquatic and terrestrial environments.

1 INTRODUCTION

1.1 Project Overview

The proposed Lynnwood Link Extension would begin at Northgate in north Seattle and end at the Lynnwood Transit Center. The 8.5-mile project corridor generally follows Interstate 5 (I-5), the major north-south freeway through the state, and the primary route serving a large commuter market traveling between Snohomish and King counties. The corridor travels through the cities of Seattle and Shoreline in King County and Mountlake Terrace and Lynnwood in Snohomish County. The project area lies between Puget Sound to the west and Lake Washington to the east.

The Lynnwood Link Extension alternatives would extend light rail from the planned northern terminus of the Link light rail system at Northgate, continuing north along I-5 to Lynnwood. In 2010, the Central Puget Sound Regional Transit Authority (Sound Transit) started a project-level planning process and developed a set of alternatives that were studied in a Draft Environmental Impact Statement (EIS) (Sound Transit and Federal Transit Administration 2013). Through that analysis process, Sound Transit identified a Preferred Alternative, which is evaluated in this document and in the Final EIS.

1.2 Purpose of Report

This wetland and stream delineation report was prepared to describe the wetlands and streams within the Lynnwood Link Extension corridor to support the National Environmental Policy Act (NEPA) review process. This report will help facilitate agency review by providing detailed descriptions of study area wetlands and streams, including classifications, ratings, and buffers. Wetland and stream data gathered were used to assist the design of the project alternatives and would serve as the basis for determining and mitigating the impacts of the Preferred Alternative or any of the other light rail alternatives.

1.3 Study Area

The study area for this report encompasses the area within 200 feet of either side of the project alternatives or features. Wetlands and streams described in this report include those that fall entirely or partly within the study area. To encompass the maximum possible extent of water quality mixing zones set by the Washington State Department of Ecology (Ecology), the study area also includes stream segments extending up to 100 feet upstream and 300 feet downstream of locations where the project boundaries cross streams (Washington Administrative Code [WAC] 73-201A-400).

2 METHODS

The process of identifying and describing wetlands and streams in the study area involved agency coordination and review of existing information, as well as on-site field surveys. The following subsections describe the methods used for gathering existing information and field data.

2.1 Data Gathered

Sound Transit conducted a review of existing literature and data to identify and characterize potentially affected wetlands and streams in and near the study area. Existing documentation and information were compiled and reviewed first so that the field survey efforts could focus on verifying data and filling information gaps. This information included published and unpublished reports, maps, Web sites, aerial photographs, and communication with local municipality staff familiar with wetlands and streams within the project vicinity. In addition, state and local regulations and guidance were reviewed to assist in identifying stream types and to confirm project compliance with existing laws. The data sources are listed below.

2.1.1 Agency Coordination

Sound Transit contacted the following agencies and local jurisdictions:

- Washington State Department of Transportation (WSDOT)
- Ecology
- City of Seattle
- City of Shoreline
- City of Mountlake Terrace
- City of Lynnwood

2.1.2 Maps and Existing Documentation

Sound Transit reviewed the following resources:

- National Wetlands Inventory (NWI) data (U.S. Fish and Wildlife Service [USFWS])
- Natural Resources Conservation Service (NRCS) Soil Survey maps
- Priority Habitats and Species (PHS) data (Washington Department of Fish and Wildlife [WDFW])
- SalmonScape fish data and maps (WDFW)
- StreamNet data and maps (StreamNet 2012)
- City of Seattle *State of the Waters 2007* report (City of Seattle 2007)
- Basin characterization reports of Thornton Creek and West Lake Washington (Tetra Tech/KCM 2004a) and McAleer Creek and Lyon Creek (Tetra Tech/KCM 2004b)

- Stream habitat analysis for the City of Lynnwood (Jones and Stokes 2000)
- *Swamp Creek Drainage Needs Report*, including Scriber Creek Subbasin (Snohomish County 2002)
- *Salmon and Steelhead Habitat Limiting Factors Report for the Cedar-Sammamish Basin* (Kerwin 2001)
- Washington State Department of Natural Resources (DNR) Natural Heritage Program database
- *A Catalog of Washington Streams and Salmon Utilization, Volume 1, Puget Sound Region* (Williams et al. 1975)
- Critical area maps from local jurisdictions (Cities of Seattle, Shoreline, Mountlake Terrace, Lynnwood, King County, and Snohomish County)
- Existing digital geographic information system (GIS) data from the Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood.
- *Sound Transit 2 Mitigation: Impact Summary and Analysis Memorandum* (ESA Adolfson 2010) and associated GIS data
- Aerial photography of the project corridor (including the King County aerial photography database or Google Earth database)
- Regulatory compliance documents, such as the *North Link Light Rail Transit Project Final Supplemental Environmental Impact Statement* (Sound Transit 2006), critical area studies, wetland delineation reports, and stream studies by other agencies or consulting firms, as available

2.2 Field Surveys

Following the review of existing documentation and information, Sound Transit conducted detailed field surveys to identify wetlands and streams that could be affected by any of the project alternatives. Surveys were conducted in two phases. During the Draft EIS phase, surveys were conducted to identify, map, and describe wetlands and streams within the field reconnaissance survey area, defined as public rights-of-way within the study area administered by the WSDOT or other public agencies. In preparation for the field reconnaissance surveys, a set of maps was developed showing data from local jurisdiction critical area maps, the NWI, and the *Sound Transit 2 Mitigation: Impact Summary and Analysis Memorandum* (ESA Adolfson 2010). Existing data and the study area boundary were overlain on aerial photographs at a scale of 1:24,000 (1 inch = 200 feet). Field reconnaissance surveys were performed between March 9 and July 23, 2012 (Attachment A) but wetland boundary delineations were not conducted during this phase. Instead, wetland boundaries were estimated in the field and mapped using a global positioning system (GPS); GPS data were then incorporated into the project GIS. Additional information about field reconnaissance surveys is provided in the *Lynnwood Link Extension Wetland Identification and Survey Technical Report* prepared for the Draft EIS (Sound Transit 2013).

During the Final EIS phase, wetland delineations and delineations of stream ordinary high water mark (OHWM) were performed in all properties for which rights of entry could be obtained along the Preferred Alternative alignment (approximately 100 feet on each side beyond the construction

limits for the Preferred Alternative; this area is referred to as the delineation survey area in this report). Some wetlands could not be accessed because right of entry was not granted. Delineation surveys were conducted between July 2013 and July 2014 (Attachment A). The purpose of the delineation surveys was to refine resource boundaries and update information for the Final EIS. Data from the delineation surveys were used to amend the data collected during the 2012 field reconnaissance surveys.

Wetlands, streams, and portions of these features where rights of entry could not be obtained within the study area were identified based on visual observation from public areas during field surveys; current local, state, and federal wetland maps; critical area reports; and aerial photographs. These features were identified as potential wetlands or potential streams and incorporated into the GIS database. Ground-truthing and field data collection were not conducted on properties where no rights of entry could be obtained.

Photographs of wetlands visited during the field reconnaissance or delineation surveys are presented in Attachment B.

2.3 Wetland Identification and Classification

2.3.1 Wetland Identification

Vegetation, soil, and hydrology conditions within the field reconnaissance and delineation survey areas were documented as necessary at representative locations (sample plots) using methods outlined in the U.S. Army Corps of Engineers (Corps) *Wetland Delineation Manual* (Corps 1987) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region Version 2.0* (Corps 2010). These sample plots were identified in the field with labeled flagging and locations were recorded with a GPS unit or professional survey equipment. Both wetland and upland sample plots were documented. Wetland determination data forms were developed for all wetlands within the WSDOT, other public rights-of-way, and on properties where rights of entry were obtained. Observations of existing conditions and characteristics were recorded for each wetland and associated buffer. Data were collected at representative sample plots within each USFWS class, with a paired upland sample plot (except for Wetland WSE6 where the adjacent upland consisted of roadway and compacted fill).

During the reconnaissance phase for the Draft EIS, wetland boundaries were estimated and mapped using GPS. Wetlands that extend beyond the field reconnaissance survey area and other potential wetlands outside of the WSDOT or other public rights-of-way were also incorporated into the GIS database for analysis in the EIS. These wetland boundaries were added to the project GIS database by adding existing GIS layers or estimating and digitizing boundaries.

During the delineation phase for the Preferred Alternative, project biologists flagged wetland boundaries within the delineation survey area where rights of entry were obtained, which professional land surveyors then surveyed. Within portions of the field reconnaissance areas outside of the delineation area, boundaries were estimated and mapped using GPS. All wetlands on

properties where rights of entry were obtained within 100 feet of the Preferred Alternative were delineated and rated to support permitting with federal, state, and local agencies.

Each wetland identified in the study area received a unique identifier that is tracked in the project GIS database. Wetlands were named based on whether they were field-identified wetlands (W) or not field-identified/potential wetlands (PW); the city in which they are located (Seattle = SE, Shoreline = SH, Mountlake Terrace = MT, Lynnwood = LY); and the order they were encountered in the field (1, 2, 3, etc.). For example, Wetland WSE2 is the second field-identified wetland in Seattle. The field reconnaissance was conducted generally from south to north through the study area.

2.3.1.1 Hydrology

The project area was examined for evidence of hydrology. An area is considered to have wetland hydrology when soils are ponded or saturated consecutively 12.5 percent of the growing season. In King County (Seattle and Shoreline), the growing season generally lasts from the beginning of February (February 7) to the beginning of December (December 8) for a total of 304 days (USDA NRCS 2012a), so ponding or saturation must be present for approximately 38 consecutive days. Primary indicators of hydrology include surface inundation and saturated soils. Secondary indicators of hydrology include drainage patterns, watermarks on vegetation, water-stained leaves, and oxidized root channels.

2.3.1.2 Soils

Generally, an area must have hydric soils to be considered a wetland. Hydric soil forms when soils are saturated, flooded, or ponded long enough during the growing season to develop anaerobic conditions in the upper portion. Biological activities in saturated soil result in reduced concentrations of oxygen that in turn result in a preponderance of organisms that use anaerobic processes for metabolism. Over time, anaerobic biological processes result in certain soil color patterns, which are used as indicators of hydric soil. Typically, low-chroma colors are formed in the matrix of hydric soil. Bright-colored redoximorphic features form within the matrix under a fluctuating water table. Other important hydric soil indicators include organic matter accumulations in the surface horizon, reduced sulfur odors, and organic-matter staining in the subsurface. Soils were examined by excavating sample pits to a depth of 18 inches or more to observe the soil profiles, colors, and textures. Munsell color charts (Gretag Macbeth 2000) were used to describe the soil colors.

2.3.1.3 Vegetation

The dominant plants and their wetland indicator status were evaluated to determine whether the vegetation is hydrophytic. Hydrophytic vegetation is generally defined as vegetation adapted to prolonged saturated soil conditions. To meet the hydrophytic vegetation criterion, more than 50 percent of the dominant plants must be facultative, facultative wetland, or obligate, according to the plant indicator status category assigned to each plant species by the USFWS (Reed 1988, 1993). Table 2-1 provides the definitions of the indicator status categories for identifying the plant species.

Table 2-1. Key to Plant Indicator Status Categories

Plant Indicator Status Category	Symbol	Definition
Obligate Wetland Plants	OBL	Plants that almost always (>99% of the time) occur in wetlands but may rarely (<1% of the time) occur in non-wetlands
Facultative Wetland Plants	FACW	Plants that often (67% to 99% of the time) occur in wetlands but sometimes (1% to 33% of the time) occur in non-wetlands
Facultative Plants	FAC	Plants with a similar likelihood (33% to 66% of the time) of occurring in both wetlands and non-wetlands
Facultative Upland Plants	FACU	Plants that sometimes (1% to 33% of the time) occur in wetlands but occur more often (67% to 99% of the time) in non-wetlands
Upland Plants	UPL	Plants that rarely (<1% of the time) occur in wetlands and almost always (> 99% of the time) occur in non-wetlands

Source: Corps (1987).

The scientific and common names for plants follow the currently accepted nomenclature. Most of the names are consistent with *Plants of the Pacific Northwest Coast* (Pojar and MacKinnon 1994) and the PLANTS Database (USDA NRCS 2012b). During the field investigations by project biologists, dominant plant species were observed and recorded on field data sheets for each data plot (Attachment C).

2.3.2 Wetland Classification and Rating

Wetlands were classified according to the USFWS *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al. 1979). Hydrogeomorphic classifications were assigned to wetlands using the Corps methods established in *A Hydrogeomorphic Classification System for Wetlands* (Brinson 1993). Wetlands were rated according to critical areas ordinances of local jurisdictions and the *Washington State Wetland Rating System for Western Washington – Revised* (Hruby 2004) (Attachment D). Buffer widths were assigned to wetlands based on local jurisdiction requirements (Table 2-2).

2.3.3 Wetland Functional Assessment

Functions of delineated wetlands were assessed using the Washington State Department of Transportation (WSDOT) *Wetland Functions Characterization Tool for Linear Projects* (Null et al. 2000). This is a qualitative tool designed for linear projects to enable the rapid documentation and characterization of functions and values of a particular wetland. This method allows evaluation of wetland functions using best professional judgment and readily observed environmental characteristics. For example, an area of permanent open water is characteristic of a wetland that provides habitat for waterfowl or aquatic animals. The upland habitats and buffers surrounding wetlands were also considered in the evaluation because adjacent land uses affect the performance of wetland functions. Biologists reviewed the indicator characteristics present for each affected wetland and assigned a summary rating of low, moderate, or high for each wetland function (Attachment E). Table 2-3 lists the wetland functions and values evaluated.

Table 2-2. Wetland Categories and Buffer Requirements for Wetlands Located in the Lynnwood Link Extension Study Area

Local Rating System	Wetland Category/Type	Required Buffer Width (feet)
City of Seattle[a]	I	100-200
	II	100-200
	III	60-85
	IV	No buffer-50
City of Shoreline[b]	I	150
	II	115
	III	65
	IV	35
City of Mountlake Terrace[c]	I	300
	II	100
	III	65
	IV	50
City of Lynnwood[d]	I	110
	II	110
	III	75
	IV	40

[a] Based on Seattle Municipal Code 25.09.160.A and 25.09.160.C (buffer widths determined by habitat function scores). Only applicable to development on publicly or privately owned parcels.

[b] Based on Shoreline Municipal Code 20.80.320 and 20.80.330 (standard buffer widths shown)

[c] Based on Mountlake Terrace Municipal Code 16.15.080 and 16.15.090

[d] Based on Lynnwood Municipal Code 17.10.050 and 17.10.051 (standard buffer widths shown)

Table 2-3. Wetland Functions and Values Assessed

Flood Flow Alteration	Habitat for Amphibians
Sediment Removal	Habitat for Wetland-Associated Mammals
Nutrient and Toxicant Removal	Habitat for Wetland-Associated Birds
Erosion Control and Shoreline Stabilization	General Fish Habitat
Production of Organic Matter and its Export	Native Plant Richness
General Habitat Suitability	Educational or Scientific Value
Habitat for Aquatic Invertebrates	Uniqueness and Heritage

2.4 Stream Identification and Classification

2.4.1 Stream Identification

Streams were identified through existing maps and documents, communication with local municipality staff, and field surveys. State and local regulations and guidance were reviewed to assist in identifying stream types and to confirm project compliance with existing laws.

During the reconnaissance phase for the Draft EIS, stream OHWMs were estimated and mapped using GPS. Streams that extend beyond the field reconnaissance survey area and other previously mapped streams outside of the WSDOT or other public rights-of-way were also incorporated into the GIS database.

During the delineation phase for the Preferred Alternative, project biologists flagged stream OHWMs within the delineation survey area, which professional land surveyors then surveyed. Segments of streams outside the delineation survey area but within the field reconnaissance survey area were estimated and mapped using GPS. Rights of entry were obtained for all stream segments in the delineation survey area, so the OHWMs of all streams that may be affected by construction of the Preferred Alternative were delineated. Final stream classification determinations, in accordance with local jurisdictions' critical areas ordinances, will be made during the permitting phase of this project.

Each stream identified in the study area received a unique identifier that is tracked in the project GIS database. Each stream without a formal name was assigned an alphanumeric code based on the city in which it is located (Seattle = SE, Shoreline = SH, Mountlake Terrace = MT, Lynnwood = LY) and the order in which it was encountered in the field (1, 2, 3, etc.). For example, Stream SSH2 is the second field-identified stream in Shoreline.

2.4.2 Stream Classification

Streams in the study area were assigned preliminary classifications based on the systems used by the Cities of Seattle[1], Shoreline, Mountlake Terrace, and Lynnwood, respectively. Each of these stream classification systems classifies and assigns protective buffers to streams based on the presence of fish and whether water flow is perennial or seasonal. Each system is hierarchical; that is, a stream is assigned to a particular category only if it does not meet the criteria of any higher ranking categories.

Identification and classification of streams in this report represent conservative estimates, based on available information and the regulations governing local critical areas. Some of the watercourses identified in this analysis may not actually be defined as streams by the local jurisdictions, or they may be assigned smaller buffers.

The categories of the City of Seattle classification system (Seattle Municipal Code 25.09.020) are as follows:

- **Type 1:** Waters inventoried as "shorelines of the state" under Revised Code of Washington (RCW) Chapter 90.58, but not including periodically inundated areas of their associated wetlands
- **Type 2:** Segments of natural waters that have high value to fish for spawning, rearing, or migration (i.e., having a defined channel width of at least 20 feet and a gradient less than 4 percent), or that are used for off-channel habitat
- **Type 3:** Segments of natural waters that have moderate to slight value to fish for spawning, rearing, or migration (i.e., having a defined channel width of at least 2 feet and a gradient less than 16 percent)
- **Type 4:** Segments of natural waters with perennial flow, lacking fish habitat
- **Type 5:** Segments of natural waters with seasonal flow only, lacking fish habitat

[1] Only applicable to development on publicly or privately owned parcels.

The categories of the City of Shoreline classification system (Shoreline Municipal Code 20.80.470) are as follows:

- **Type I:** Streams identified as "shorelines of the state" under the City's Shoreline Master Program
- **Type II:** Streams that are used by or that have habitat value for salmonids
- **Type III:** Streams with a channel width of at least 2 feet that are not used by salmonids
- **Type IV:** Streams with a channel width less than 2 feet that are not used by salmonids
- **Piped stream segments:** Segments of streams, regardless of their type, that are fully enclosed in an underground pipe or culvert

The categories of the City of Mountlake Terrace classification system (Mountlake Terrace Municipal Code 16.15.080) are as follows:

- **Class I:** Natural streams identified as "shorelines of the state" under the City's Shoreline Master Program
- **Class II:** Natural streams that have documented or significant potential for anadromous fish use
- **Class III:** Natural streams that are not used by anadromous fish
- **Class IV:** Natural streams with a channel width less than 2 feet that are not used by salmonid fish
- **Class V:** Natural streams that are seasonal and do not contain fish

The categories of the City of Lynnwood classification system (Lynnwood Municipal Code 17.10.060) are as follows:

- **Category I:** Scriber Creek, Swamp Creek, Lunds Creek, and Halls Creek
- **Category II:** Streams that flow year-round or that are used by salmonids
- **Category III:** Streams that are naturally intermittent and are not used by salmonids

Cities have jurisdiction over stream buffers, which are regulated through each City's Critical Areas Ordinance. Table 2-4 lists the stream buffer widths for the various stream classifications. The distances presented below are minimum requirements; wider buffers may be required in response to site-specific conditions (e.g., the presence of fish species listed as endangered or threatened under the Endangered Species Act) or the type and intensity of proposed uses.

Table 2-4. Minimum Buffer Requirements for Streams in the Study Area by Local Jurisdiction

Jurisdiction	Stream Classification	Buffer Requirement (feet)
City of Seattle[a]	Type 1	100 feet
	Type 2/3 – anadromous fish	75 feet
	Type 2/3 – no anadromous fish	50 feet
	Type 4	50 feet
	Type 5	50 feet
City of Shoreline[b]	Type I	115 feet
	Type II	75 feet
	Type III	35 feet
	Type IV	25 feet
	Piped	10 feet
City of Mountlake Terrace[c]	Class I	150 feet
	Class II	100 feet
	Class III	65 feet
	Class IV	50 feet
	Class V	Based on review
City of Lynnwood[d]	Category I	100 feet
	Category II	60 feet
	Category III	35 feet

[a] Seattle Municipal Code 25.09.020 (D5) and 25.09.200.A.3.d.1. Only applicable to development on publicly or privately owned parcels.

[b] Shoreline Municipal Code 20.80.470 and 20.80.480

[c] Mountlake Terrace Municipal Code 16.15.080 and 16.15.090

[d] Lynnwood Municipal Code 17.10.060 and 17.10.061

3 RESULTS

3.1 Wetlands

Sound Transit identified 37 wetlands in the study area (Figures 3-1a, 3-1b, and 3-1c; Attachment F). Table 3-1 summarizes classification and rating information for the delineated and other field-identified wetlands in the study area. Potential wetlands outside of public rights-of-way and more than 100 feet from the footprint of the Preferred Alternative were identified via existing documentation and public vantage points (Table 3-2). These potential wetlands include portions of field-identified wetlands that extend beyond the field reconnaissance survey area, as well as areas that appear to meet the wetland criteria that fall entirely outside of this survey area, but could not be ground-truthed. One of the field-identified wetlands (Wetland WSH1) is associated with a ditched swale. Additional sites were investigated but were dropped from analysis after determining that they were constructed stormwater ponds, not wetlands. Of the field-identified wetlands, 1 is rated as Category II according to the Ecology rating system, 23 are rated as Category III, and 4 are rated as Category IV according to the *Washington State Wetland Rating System for Western Washington – Revised* (Hruby 2004). The majority of wetlands are smaller than 0.5 acre, except Wetlands WSE8 (0.66 acre), WMT6 (1.12 acres), and WLY4 (16.54 acres). Existing conditions of field-identified wetlands are described below, organized by local jurisdiction.

Table 3-1. Summary of Field-Identified Wetlands within the Lynnwood Link Extension Study Area

Wetland[a]	Size (acres)	USFWS Class[b]	HGM Class[c]	Ecology Rating[d]	Local Rating[e]	Buffer Width[f] (feet)

3.1.1 Seattle

Wetland WSE1[2]

Size: Approximately 0.42 acre

City of Seattle and Ecology Rating: Category III

USFWS Classification: Palustrine Forested

HGM Classification: Riverine

Sample Plots: WSE1-SP1 and WSE1-SP2

Wetland WSE1 is located in a linear depression east of the I-5 off-ramp, west of 1st Avenue NE, and south of NE 107th Street at Northgate, extending south of the field reconnaissance and delineation survey areas (Figure 3-1a). This wetland is part of the headwaters of the South Branch of Thornton Creek (City of Seattle 2007). Wetland WSE1 was identified as Wetland A for the Northgate Link Extension (North Link) project. Sample Plot WSE1-SP1 characterizes the wetland and Sample Plot WSE1-SP2 characterizes the adjacent upland.

Wetland hydrology is supported primarily by surface water from a stormwater pond to the north, which is conveyed via a pipe under the I-5 on-ramp and off-ramp. Two additional pipes also convey stormwater runoff from local roadways, although no water was present in these pipes during the field investigations. Saturation at the surface was observed along the perimeter of the wetland with channelized flowing water through the center. The channel is well-defined throughout the length of the wetland continuing south out of the study area. Water from this wetland flows south, then continues in stormwater pipes under NE 100th Street to the east, and ultimately into the South Branch of Thornton Creek. Water depth likely varies significantly and can change quickly.

Wetland WSE1 contains a forested community. Vegetation within the wetland is dominated by Pacific willow (*Salix lucida*), Sitka willow (*Salix sitchensis*), red-osier dogwood (*Cornus sericea*), and Himalayan blackberry (*Rubus armeniacus*). Red alder (*Alnus rubra*), watercress (*Nasturtium officinale*), climbing nightshade (*Solanum dulcamara*), giant horsetail (*Equisetum telmateia*), and bluegrass (*Poa* spp.) were also observed.

Soil was examined to a depth of 26 inches and consists of two layers. The top layer is a 5-inch very dark brown (10YR 2/2) gravelly silt loam. The lower layer is a greenish-gray (5GY 5/1) sand. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WSE1 consists of roadways and steep vegetated fill slopes. The upper slopes are generally maintained grasses and disturbance-tolerant forbs. Invasive species such as poison hemlock (*Conium maculatum*), Canadian thistle (*Cirsium arvense*), and Scotch broom (*Cytisus scoparius*) were also present. The lower slopes consist of western redcedar (*Thuja plicata*), big-leaf maple (*Acer macrophyllum),* pine (*Pinus* spp.), cascara (*Frangula purshiana*), tall Oregon grape (*Mahonia aquifolium*), western swordfern (*Polystichum munitum*), red-osier dogwood, Indian plum (*Oemleria*

[2] This wetland is in the city of Seattle within the road right-of-way (not on a publicly or privately owned parcel) and may not be subject to the City of Seattle Critical Areas Ordinance (Seattle Municipal Code 25.09).

cerasiformis), common hawthorn (*Crataegus monogyna*), red elderberry (*Sambucus racemosa*), and Himalayan blackberry. Many of these native plants may have been planted.

Wetland WSE1 is classified as palustrine forested under the USFWS system, and riverine under the hydrogeomorphic (HGM) system. Wetland WSE1 is rated Category III according to the City of Seattle (Seattle Municipal Code 25.09.160.A) and Ecology. The wetland scored 42 points on Ecology's rating form (16 points for water quality, 16 points for hydrologic functions, and 10 points for habitat functions) (Attachment D). The City of Seattle requires a standard 60-foot buffer for Category III wetlands with lower levels of habitat function (Seattle Municipal Code 25.09.160.C).

Wetland WSE3[3]

Size: Approximately 0.05 acre

City of Seattle and Ecology Rating: Category III

USFWS Classification: Palustrine Emergent

HGM Classification: Depressional

Sample Plots: WSE3-SP1, WSE3-SP2, WSE3-SP3, and WSE3-SP4

Wetland WSE3 is located east of I-5 and west of 5th Avenue NE, west of the Jackson Park Golf Course (see Figure 3-1a). The wetland is located entirely within the delineation survey area near the I-5 right-of-way fence and toe of the I-5 fill slope. Sample Plot WSE3-SP1 characterizes the wetland and Sample Plots WSE3-SP2, WSE3-SP3, and WSE3-SP4 characterize the adjacent upland.

Wetland hydrology is primarily supported by stormwater runoff from I-5. A concrete-lined ditch, situated along the east side of the wetland and adjacent to 5th Avenue NE, conveys water to Wetland WSE3 and provides an outlet where water is eventually piped under 5th Avenue NE to the North Branch of Thornton Creek. Wetland WSE3 likely also has a high groundwater table. Small areas of inundation in micro-depressions were observed, as well as saturation of soils.

Wetland WSE3 contains an emergent community dominated by reed canarygrass (*Phalaris arundinacea*). Some Himalayan blackberry and one cascara were also present.

Soil was examined to a depth of 18 inches and consists of two layers. The top layer is a 10-inch black (10YR 2/1) silt loam. The lower layer is a very dark gray (10YR 3/1) gravelly sandy loam with grayish brown (10YR 5/2) gravelly sandy loam inclusions that have yellowish brown (10YR 5/8) redoximorphic features. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The vegetated buffer surrounding Wetland WSE3 consists of a relatively narrow band between the wetland and roadways (I-5 and 5th Avenue NE). Maintained grasses and shrubs (primarily Himalayan blackberry) cover most of the buffer, with a forested area to the north. Species include red alder, ornamental maples (*Acer* sp.), western redcedar, birch (*Betula* spp.), Himalayan blackberry, common hawthorn, Scotch broom, reed canarygrass, western swordfern, and maintained grasses and forbs.

[3] This wetland is in the city of Seattle within road right-of-way (not on a publicly or privately owned parcel) and may not be subject to the City of Seattle Critical Areas Ordinance (Seattle Municipal Code 25.09).

Wetland WSE3 is classified as palustrine emergent under the USFWS system, and is a depressional wetland under the HGM system. Wetland WSE3 is rated a Category III according to the City of Seattle (Seattle Municipal Code 25.09.160.A) and Ecology. The wetland scored 32 points on Ecology's rating form (14 points for water quality, 10 points for hydrologic functions, and 8 points for habitat functions) (Attachment D). The City of Seattle requires a standard 60-foot buffer for Category III wetlands with a lower level of habitat function (Seattle Municipal Code 25.09.160.C).

Wetland WSE4[4]

Size: Approximately 0.12 acre

City of Seattle and Ecology Rating: Category III

USFWS Classification: Palustrine Forested

HGM Classification: Depressional

Sample Plots: WSE4-SP1 and WSE4-SP2

Wetland WSE4 is located in a ditch east of 5th Avenue NE and west of the Jackson Park Golf Course (see Figure 3-1a). The wetland is located entirely within the delineation survey area. Sample Plot WSE4-SP1 characterizes the wetland and Sample Plot WSE4-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by stormwater runoff and a high groundwater table. Saturation and inundation were observed in the wetland, and drainage patterns have formed as well. The wetland drains north to the North Branch of Thornton Creek.

Wetland WSE4 contains a forested community. Vegetation within the wetland includes western redcedar, Pacific willow, red alder, salmonberry (*Rubus spectabilis*), water parsley (*Oenanthe sarmentosa*), giant horsetail, and common ladyfern (*Athyrium filix-femina*). Himalayan blackberry and English ivy (*Hedera helix*) occur along the edge.

Soil was examined to a depth of 18 inches and consists of three layers. The top layer is a 5-inch black (10YR 2/1) mucky loam. The middle layer is a dark greenish gray (10Y 4/1) fine sandy loam with brown (10YR 4/3) redoximorphic features. The lower layer is a very dark gray (5Y 3/1) gravelly sandy loam. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WSE4 consists of a thin strip of shrubs immediately adjacent to the wetland, maintained road right-of-way farther to the west, Jackson Park Golf Course and Trail to the east, and shrubs with few trees to the north and south. Species include salmonberry, Himalayan blackberry, laurel (*Laurus nobilis*), and western redcedar.

Wetland WSE4 is classified as palustrine forested under the USFWS system and depressional under the HGM system. Wetland WSE4 is rated a Category III according to the City of Seattle (Seattle Municipal Code 25.09.160.A) and Ecology. The wetland scored 40 points on Ecology's rating form (14 points for water quality, 16 points for hydrologic functions, and 10 points for habitat functions)

[4] This wetland is in the city of Seattle within road right-of-way (not on a publicly or privately owned parcel) and may not be subject to the City of Seattle Critical Areas Ordinance (Seattle Municipal Code 25.09).

(Attachment D). The City of Seattle requires a standard 60-foot buffer for Category III wetlands with a lower level of habitat function (Seattle Municipal Code 25.09.160.C).

Wetland WSE5[5]

Size: Approximately 0.26 acre

City of Seattle and Ecology Rating: Category III

USFWS Classification: Palustrine Forested

HGM Classification: Depressional

Sample Plots: WSE5-SP1 and WSE5-SP2

Wetland WSE5 is located east of I-5 and west of 5th Avenue NE, west of the Jackson Park Golf Course (see Figure 3-1a). The wetland crosses the I-5 right-of-way fence, ranging from the lower portion of the I-5 fill slope down to the toe. Wetland WSE5 is located entirely within the delineation survey area. Sample Plot WSE5-SP1 characterizes the wetland and Sample Plot WSE5-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by a high groundwater table, precipitation, and occasional overbank flow from Thornton Creek. Saturation and inundation were observed in the wetland. No inlet was observed. The northern portion of the wetland drains to the North Branch of Thornton Creek and the southern portion drains to Stream SSE1, which flows to the North Branch of Thornton Creek under 5th Avenue SE.

Wetland WSE5 contains a forested community. Species within the wetland includes red alder, salmonberry, giant horsetail, common ladyfern, reed canarygrass, common rush (*Juncus effusus*), small-fruited bulrush (*Scirpus microcarpus*), climbing nightshade, bitter dock (*Rumex obtusifolius*), and Himalayan blackberry. A ponded area near the road contained American speedwell (*Veronica americana*), broadleaf cattail (*Typha latifolia*), small-fruited bulrush, northwest territory sedge (*Carex utriculata*), creeping buttercup (*Ranunculus repens*), water parsley, and twoheaded water-starwort (*Callitriche heterophylla*). A patch of Japanese knotweed (*Polygonum cuspidatum*) occurs at the south end, extending into the buffer.

Soil was examined to a depth of 19 inches and consists of one layer. The soil is a black (10YR 2/1) gravelly sandy loam with cobbles. The soil has a high concentration of organics and partially decomposed debris throughout the profile. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer is narrow, composed of vegetated fill slopes for I-5 and 5th Avenue NE. Species include red alder, Himalayan blackberry, English ivy, English holly (*Ilex aquifolium*), Douglas fir (*Pseudotsuga menziesii*), and maintained disturbance-tolerant grasses and forbs. There is no functioning buffer to the east (roadway).

Wetland WSE5 is classified as palustrine forested under the USFWS system and depressional under the HGM system. Wetland WSE5 is rated a Category III according to the City of Seattle (Seattle

[5] This wetland is in the city of Seattle within road right-of-way (not on a publicly or privately owned parcel) and may not be subject to the City of Seattle Critical Areas Ordinance (Seattle Municipal Code 25.09).

Municipal Code 25.09.160.A) and Ecology. The wetland scored 36 points on Ecology's rating form (14 points for water quality, 10 points for hydrologic functions, and 12 points for habitat functions) (Attachment D). The City of Seattle requires a standard 60-foot buffer for Category III wetlands with a lower level of habitat function (Seattle Municipal Code 25.09.160.C).

Wetland WSE6[6]

Size: Approximately 0.08 acre

City of Seattle and Ecology Rating: Category III

USFWS Classification: Palustrine Scrub-Shrub

HGM Classification: Depressional

Sample Plot: WSE6-SP1

Wetland WSE6 is a shallow, linear depression located east of the northbound I-5 off-ramp for NE 145th Street and west of 5th Avenue NE, west of the Jackson Park Golf Course (see Figure 3-1a). The wetland is located entirely within the delineation survey area. Sample Plot WSE6-SP1 characterizes the wetland.

Wetland hydrology is supported by precipitation, stormwater runoff, and a high groundwater table. There are no inlets or outlets to Wetland WSE6. Small pockets of inundation in micro-depressions and saturated soils were observed.

Wetland WSE6 contains a scrub-shrub community. Vegetation within the wetland is dominated by rose spirea (*Spiraea douglasii*) and reed canarygrass. Common ladyfern, Himalayan blackberry, red alder, and one birch are also present.

Soil was examined to a depth of 18 inches and consists of two layers. The top layer is a 9-inch black (10YR 2/1) gravelly silt loam. The lower layer is a dark grayish brown (10YR 4/2) gravelly sandy loam. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffers are narrow and composed of vegetation on the shoulders of I-5 and 5th Avenue NE. The vegetation surrounding Wetland WSE6 consists primarily of maintained disturbance-tolerant species of grasses and forbs within the I-5 right-of-way along with Himalayan blackberry and rose spirea. A small area to the south contains red alder, Douglas fir, and Himalayan blackberry.

Wetland WSE6 is classified as palustrine scrub-shrub under the USFWS system and depressional under the HGM system. Wetland WSE6 is rated a Category III according to the City of Seattle (Seattle Municipal Code 25.09.160.A) and Ecology. The wetland scored 38 points on Ecology's rating form (12 points for water quality, 18 points for hydrologic functions, and 8 points for habitat functions) (Attachment D). The City of Seattle requires a standard 60-foot buffer for Category III wetlands with a lower level of habitat function (Seattle Municipal Code 25.09.160.C).

[6] This wetland is in the city of Seattle within road right-of-way (not on a publicly or privately owned parcel) and may not be subject to the City of Seattle Critical Areas Ordinance (Seattle Municipal Code 25.09).

Wetland WSE7[7]

Size: Approximately 0.19 acre

City of Seattle and Ecology Rating: Category III

USFWS Classification: Palustrine Scrub-Shrub/Palustrine Emergent

HGM Classification: Depressional

Sample Plots: WSE7-SP1 and WSE7-SP2

Wetland WSE7 is a shallow, linear depression located east of the I-5 mainline and west of a transit off-ramp, just south of NE 145th Street (see Figure 3-1a). The wetland is located entirely within the delineation survey area. Sample Plot WSE7-SP1 characterizes the wetland and Sample Plot WSE7-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by precipitation, stormwater runoff, and a high groundwater table. There are no inlets to Wetland WSE7. A catch basin is located at the south end of the wetland providing an outlet. Areas of inundation and saturated soils were observed in the wetland.

Wetland WSE7 contains scrub-shrub and emergent communities. Vegetation within the scrub-shrub community is dominated by Himalayan blackberry with some broadleaf cattail and climbing nightshade intermixed. Vegetation within the emergent community is mostly broadleaf cattail, stalk-grain sedge (Carex stipata), common rush, and common duckweed (*Lemna minor*). Some maintained grasses and forbs, along with reed canarygrass, are also present in the emergent community.

Soil was examined to a depth of 20 inches and consists of two layers. The top layer is a 6-inch black (10YR 2/1) silt loam. The lower layer is a black (10YR 2/1) gravelly sandy loam. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WSE7 is mowed right-of-way dominated by disturbance-tolerant grasses and forbs. Some Himalayan blackberry is also growing within the buffer.

Wetland WSE7 is classified as palustrine scrub-shrub/palustrine emergent under the USFWS system and depressional under the HGM system (Brinson 1993). Wetland WSE7 is rated a Category III according to the City of Seattle (Seattle Municipal Code 25.09.160.A) and Ecology. The wetland scored 35 points on Ecology's rating form (14 points for water quality, 10 points for hydrologic functions, and 11 points for habitat functions) (Attachment D). The City of Seattle requires a standard 60-foot buffer for Category III wetlands with a lower level of habitat function (Seattle Municipal Code 25.09.160.C).

[7] This wetland is in the city of Seattle within road right-of-way (not on a publicly or privately owned parcel) and may not be subject to the City of Seattle Critical Areas Ordinance (Seattle Municipal Code 25.09).

Wetland WSE8[8]

Size: Approximately 0.66 acre

City of Seattle and Ecology Rating: Category III

USFWS Classification: Palustrine Forested/Palustrine Scrub-Shrub

HGM Classification: Depressional

Sample Plots: WSE8-SP1 and WSE8-SP2

Wetland WSE8 is located east of 5th Avenue NE and west of the Jackson Park Golf Course, extending out of the delineation survey area to the east (see Figure 3-1a). Sample Plot WSE8-SP1 characterizes the wetland and WSE8-SP2 characterizes the upland.

Wetland hydrology is supported by stormwater runoff and a high groundwater table. Flowing water, inundation, and saturated soils were observed during the site investigations. Surface water flows south in a ditch within the wetland. No inlet was apparent, but the wetland drains to the North Branch of Thornton Creek.

Wetland WSE8 contains forested and scrub-shrub communities. Vegetation within the forested community is dominated by young red alder, Sitka willow, Pacific willow, salmonberry, rose spirea, and giant horsetail. Vegetation within the scrub-shrub community is dominated by salmonberry, Himalayan blackberry, and rose spirea. Other species observed include common ladyfern, creeping buttercup, and climbing nightshade.

Soil was examined to a depth of 22 inches and consists of three layers. The top layer is a 10-inch black (10YR 2/1) very mucky loam. The middle layer is a very dark gray (10YR 3/1) very mucky loam from 10 to 20 inches. The lower layer is a very dark greenish gray (10Y 3/1) gravelly sand. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WSE8 is dominated by disturbance-tolerant species of grasses and forbs to the west within the maintained roadside and maintained grasses to the west (golf course). Unmaintained areas of the buffer consist of red alder, Himalayan blackberry, English holly, English ivy, and western swordfern.

Wetland WSE8 is classified as palustrine forested/palustrine scrub-shrub under the USFWS system, and depressional under the HGM system. Wetland WSE8 is rated a Category III according to the City of Seattle (Seattle Municipal Code 25.09.160.A) and Ecology. The wetland scored 43 points on Ecology's rating form (18 points for water quality, 10 points for hydrologic functions, and 15 points for habitat functions) (Attachment D). The City of Seattle requires a standard 60-foot buffer for Category III wetlands with a lower level of habitat function (Seattle Municipal Code 25.09.160.C).

[8] Portions of this wetland are in the city of Seattle within road right-of-way (not on a publicly or privately owned parcel) and may not be subject to the City of Seattle Critical Areas Ordinance (Seattle Municipal Code 25.09).

3.1.2 Shoreline

Wetland WSH1

Size: Approximately 0.06 acre

City of Shoreline Rating: Type III

Ecology Rating: Category IV

USFWS Classification: Palustrine Emergent

HGM Classification: Depressional

Sample Plots: WSH1-SP1 and WSH1-SP2

Wetland WSH1 is located east of I-5, north of NE 145th Street, and west of 5th Avenue NE, in a maintained area of the I-5 right-of-way (see Figure 3-1a). The western portion is connected to a ditched swale associated with I-5 stormwater conveyance and the northern portion is a grassy slope. This wetland is located entirely within the delineation survey area. Sample Plot WSH1-SP1 characterizes the wetland and Sample Plot WSH1-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by a high groundwater table and stormwater runoff. The wetland had areas inundated, saturated, and containing drainage patterns during the site investigation. The outlet of Wetland WSH1 is a catch basin located at the southeastern corner of the wetland. Stormwater flows from the ditch to the wetland along the southern boundary.

Wetland WSH1 contains an emergent community that is mostly maintained. The dominant vegetation includes maintained grasses and forbs, including common rush, colonial bentgrass (*Agrostis capillaris*), red fescue (*Festuca rubra*), tall fescue (*Schedonorus phoenix*), small-fruited bulrush, giant horsetail, field horsetail (*Equisetum arvense*), creeping buttercup, American speedwell, muskflower (*Mimulus moschatus*), watercress, white clover (*Trifolium repens*), red clover (*Trifolium pratense*), and other rush and sedge species (*Juncus* sp. and *Carex* sp.). Common cattail and Himalayan blackberry are located around the outlet and some black cottonwood (*Populus trichocarpa*) along the wetland edge.

Soil was examined to a depth of 18 inches and consists of two layers. The top layer is an 8-inch very dark gray (10YR 3/1) silt loam. The lower layer is a dark gray (2.5Y 4/1) gravelly sandy loam with light olive brown (2.5Y 5/6) redoximorphic features. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WSH1 consists primarily of maintained grass, especially to the northwest, but also includes Himalayan blackberry and giant horsetail. Himalayan blackberry is dominant to the east and overhangs the wetland boundary. Few trees are present in the buffer.

Wetland WSH1 is classified as palustrine emergent under the USFWS system and depressional under the HGM system. According to the City of Shoreline, Wetland WSH1 is rated a Type III (Shoreline Municipal Code 20.80.320). According to Ecology's wetland rating system, the wetland is rated a Category IV based on its score. The wetland scored 27 points on Ecology's rating form (10 points for water quality, 10 points for hydrologic functions, and 7 points for habitat functions) (Attachment D). The City of Shoreline requires a standard 65-foot buffer for Type III (Shoreline Municipal Code 20.80.330).

Wetland WSH2

Size: Approximately 0.37 acre

City of Shoreline Rating: Type III

Ecology Rating: Category III

USFWS Classification: Palustrine Forested/Palustrine Emergent

HGM Classification: Depressional

Sample Plots: WSH2-SP1, WSH2-SP2, WSH2-SP3, WSH2-SP4, WSH2-SP5, WSH2-SP6, and WSH2-SP7

Wetland WSH2 is located on a gentle slope and shallow depression east of I-5, straddling the highway noise wall, within the WSDOT right-of-way and on private property, in the vicinity of NE 152nd Street, extending east of the delineation survey area (see Figure 3-1a). Sample Plots WSH2-SP1, WSH2-SP3, WSH2-SP5, and WSH2-SP7 characterize the wetland and Sample Plot WSH2-SP2, WSH2-SP4, and WSH2-SP6 characterize the adjacent upland.

Wetland hydrology is supported by a high groundwater table and some drainage from residences outside of the field survey area to the east. The wetland was saturated and inundated during the site investigations and drainage patterns were visible. Water flows to the west into a ditch along I-5.

Wetland WSH2 contains forested and emergent communities. Vegetation within the wetland is primarily maintained grasses and forbs, as well as common rush, small-fruited bulrush, reed canarygrass, and creeping buttercup. A large weeping willow (*Salix babylonica*) with Himalayan blackberry and salmonberry comprise a forested area to the southeast.

At Sample Plot WSH2-SP1, soil was examined to a depth of 20 inches and consists of two layers. The top layer is an 11-inch very dark brown (10YR 2/2) gravelly sandy loam with very dark brown (7.5YR 2.5/3) and dark reddish brown (5YR 3/4) redoximorphic features. The lower layer is a dark grayish brown (10YR 4/2) compacted silt loam. At Sample Plot WSH2-SP3, soil was examined to a depth of 18 inches and consists of two layers. The top layer is a 15-inch black (10YR 2/1) silt loam, and the lower layer is a loam with a matrix consisting of two colors—very dark brown (10YR 2/2) and gray (10YR 5/1). At Sample Plot WSH2-SP5, soil was examined to a depth of 18 inches and consists of three layers. The top layer is a 6-inch very dark grayish brown (10YR 3/2) gravelly sandy loam. The middle layer is a grayish brown (2.5Y 5/2) gravelly sandy loam with dark brown (7.5YR 3/4) redoximorphic features. The lower layer is a gray (2.5Y 5/1) gravelly sandy loam with strong brown (7.5YR 4/6) redoximorphic features.

At Sample Plot WSH2-SP7, soil was examined to a depth of 17 inches and consists of three layers over a hard pan. The top layer is an 8-inch very dark grayish brown (10YR 3/2) gravelly sandy loam. The middle layer is a very dark grayish brown (10YR 3/2) gravelly sandy loam with dark brown (7.5YR 3/4) redoximorphic features. The lower layer is a black (10YR 2/1) gravelly sandy loam with dark yellowish brown (10YR 4/6) redoximorphic features. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The vegetated buffer surrounding Wetland WSH2 consists primarily of maintained grasses and forbs in the I-5 right-of-way and on private property. Structures with yards are present to the east. There

are some trees (including western redcedar) in the southern buffer, with an understory of Himalayan blackberry, laurel, and climbing nightshade.

Wetland WSH2 is classified as palustrine forested/palustrine emergent under the USFWS system, and depressional under the HGM system. According to the City of Shoreline, Wetland WSH2 is rated a Type III (Shoreline Municipal Code 20.80.320). According to Ecology's wetland rating system, the wetland is rated a Category III based on its score. The wetland scored 34 points on Ecology's rating form (6 points for water quality, 20 points for hydrologic functions, and 8 points for habitat functions) (Attachment D). The City of Shoreline requires a standard 65-foot buffer for Type III wetlands (Shoreline Municipal Code 20.80.330).

Wetland WSH3

Size: Approximately 0.09 acre

City of Shoreline Rating: Type III

Ecology Rating: Category III

USFWS Classification: Palustrine Emergent

HGM Classification: Depressional

Sample Plots: WSH3-SP1 and WSH3-SP2

Wetland WSH3 is located east of I-5, just south of NE 155th Street, and west of the fire station (see Figure 3-1a). This wetland is primarily in a linear depression, located entirely within the delineation survey area. Sample Plot WSH3-SP1 characterizes the wetland and Sample Plot WSH3-SP2 characterizes the adjacent upland.

Wetland hydrology is primarily supported by shallow groundwater and precipitation; however, surface runoff from the fire station parking lot may also contribute to the hydrology. The wetland drains south to a ditch within the I-5 right-of-way. Inundation and saturated soils were observed during the field investigation.

Wetland WSH3 contains an emergent community. Vegetation within the wetland is dominated by reed canarygrass, but also includes one western redcedar, some Himalayan blackberry, giant horsetail, and climbing nightshade.

Soil was examined to a depth of 19 inches and consists of two layers. The top layer is a 5-inch dark grayish brown (10YR 4/2) gravelly sandy loam. The lower layer is a dark grayish brown (10YR 4/2) gravelly sandy loam with cobbles and strong brown (7.5YR 4/6) redoximorphic features. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WSH3 consists of a narrow slope dominated by reed canarygrass and Himalayan blackberry to the north and south. The buffer to the west is the I-5 fill slope, dominated by Himalayan blackberry, a row of Douglas fir trees, and maintained grasses. To the east there is a narrow row of ornamental trees along the edge of the parking lot of the fire station.

Wetland WSH3 is classified as palustrine emergent under the USFWS system and depressional under the HGM system. According to the City of Shoreline, Wetland WSH3 is rated a Type III (Shoreline Municipal Code 20.80.320). According to Ecology's wetland rating system, the wetland is rated a

Category III based on its score. The wetland scored 35 points on Ecology's rating form (14 points for water quality, 16 points for hydrologic functions, and 5 points for habitat functions) (Attachment D). The City of Shoreline requires a standard 65-foot buffer for Type III wetlands (Shoreline Municipal Code 20.80.330).

Wetland WSH4

Size: Approximately 0.10 acre

City of Shoreline Rating: Type III

Ecology Rating: Category III

USFWS Classification: Palustrine Forested/Palustrine Emergent

HGM Classification: Depressional

Sample Plots: WSH4-SP1, WSH4-SP2, and WSH4-SP3

Wetland WSH4 is located east of the I-5 off-ramp to State Route (SR) 104 and west of Forest Park Drive NE, extending northeast of the field reconnaissance and delineation survey areas (see Figure 3-1b). This linear wetland is near the I-5 right-of-way fence, ranging from the lower portion of the I-5 fill slope down to the toe. Sample Plots WSH4-SP1 and WSH4-SP3 characterize the wetland and Sample Plot WSH4-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by a high groundwater table and seeps. The seeps are located along the northwest boundary of the wetland. No specific inlet was observed. Water flows to the northeast in a swale at the edge of the I-5 right-of-way, draining to McAleer Creek. Inundation and saturated soils were observed during the field investigation.

Wetland WSH4 contains forested and emergent communities. Vegetation within the forested community includes red alder, salmonberry, twinberry honeysuckle (*Lonicera involucrata*), reed canarygrass, common ladyfern, fowl mannagrass (*Glyceria striata*), creeping buttercup, Himalayan blackberry, and giant horsetail. The vegetation within the emergent community includes giant horsetail, common ladyfern, Himalayan blackberry, American speedwell, fringed willowherb (*Epilobium ciliatum*), common duckweed, and twoheaded water-starwort.

At Sample Plot WSH4-SP1, soil was examined to a depth of 20 inches and consists of two layers. The top layer is a 17-inch black (10YR 2/1) silt loam with organics. The lower layer is a very dark gray (10YR 3/1) and dark grayish brown (10YR 4/2) very sandy loam with gravel and cobbles. At Sample Plot WSH4-SP3, soil was examined to a depth of 20 inches and consists of two layers. The top layer is a 15-inch black (10YR 2/1) silt loam with organics. The lower layer is a black (10YR 2/1) and dark grayish brown (10YR 4/2) gravelly sandy loam with cobbles. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer on the slope, north and west of Wetland WSH4, consists of Douglas fir, Himalayan blackberry, and Indian plum. The buffer consists of maintained residential yards, roads, and driveways to the south and east.

Wetland WSH4 is classified as palustrine forested/palustrine emergent under the USFWS system and depressional under the HGM system. According to the City of Shoreline, Wetland WSH4 is

rated a Type III (Shoreline Municipal Code 20.80.320). According to Ecology's wetland rating system, the wetland is rated a Category III based on its score. The wetland scored 37 points on Ecology's rating form (14 points for water quality, 10 points for hydrologic functions, and 13 points for habitat functions) (Attachment D). The City of Shoreline requires a standard 65-foot buffer for Type III wetlands (Shoreline Municipal Code 20.80.330).

Wetland WSH5

Size: Approximately 0.48 acre

City of Shoreline Rating: Type III

Ecology Rating: Category III

USFWS Classification: Palustrine Forested

HGM Classification: Depressional

Sample Plots: WSH5-SP1 and WSH5-SP2

Wetland WSH5 is in a deep depression associated with McAleer Creek, surrounded by roadway fill slopes. It is located entirely within the delineation survey area east of I-5 inside the northbound on-ramp cloverleaf south of SR 104 (see Figure 3-1b). Sample Plot WSH5-SP1 characterizes the wetland and Sample Plot WSH5-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by McAleer Creek, stormwater drainages, and a shallow groundwater table. Seeps and drainage patterns were also observed along the slopes of the wetland. The primary inlet and outlet are large culverts associated with McAleer Creek. Both the wetland and stream drain to the south.

Wetland WSH5 contains a forested community. Vegetation within the wetland includes red alder, black cottonwood, birch, rose spirea, Scouler's willow (*Salix scouleriana*), salmonberry, twinberry honeysuckle, reed canarygrass, small-fruited bulrush, giant horsetail, creeping buttercup, common ladyfern, coastal hedgenettle (*Stachys chamissonis*), climbing nightshade, and fringed willowherb.

Soil was examined to a depth of 18 inches and consists of two layers. The top layer is a 10-inch very dark grayish brown (10YR 3/2) sandy loam. The lower layer is a very dark greenish gray (10Y 3/1) gravelly sand with dark yellowish brown (10YR 4/6) redoximorphic features. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WSH5 consists of coniferous and deciduous trees. Species include Douglas fir, black cottonwood, red alder, western redcedar, ornamental maple, and ornamental cherry (*Prunus* sp.) Understory vegetation consists of Himalayan blackberry, rose spirea, Indian plum, English holly, trailing blackberry (*Rubus ursinus*), western swordfern, giant horsetail, and English ivy. Additionally, a narrow band of maintained herbaceous vegetation, including tick quackgrass (*Thinopyrum pycnanthum*), is located near the roadways.

Wetland WSH5 is classified as palustrine forested under the USFWS system and depressional under the HGM system. According to the City of Shoreline, Wetland WSH5 is rated a Type III (Shoreline Municipal Code 20.80.320). According to Ecology's wetland rating system, the wetland is rated a Category III based on its score. The wetland scored 33 points on Ecology's rating form (12 points for

water quality, 6 points for hydrologic functions, and 15 points for habitat functions) (Attachment D). The City of Shoreline requires a standard 65-foot buffer for Type III wetlands (Shoreline Municipal Code 20.80.330).

3.1.3 Mountlake Terrace

Wetland WMT1

Size: Approximately 0.49 acre

City of Mountlake Terrace and Ecology Rating: Category III

USFWS Classification: Palustrine Forested

HGM Classification: Depressional

Sample Plots: WMT1-SP1 and WMT1-SP2

Wetland WMT1 is in a deep depression associated with McAleer Creek surrounded by roadway fill slopes. It is located entirely within the delineation survey area east of I-5 inside of the cloverleaf northbound off-ramp, north of SR 104 (see Figure 3-1b). Sample Plot WMT1-SP1 characterizes the wetland and Sample Plot WMT1-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by McAleer Creek, stormwater runoff, a shallow groundwater table, and seeps. Saturation at the surface was commonly observed throughout the wetland, especially near the base of slopes. The wetland also contains inundated micro-depressions and drainage channels. Large amounts of stormwater were observed flowing from a pipe southwest of the wetland, down a rock-lined channel through Wetland WMT1 to McAleer Creek. The primary inlet and outlet are large culverts associated with McAleer Creek. The stream channel is well-defined throughout most of the wetland. The wetland drains to McAleer Creek, which flows to the south (to Wetland WSH5).

Wetland WMT1 contains a forested community dominated by red alder, black cottonwood, salmonberry, Himalayan blackberry, twinberry honeysuckle, rose spirea, common ladyfern, giant horsetail, and creeping buttercup. Other species observed include birch, Himalayan blackberry English holly, Indian plum, pale yellow iris (*Iris pseudacorus*), reed canarygrass, largeleaf avens (*Geum macrophyllum*), fringed willowherb, climbing nightshade, western touch-me-not (*Impatiens noli-tangere*), and western swordfern.

Soil was examined to a depth of 18 inches and consists of three layers. The top layer is a 5-inch very dark grayish brown (10YR 3/2) silt loam. The middle layer is a 4-inch dark gray (10YR 4/1) gravelly sandy loam with dark yellowish brown (10YR 4/6) redoximorphic features. The lower layer is a dark gray (10YR 4/1) very sandy loam with dark yellowish brown (10YR 4/6) redoximorphic features. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WMT1 consists of coniferous and deciduous trees. Species include Douglas fir, black cottonwood, red alder, birch, western hemlock (*Tsuga heterophylla*), and bitter cherry (*Prunus emarginata*). Understory vegetation consists of Himalayan blackberry, rose spirea, Indian plum, English holly, western swordfern, and giant horsetail. Additionally, a narrow band of maintained herbaceous vegetation is located near the roadways.

Wetland WMT1 is classified as palustrine forested under the USFWS system and depressional under the HGM system. Wetland WMT1 is rated a Category III according to the City of Mountlake Terrace (Mountlake Terrace Municipal Code 16.15.080) and Ecology. The wetland scored 33 points on Ecology's rating form (12 points for water quality, 6 points for hydrologic functions, and 15 points for habitat functions) (Attachment D). The City of Mountlake Terrace requires a standard 65-foot buffer for Category III wetlands (Mountlake Terrace Municipal Code 16.15.090).

Wetland WMT2

Size: Approximately 0.17 acre

City of Mountlake Terrace and Ecology Rating: Category III

USFWS Classification: Palustrine Forested

HGM Classification: Riverine/Slope

Sample Plots: WMT2-SP1, WMT2-SP2, and WMT2-SP3

Wetland WMT2 is located east of I-5, northeast of the northbound I-5 on-ramp from SR 104 and southeast of Gateway Place (see Figure 3-1b). This wetland is on a steep slope extending down to McAleer Creek, located entirely within the delineation survey area. Sample Plots WMT2-SP1 and WMT2-SP3 characterize the wetland and Sample Plot WMT2-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by McAleer Creek and seeps. Areas of saturation and inundation were observed in the wetland. The stream channel is well-defined throughout most of the wetland. McAleer Creek flows from the northwest (from the Nile Shrine Golf Course west of I-5) to the south in a pipe under the northbound I-5 on-ramp to Wetland WMT1.

Wetland WMT2 contains a forested community. Vegetation on the slope consists of black cottonwood and red alder in the overstory, with an understory dominated by scouring rush (*Equisetum hyemale*). Other species include Himalayan blackberry, trailing blackberry, salmonberry, laurel, English holly, Indian plum, common hawthorn, reed canarygrass, western swordfern, coastal hedgenettle, and giant horsetail. Vegetation in and adjacent to McAleer Creek includes overhanging black cottonwood, salmonberry, Himalayan blackberry, pale yellow iris, creeping buttercup, small-fruited bulrush, reed canarygrass, climbing nightshade, western touch-me-not, and giant horsetail.

At Sample Plot WMT2-SP1, soil was examined to a depth of 12 inches and consists of two layers. The top layer is a 6-inch very dark grayish brown (10YR 3/2) sandy loam. The lower layer is a dark grayish brown (2.5Y 4/2) gravelly sandy loam with yellowish brown (10YR 5/6) redoximorphic features. There is an extremely compacted restrictive layer at 12 inches. At Sample Plot WMT2-SP3, soil was examined to a depth of 20 inches and consists of four layers. The top layer is a 3-inch black (10YR 2/1) loam. The second layer is a dark gray (10YR 4/1) compacted sand with dark yellowish brown (10YR 3/6) redoximorphic features. The third layer is a very dark gray (10YR 3/1) compacted sand with gravel and small cobbles that has dark yellowish brown (10YR 3/6) redoximorphic features. The lowest layer is a very dark gray (10YR 3/1) sandy loam. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WMT2 consists generally of steep vegetated slopes. Species growing east of the wetland include Douglas fir, red alder, bitter cherry, bigleaf maple, ornamental

maple, Himalayan blackberry, trailing blackberry, and western swordfern. The buffer to the west consists of Douglas fir, western redcedar, red alder, ornamental maple, black cottonwood, Indian plum, Himalayan blackberry, trailing blackberry, and western swordfern.

Wetland WMT2 is classified as palustrine forested under the USFWS system, and riverine/slope under the HGM system. Wetland WMT2 is rated a Category III according to the City of Mountlake Terrace (Mountlake Terrace Municipal Code 16.15.080) and Ecology. The wetland scored 46 points on Ecology's rating form (16 points for water quality, 16 points for hydrologic functions, and 14 points for habitat functions) (Attachment D). The City of Mountlake Terrace requires a standard 65-foot buffer for Category III wetlands (Mountlake Terrace Municipal Code 16.15.090).

Wetland WMT3

Size: Approximately 0.07 acre

City of Mountlake Terrace and Ecology Rating: Category III

USFWS Classification: Palustrine Forested

HGM Classification: Depressional

Sample Plots: WMT3-SP1 and WMT3-SP2

Wetland WMT3 is in a small, shallow depression east of I-5, east of the northbound I-5 off-ramp, west of 237th Street SW, and south of 236th Street SW (see Figure 3-1c). The wetland is located entirely within the field survey area. Sample Plot WMT3-SP1 characterizes the wetland and Sample Plot WMT3-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by a high ground water table. Soil saturation was observed and water-stained leaves were present. There may also be some periods of inundation. It is a closed depression and therefore has no inlet or outlet.

Wetland WMT3 has a forested community consisting of red alder, western redcedar, salmonberry, common ladyfern, western skunk cabbage (*Lysichiton americanus*), and giant horsetail. A single bitter cherry tree, a single western hemlock tree, western swordfern, and salal (*Gaultheria shallon*) are growing on hummocks.

Soil was examined to a depth of 18 inches and consists of two layers. The top layer is an 11-inch very dark gray (10YR 3/1) silt loam. The lower layer is a black (10YR 2/1) silt loam. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WMT3 consists of a mixed forest. Species include bitter cherry, red alder, western redcedar, Douglas fir (on the upper slopes), western hemlock, Himalayan blackberry, Indian plum, salmonberry, cherry laurel (*Prunus laurocerasus*), red elderberry, giant horsetail, and English ivy.

Wetland WMT3 is classified as palustrine forested under the USFWS system and is depressional under the HGM system. Wetland WMT3 is rated a Category III according to the City of Mountlake Terrace (Mountlake Terrace Municipal Code 16.15.080) and Ecology. The wetland scored 41 points on Ecology's rating form (16 points for water quality, 14 points for hydrologic functions, and 11

points for habitat functions) (Attachment D). The City of Mountlake Terrace requires a standard 65-foot buffer for Category III wetlands (Mountlake Terrace Municipal Code 16.15.090).

Wetland WMT4

Size: Approximately 0.43 acre

City of Mountlake Terrace and Ecology Rating: Category III

USFWS Classification: Palustrine Scrub-Shrub

HGM Classification: Depressional

Sample Plots: WMT4-SP1 and WMT4-SP2

Wetland WMT4 is located in a depression west of I-5 and west of the southbound I-5 off-ramp to SR 104. This wetland was not delineated because it is outside of the delineation survey area. It also extends west of the field reconnaissance survey area onto the Nile Shrine Golf Course and is approximately 0.43 acre (see Figure 3-1b). Sample Plot WMT4-SP1 characterizes the wetland and Sample Plot WMT4-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by a high groundwater table and potentially stormwater runoff from I-5. The wetland drains north to McAleer Creek. Observations during the site investigation included flowing water and drainage patterns. The wetland is seasonally inundated and saturated.

Wetland WMT4 contains a scrub-shrub community. Vegetation within the wetland is dominated by salmonberry, common ladyfern, and Himalayan blackberry. Other species present include twinberry honeysuckle, reed canarygrass, western swordfern, giant horsetail, water horsetail (*Equisetum fluviatile*), and false lily of the valley (*Maianthemum dilatatum*).

Soil was examined to a depth of 18 inches and consists of three layers. The top layer is a 5-inch very dark brown (10YR 2/2) loam. The middle layer is an 11-inch very dark greenish gray (10Y 3/1) gravelly sand. The lower layer is a very dark gray (5Y 3/1) and dark greenish gray (10GY 4/1) very sandy loam. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WMT4 consists of narrow areas of forest to the east and west of the wetland. A large retaining wall disrupts the buffer to the east and a golf course is located to the west. The golf course beyond the forested strip to the west is composed of maintained grasses. The forested buffer consists of red alder, western redcedar, salmonberry, Indian plum, Himalayan blackberry, English holly, English ivy, and giant horsetail.

Wetland WMT4 is classified as palustrine scrub-shrub under the USFWS system and depressional under the HGM system. Wetland WMT4 is rated a Category III according to the City of Mountlake Terrace (Mountlake Terrace Municipal Code 16.15.080) and Ecology. The wetland scored 34 points on Ecology's rating form (16 points for water quality, 6 points for hydrologic functions, and 12 points for habitat functions) (Attachment D). The City of Mountlake Terrace requires a standard 65-foot buffer for Category III wetlands (Mountlake Terrace Municipal Code 16.15.090).

Wetland WMT5

Size: Approximately 0.34 acre

City of Mountlake Terrace and Ecology Rating: Category III

USFWS Classification: Palustrine Forested/Palustrine Emergent

HGM Classification: Depressional

Sample Plots: WMT5-SP1, WMT5-SP2, and WMT5-SP3

Wetland WMT5 is located in a shallow depression west of I-5, east of the southbound I-5 off-ramp to 220th Street SW, and north of 220th Street SW (see Figure 3-1c). The wetland is located entirely within the delineation survey area. Sample Plot WMT5-SP1 characterizes the wetland and Sample Plot WMT5-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by a high groundwater table and stormwater runoff. Saturation at the surface was observed along the perimeter of the wetland with pockets of inundation through the center of the wetland. The wetland drains to a catch basin located in the northern portion of the wetland.

Wetland WMT5 contains a forested community and an emergent community. The forested community is dominated by red alder, black cottonwood, quaking aspen (*Populus tremuloides*), twinberry honeysuckle, red-osier dogwood, and Sitka willow, but the emergent community is dominated by reed canarygrass. Other species observed include birch, climbing nightshade, common rush, and fringed willowherb.

At Sample Plot WMT5-SP1, soil was examined to a depth of 18 inches and consists of three layers. The top layer is a 4-inch very dark grayish brown (10YR 3/2) sandy loam. The middle layer is a 3-inch dark greenish gray (10Y 4/1) clay loam. The lower layer is a greenish gray (10Y 5/1) gravelly sandy loam. The middle and lower layers are very compacted.

At Sample Plot WMT5-SP3, soil was examined to a depth of 18 inches and consists of three layers. The top layer is a 6-inch very dark gray (10YR 3/1) gravelly sandy loam. The middle layer is a very dark gray (10YR 3/1) gravelly sandy loam with strong brown (7.5YR 4/6) redoximorphic features. The lowest layer is a very dark gray (2.5Y 3/1) gravelly sandy loam with light olive brown (2.5Y 5/6) redoximorphic features. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WMT5 consists of steep vegetated slopes and maintained road shoulders. The upper slopes, near the roadways, are generally maintained grasses and disturbance-tolerant forbs. The lower portion of the buffer consists of red alder, Douglas fir, black cottonwood, Himalayan blackberry, snowberry (*Symphoricarpos albus*), twinberry honeysuckle, western redcedar, and forsythia (*Forsythia suspensa*).

Wetland WMT5 is classified as palustrine forested/palustrine emergent under the USFWS system, and depressional under the HGM system. Wetland WMT5 is rated a Category III according to the City of Mountlake Terrace (Mountlake Terrace Municipal Code 16.15.080) and Ecology. The wetland scored 30 points on Ecology's rating form (14 points for water quality, 7 points for hydrologic functions, and 9 points for habitat functions) (Attachment D). The City of Mountlake Terrace requires a standard 65-foot buffer for Category III wetlands (Mountlake Terrace Municipal Code 16.15.090).

Wetland WMT6

Size: Approximately 1.12 acres

City of Mountlake Terrace and Ecology Rating: Category III

USFWS Classification: Palustrine Forested

HGM Classification: Depressional

Sample Plots: WMT6-SP1 and WMT6-SP2

Wetland WMT6 is located on a slope and depression northeast of the Mountlake Terrace City Hall. This location is west of I-5, southeast of 60th Avenue West, and west of the southbound I-5 off-ramp to 220th Street SW (see Figure 3-1c). The wetland is located entirely within the delineation survey area. Sample Plot WMT6-SP1 characterizes the wetland and Sample Plot WMT6-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by groundwater. Pockets of saturation and inundation were irregularly located throughout the wetland. The wetland has hummocks and micro-depressions as well as a slope. During the site investigation, the groundwater was expressing in the lower portions of the slope and draining to a catch basin in a ditch northwest of the wetland.

Wetland WMT6 contains a forested community. Vegetation within the wetland includes red alder, Pacific willow, black cottonwood, salmonberry, Himalayan blackberry, red-osier dogwood, giant horsetail, small-fruited bulrush, western skunk cabbage, spreading woodfern (*Dryopteris expansa*), and common ladyfern. Creeping buttercup, watercress, and American speedwell are dominant outside the right-of-way fence along 60th Avenue West.

Soil was examined to a depth of 18 inches and consists of two layers. The top layer is a 7-inch black (10YR 2/1) silt loam with organics. The lower layer is a greenish gray (10G 5/1) gravelly sandy loam. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WMT6 consists of forested areas and maintained lawn. The buffer to the southeast on the I-5 prism slope consists of Douglas fir, big-leaf maple, Himalayan blackberry, Indian plum, and giant horsetail. The buffer near the Mountlake Terrace City Hall and I-5 generally consists of maintained grasses and disturbance-tolerant forbs with some landscaped trees.

Wetland WMT6 is classified as palustrine forested under the USFWS system and depressional under the HGM system. Wetland WMT6 is rated a Category III according to the City of Mountlake Terrace (Mountlake Terrace Municipal Code 16.15.080) and Ecology. The wetland scored 30 points on Ecology's rating form (14 points for water quality, 7 points for hydrologic functions, and 9 points for habitat functions) (Attachment D). The City of Mountlake Terrace requires a standard 65-foot buffer for Category III wetlands (Mountlake Terrace Municipal Code 16.15.090).

Wetland WMT7

Size: Approximately 0.42 acre

City of Mountlake Terrace and Ecology Rating: Category III

USFWS Classification: Palustrine Forested

HGM Classification: Depressional

Sample Plots: WMT7-SP1 and WMT7-SP2

Wetland WMT7 is a relatively flat depression west of the I-5 fill slope, east of 60th Avenue West, and northeast of Wetland WMT6 (see Figure 3-1c). A portion of the wetland was delineated and surveyed in the WSDOT right-of-way, but this work was not completed on the private parcel to the west. The wetland extends outside of the field reconnaissance and delineation survey areas. Sample Plot WMT7-SP1 characterizes the wetland and Sample Plot WMT7-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by a high groundwater table. The predominant hydrologic regime is saturated soils and the outlet of the wetland is located on the west side of the wetland outside of the field reconnaissance and delineation survey areas. The wetland drains into a culvert that flows to the northwest under 60th Avenue West.

Wetland WMT7 contains a forested community. Vegetation within the wetland includes red alder, Sitka willow, Pacific willow, western redcedar, salmonberry, Himalayan blackberry, twinberry honeysuckle, common ladyfern, American skunk cabbage, giant horsetail, and coastal hedgenettle.

Soil was examined to a depth of 26 inches and consists of three layers. The top layer is a 10-inch black (10YR 2/1) organic layer. The middle layer is a 7-inch very dark brown (10YR 2/2) organic layer. The lower layer is a very dark gray (10YR 3/1) silt loam with organic matter inclusions. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer to the north, west, and south of Wetland WMT7 consists of red alder, western redcedar, and salmonberry. There is a narrow forested area on the steep slope of the I-5 road prism to the east that consists of big-leaf maple, European mountain ash (*Sorbus aucuparia*), Douglas fir, Himalayan blackberry, Indian plum, and western swordfern. A narrow band of generally maintained grasses and disturbance-tolerant forbs is located immediately adjacent to I-5.

Wetland WMT7 is classified as palustrine forested under the USFWS system and depressional under the HGM system (Brinson 1993). Wetland WMT7 is rated a Category III according to the City of Mountlake Terrace (Mountlake Terrace Municipal Code 16.15.080) and Ecology. The wetland scored 32 points on Ecology's rating form (14 points for water quality, 7 points for hydrologic functions, and 11 points for habitat functions) (Attachment D). The City of Mountlake Terrace requires a standard 65-foot buffer for Category III wetlands (Mountlake Terrace Municipal Code 16.15.090).

Wetland WMT8

Size: Approximately 0.01 acre

City of Mountlake Terrace and Ecology Rating: Category IV

USFWS Classification: Palustrine Forested

HGM Classification: Slope

Sample Plots: WMT8-SP1 and WMT8-SP2

Wetland WMT8 is located in a swale southeast of I-5, northwest of an apartment complex, and south of 212th Street SW (see Figure 3-1c). Although it is within the field reconnaissance survey area, this wetland was not delineated because it is outside of the delineation survey area. Sample Plot WMT8-SP1 characterizes the wetland and Sample Plot WMT8-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by a high groundwater table. No inlet or outlet was observed in the wetland. Water was flowing slowly from the south to the north during the site investigation. Inundation, saturation, water-stained leaves, and algae were also observed in the wetland. The flowing water likely goes subsurface and drains to a nearby stormwater drainage element.

Wetland WMT8 contains a forested community. Vegetation within the wetland includes salmonberry, common ladyfern, western skunk cabbage, Himalayan blackberry, piggy-back-plant (*Tolmiea menziesii*), giant horsetail, and English ivy. Red alder is growing along the edge, overhanging the wetland.

Soil was examined to a depth of 19 inches and consists of three layers. The top layer is a 5-inch very dark gray (10YR 3/1) loam. The middle layer is a dark gray (5Y 4/1) gravelly sandy loam with olive brown (2.5Y 4/3) redoximorphic features from 5 to 9 inches. The lower layer is a dark greenish gray (10Y 4/1) gravelly sandy loam with dark yellowish brown (10YR 3/4) redoximorphic features. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WMT8 is forested and consists of red alder, Douglas fir, big-leaf maple, European mountain ash, western redcedar, Himalayan blackberry, Indian plum, salmonberry, English ivy, and western swordfern.

Wetland WMT8 is classified as palustrine forested under the USFWS system and depressional under the HGM system. Wetland WMT8 is rated a Category IV according to the City of Mountlake Terrace (Mountlake Terrace Municipal Code 16.15.080) and Ecology. The wetland scored 14 points on Ecology's rating form (4 points for water quality, 3 points for hydrologic functions, and 7 points for habitat functions) (Attachment D). The City of Mountlake Terrace requires a standard 50-foot buffer for Category IV wetlands (Mountlake Terrace Municipal Code 16.15.090).

Wetland WMT9

Size: Approximately 0.03 acre

City of Mountlake Terrace and Ecology Rating: Category IV

USFWS Classification: Palustrine Emergent

HGM Classification: Depressional

Sample Plots: WMT9-SP1 and WMT9-SP2

Wetland WMT9 is a shallow, linear depression (associated with a ditch) located east of the I-5 northbound on-ramp, south of 236th Street SW (see Figure 3-1c). The wetland is located entirely within the delineation survey area. Sample Plot WMT9-SP1 characterizes the wetland and Sample Plot WMT9-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by precipitation, stormwater runoff, and a high groundwater table. There are no inlets to Wetland WMT9. A catch basin is located at the south end of the wetland providing an outlet. Areas of inundation and saturated soils were observed in the wetland.

Wetland WMT9 consists of an emergent vegetation community dominated by maintained grasses interspersed with locally dominant patches of broadleaf cattail, red fescue, common rush, and reed canarygrass.

Soil was examined to a depth of 15 inches and consists of three layers. The top layer is a 2-inch very dark gray (10YR 3/1) silt loam. The middle layer (2 to 9 inches) is a dark gray (2.5Y 5/1) loamy sand with light olive brown (2.5Y 5/6) redoximorphic features. The bottom layer is a compacted dark gray (5Y 5/1) loamy sand with reddish brown (5YR 6/8) redoximorphic features at 9 to 15 inches. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer east and directly adjacent to Wetland WMT9 is a mowed right-of-way dominated by disturbance-tolerant grasses and forbs. A vigorous stand of mixed trees and shrubs, likely planted about 10 years ago, dominate the area farther upslope, east of the wetland. Species consist of big-leaf maple, western serviceberry (*Amelanchier alnifolia*), Douglas fir, and vine maple (*Acer circinatum*). A thin strip of mowed right-of-way separates the wetland from the paved shoulder of the northbound I-5 on-ramp.

Wetland WMT9 is classified as palustrine emergent under the USFWS system and depressional under the HGM system (Brinson 1993). Wetland WMT9 is rated a Category IV according to the City of Mountlake Terrace (Mountlake Terrace Municipal Code 16.15.080) and Ecology. The wetland scored 17 points on Ecology's rating form (6 points for water quality, 4 points for hydrologic functions, and 7 points for habitat functions) (Attachment D). The City of Mountlake Terrace requires a standard 50-foot buffer for Category IV wetlands (Mountlake Terrace Municipal Code 16.15.090).

Wetland WMT10

Size: Approximately 0.03 acre

City of Mountlake Terrace and Ecology Rating: Category IV

USFWS Classification: Palustrine Scrub-Shrub

HGM Classification: Depressional

Sample Plots: WMT10-SP1 and WMT10-SP2

Wetland WMT10 is located east of the I-5 northbound on-ramp, north of SR 104 (see Figure 3-1b). This depressional wetland is near the I-5 right-of-way fence, at the toe of the I-5 fill slope. Sample Plot WMT10-SP1 characterizes the wetland and Sample Plot WMT10-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by a high groundwater table and runoff from the immediate vicinity. The wetland does not contain an inlet or an outlet. Saturated soils and a high water table were observed during the field investigation.

Wetland WMT10 contains a scrub-shrub community dominated by red-osier dogwood, black cottonwood, and Himalayan blackberry. Other common species include rose spirea, giant horsetail, and fringed willowherb. This wetland appears to be maintained periodically.

Soil was examined to a depth of 18 inches and consists of two layers. The top layer is a 5-inch dark grayish brown (10YR 3/2) sandy loam. The lower layer is a dark grayish brown (10YR 3/2) sandy loam and a dark yellowish brown (10YR 3/4) gravelly loamy sand at 5 to 18 inches. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer on the slope to the north, west, and south of Wetland WMT10 consists of a mowed right-of-way dominated by disturbance-tolerant grasses and forbs. Undeveloped (cleared) and developed (commercial building and large parking lot) parcels are located to the east of the wetland, outside the right-of-way fencing.

Wetland WMT10 is classified as palustrine scrub-shrub under the USFWS system and depressional under the HGM system. Wetland WMT10 is rated a Category IV according to the City of Mountlake Terrace and Ecology (Mountlake Terrace Municipal Code 16.15.080). The wetland scored 29 points on Ecology's rating form (12 points for water quality, 8 points for hydrologic functions, and 9 points for habitat functions) (Attachment D). The City of Mountlake Terrace requires a standard 50-foot buffer for Category IV wetlands (Mountlake Terrace Municipal Code 16.15.090).

Wetland WMT11

Size: Approximately 0.07 acre

City of Mountlake Terrace and Ecology Rating: Category III

USFWS Classification: Palustrine Scrub-Shrub

HGM Classification: Depressional

Sample Plots: WMT11-SP1 and WMT11-SP2

Wetland WMT11 is a previously maintained ditch/swale associated with an abandoned school site located east of the I-5 northbound on-ramp, south of 236th Street SW (see Figure 3-1c). The wetland extends outside of the delineation survey area to the east. Sample Plot WMT11-SP1 characterizes the wetland and Sample Plot WMT11-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by precipitation, stormwater runoff, high groundwater table, and occasional ephemeral flooding from Stream SMT1. The inlet to Wetland WMT11 is a partially buried 36-inch corrugated metal pipe that extends under a road to the west of the wetland conveying SMT1. The wetland transitions back to a stream (SMT1) that flows in a southerly direction along the toe of a slope (east of the wetland), eventually discharging into McAleer Creek. Areas of inundation and saturated soils were observed in the wetland.

Wetland WMT11 contains a scrub-shrub community dominated by Himalayan blackberry with locally dominant salmonberry that extends farther east and south, outside the delineation survey area. Emergent vegetation within this community is dominated by reed canarygrass and giant horsetail with a locally dominant patch of common ladyfern (also extending east and south outside the study area). Other species observed include climbing nightshade, creeping buttercup, and a solitary Pacific willow.

Soil was examined to a depth of 18 inches and consists of three layers. The top layer is a 6-inch black (10YR 2/1) sandy clay loam. The middle layer is a very dark grayish brown (10YR 3/2) loamy sand at 6 to 9 inches. At 9 to 18 inches, the bottom layer is a dark grayish brown (10YR 4/2) loamy sand with yellowish brown (10YR 5/8) redoximorphic features. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer northeast of Wetland WMT11 is unmaintained grasses and forbs. The buffer to the southwest is a narrow strip of unmaintained grasses and forbs preceded by paved roadway. A small portion of the wetland is bordered by a stand of mature trees and shrubs along the eastern perimeter, which are part of a larger contiguous vegetated corridor that extends north and south along a steep slope, where the Wetland WMT11 transitions to stream. The trees and shrubs primarily consist of big-leaf maple, black cottonwood, Douglas fir, vine maple, willow species, salmonberry, Himalayan blackberry, and red alder. The remainder of the buffer consists of unvegetated areas, including a road and abandoned building foundations.

Wetland WMT11 is classified as palustrine scrub-shrub under the USFWS system and depressional under the HGM system (Brinson 1993). Wetland WMT11 is rated a Category III according to the City of Mountlake Terrace (Mountlake Terrace Municipal Code 16.15.080) and Ecology. The wetland scored 37 points on Ecology's rating form (22 points for water quality, 4 points for

hydrologic functions, and 11 points for habitat functions) (Attachment D). The City of Mountlake Terrace requires a standard 65-foot buffer for Category III wetlands (Mountlake Terrace Municipal Code 16.15.090).

3.1.4 Lynnwood

Wetland WLY3

Size: Approximately 0.08 acre

City of Lynnwood and Ecology Rating: Category III

USFWS Classification: Palustrine Scrub-Shrub/Palustrine Emergent/Palustrine Unconsolidated Bottom

HGM Classification: Depressional

Sample Plots: WLY3-SP1, WLY3-SP2, WLY3-SP3, and WLY3-SP4

Wetland WLY3 is in a linear depression northwest of I-5 and south of the end of 53rd Avenue West (see Figure 3-1c). The wetland is located entirely within the delineation survey area. Sample Plot WLY3-SP1 characterizes the wetland and Sample Plots WLY3-SP2, WLY3-SP3, and WLY3-SP4 characterize the adjacent upland.

Wetland hydrology is supported by surface water from a culvert under 52nd Avenue and a high groundwater table. Saturation at the surface was observed along the perimeter of the wetland with flowing water through the center of the wetland. A well-defined, ditched channel is present through some of the wetland. The wetland drains to a lifted culvert located near the southwest end of the wetland.

Wetland WLY3 contains a scrub-shrub community dominated by rose spirea with some Himalayan blackberry. This wetland also has an emergent community dominated by reed canarygrass and creeping buttercup. Other species include colonial bentgrass, broadleaf cattail, water parsley, and black cottonwood saplings.

Soil was examined to a depth of 20 inches and consists of two layers. The surface layer is a mixture of a very dark gray (10YR 3/1) silt loam and a gray (2.5Y 5/1) clay loam with light olive brown (2.5Y 5/6) redoximorphic features. The lower layer is a black (10YR 2/1) silt loam. High levels of organic content were observed in the lower layer. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WLY3 consists of steep forested slopes on the I-5 fill slopes to the southeast and disturbed residential properties to the northwest. Vegetation in the I-5 right-of-way consists of Douglas fir, big-leaf maple, black cottonwood, red alder, redwood (*Sequoia* sp.), Himalayan blackberry, English holly, English ivy, Indian plum, and western swordfern. A row of trees including black cottonwood, Douglas fir, and big-leaf maple are growing on the right-of-way fence line northwest of the wetland.

Wetland WLY3 is classified as palustrine scrub-shrub/palustrine emergent/palustrine unconsolidated bottom under the USFWS system and depressional under the HGM system. Wetland WLY3 is rated

a Category III according to the City of Lynnwood (Lynnwood Municipal Code 17.10.050) and Ecology. The wetland scored 36 points on Ecology's rating form (10 points for water quality, 16 points for hydrologic functions, and 10 points for habitat functions) (Attachment D). The City of Lynnwood requires a standard 75-foot buffer for Category III wetlands (Lynnwood Municipal Code 17.10.051).

Wetland WLY4

Size: Approximately 16.54 acres

City of Lynnwood and Ecology Rating: Category II

USFWS Classification: Palustrine Forested/Palustrine Scrub-Shrub/Palustrine Emergent

HGM Classification: Riverine/Depressional

Sample Plots: WLY4-SP1, WLY4-SP2, WLY4-SP3, WLY4-SP4, and WLY4-SP5

Wetland WLY4 is a large wetland/stream complex associated with Scriber Creek, located southeast of Cedar Valley Road, northeast of 204th Street SW, and southwest of the Lynnwood Transit Center (see Figure 3-1c). The wetland extends outside of the field reconnaissance and delineation survey areas. Sample Plots WLY4-SP1, WLY4-SP3, and WLY4-SP5 characterize the wetland and Sample Plots WLY4-SP2 and WLY4-SP4 characterize the adjacent upland.

Wetland hydrology is supported primarily by Scriber Creek, which enters the wetland from the north. A high groundwater table and stormwater runoff likely contribute to the hydrology as well. Saturation of soils, inundation, a permanently flowing stream, and open water ponds were observed in areas of Wetland WLY4. The channel of Scriber Creek is well defined near the northern and southern boundaries, becoming less defined in between. The wetland and Scriber Creek drain southeast, out of the field reconnaissance and delineation survey areas.

Wetland WLY4 contains forested, scrub-shrub, and emergent communities. The forested areas are dominated by black cottonwood, Pacific willow, and reed canarygrass, with lesser amounts of western redcedar, Sitka spruce, and salmonberry. The scrub-shrub community consists primarily of rose spirea, red-osier dogwood, twinberry honeysuckle, and Sitka willow. Indian plum, western skunk cabbage, and water parsley are also present. Reed canarygrass dominates the emergent community. The southern portion of the wetland adjacent to the Interurban Trail is actively maintained.

At Sample Plot WLY4-SP1, soil was examined to a depth of 20 inches and consists of one layer—a black (10YR 2/1) mucky silt. High levels of organic content in various stages of decomposition were observed in the soil. At Sample Plot WLY4-SP3, soil was examined to a depth of 20 inches and consists of three layers. The surface layer is a very dark brown (10YR 2/2) loam with decomposed organic matter. The middle layer is a gray (10YR 5/1) sandy loam with gravels and dark yellowish brown (10YR 3/6) redoximorphic features. The lower layer is a greenish gray (10Y 5/1) sandy loam with gravels and dark yellowish brown (10YR 3/6) redoximorphic features. At Sample Plot WLY4-SP5, soil was examined to a depth of 18 inches and consists of one layer—a black (10YR 2/1) very silty loam. High levels of organic content in various stages of decomposition were observed in the soil. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WLY4 is generally very narrow, often forested or shrub. The wetland is in an urban setting and much of the buffer is a narrow line of trees located between the wetland and developed areas, such as parking lots, trails, or residential and commercial structures. Vegetation includes Douglas fir, western redcedar, red alder, black cottonwood, Himalayan blackberry, red-osier dogwood, English holly, Portugal laurel (*Prunus lusitanica*), western swordfern, English ivy, maintained grasses, and other disturbance-tolerant species. Plantings, a split rail fence, and Native Growth Protection Area (NGPA) signs were observed in the vicinity of the private property to the south along the wetland edge.

Wetland WLY4 is classified as palustrine forested/palustrine scrub-shrub/palustrine emergent under the USFWS system and riverine/depressional under the HGM system. Wetland WLY4 is rated a Category II according to the City of Lynnwood (Lynnwood Municipal Code 17.10.050) and Ecology. The wetland scored 69 points on Ecology's rating form (26 points for water quality, 20 points for hydrologic functions, and 23 points for habitat functions) (Attachment D). The City of Lynnwood requires a standard 110-foot buffer for Category II wetlands (Lynnwood Municipal Code 17.10.051).

Wetland WLY6

Size: Approximately 0.04 acre

City of Lynnwood and Ecology Rating: Category III

USFWS Classification: Palustrine Forested

HGM Classification: Depressional

Sample Plots: WLY6-SP1 and WLY6-SP2

Wetland WLY6 is located in a depression northwest of I-5 and northeast of 208th Street SW (see Figure 3-1c). The wetland is located entirely within the delineation survey area. Sample Plot WLY6-SP1 characterizes the wetland and Sample Plot WLY6-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by stormwater runoff from under 208th Street SW and a high groundwater table. Wetland WLY6 likely has seasonal flooded and seasonal saturated hydroperiods. Wetland hydrology indicators observed include small pockets of inundation and soil saturation. No inlet or outlet was located during the field investigation.

Wetland WLY6 contains a forested community dominated by Pacific willow and twinberry honeysuckle. Other vegetation within the wetland includes red alder, Himalayan blackberry, rose spirea, sedge, common ladyfern, creeping buttercup, and reed canarygrass.

Soil was examined to a depth of 18 inches and consists of three layers. The top layer is a 4-inch very dark gray (10YR 3/1) silt loam with yellowish red (5YR 4/6) redoximorphic features. The middle layer is a 5-inch dark gray (5Y 4/1) clay loam with strong brown (7.5YR 4/6) redoximorphic features. The lower layer is a dark gray (5Y 4/1) clay loam with fewer strong brown (7.5YR 4/6) redoximorphic features. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WLY6 to the west is narrow, consisting of disturbance-tolerant grasses and forbs associated with the maintained right-of-way for 208th Street SW. The buffer to

the north is dominated by black cottonwood and Himalayan blackberry with a few red elderberry and one Douglas fir, extending into a fallow field. The buffer to the south and east contains a gravel access road and is vegetated primarily with Himalayan blackberry and Scotch broom with a few trees and some grasses. Much of the buffer is disturbed by a gravel access road and 208th Street SW.

Wetland WLY6 is classified as palustrine forested under the USFWS system and depressional under the HGM system. Wetland WLY6 is rated a Category III according to the City of Lynnwood (Lynnwood Municipal Code 17.10.050) and Ecology. The wetland scored 40 points on Ecology's rating form (22 points for water quality, 10 points for hydrologic functions, and 8 points for habitat functions) (Attachment D). The City of Lynnwood requires a standard 75-foot buffer for Category III wetlands (Lynnwood Municipal Code 17.10.051).

Wetland WLY7

Size: Approximately 0.04 acre

City of Lynnwood and Ecology Rating: Category III

USFWS Classification: Palustrine Scrub-Shrub

HGM Classification: Depressional

Sample Plots: WLY7-SP1 and WLY7-SP2

Wetland WLY7 is in a small depression northwest of the intersection of 48th Avenue West and the Interurban Trail (see Figure 3-1c). The wetland is located entirely within the delineation survey area. Sample Plot WLY7-SP1 characterizes the wetland and Sample Plot WLY7-SP2 characterizes the adjacent upland. It appears the wetland and entire site on which it is located have been disturbed within the last 10 years.

Wetland hydrology is supported by surface water and precipitation. Saturation was observed at a depth of 9 inches. Water-stained leaves were also observed within the wetland. No inlets or outlets to the wetland were observed.

Wetland WLY7 contains a scrub-shrub community. Vegetation within the wetland is dominated by black cottonwood, Pacific willow, and Sitka willow. Other common species include red alder saplings, Scouler's willow, twinberry honeysuckle, and salmonberry. Herbaceous vegetation under the shrubs was dominated by colonial bentgrass and common velvetgrass (*Holcus lanatus*).

Soil was examined to a depth of 18 inches and consists of three layers. The top layer is an 8-inch grayish brown (10YR 5/1) clay loam. The middle layer is a 5-inch dark grayish brown (10YR 3/2) sandy loam with dark yellowish brown (10YR 4/6) redoximorphic features. The lower layer is a dark reddish brown (10YR 3/3) disturbed sandy loam with dark yellowish brown (10YR 4/6) redoximorphic features. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The buffer surrounding Wetland WLY7 to the northeast is primarily a narrow patch of shrub species preceded by the Edmonds School District property, which is a combination of pavement and areas of bare earth disturbed by heavy machinery. The narrow patch of shrub includes black cottonwood saplings, Himalayan blackberry, Sitka willow, and Scouler's willow. A small portion of the buffer to the west is a narrow shrub-dominated corridor that extends along the Interurban Trail. The

remaining buffer is a thin strip of forbs and grasses followed by the Interurban Trail to the south and 48th Avenue West to the east.

Wetland WLY7 is classified as palustrine scrub-shrub under the USFWS system and depressional under the HGM system. Wetland WLY7 is rated a Category III according to the City of Lynnwood (Lynnwood Municipal Code 17.10.050) and Ecology. The wetland scored 36 points on Ecology's rating form (16 points for water quality, 14 points for hydrologic functions, and 6 points for habitat functions) (Attachment D). The City of Lynnwood requires a standard 75-foot buffer for Category III wetlands (Lynnwood Municipal Code 17.10.051).

Wetland WLY8

Size: Approximately 0.08 acre

City of Lynnwood and Ecology Rating: Category III

USFWS Classification: Palustrine Emergent

HGM Classification: Depressional

Sample Plots: WLY8-SP1 and WLY8-SP2

Wetland WLY8 is in a linear depression northwest of I-5 and southeast of the intersection of 48th Avenue West and the Interurban Trail (see Figure 3-1c). The wetland is located entirely within the delineation survey area. Sample Plot WLY8-SP1 characterizes the wetland and Sample Plot WLY8-SP2 characterizes the adjacent upland.

Wetland hydrology is supported by surface water from a culvert under 48th Avenue West. Surface soil cracks and bare ground were observed in some areas of the wetland, and a well-defined, ditched channel is present in a part of the wetland. There is no outlet in the wetland.

Wetland WLY8 contains an emergent community. Vegetation within the wetland is dominated by common rush and various grasses with locally dominant patches of common spikerush (*Eleocharis palustris*). Reed canarygrass and broadleaf cattail are also present.

Soil was examined to a depth of 12 inches and consists of two layers. The top layer is a 4-inch dark grayish brown (10YR 4/2) gravelly silt loam. The bottom layer is a grayish brown (2.5Y 5/2) gravelly clay loam. Both layers contain dark yellowish brown (10YR 4/6) redoximorphic features. The soil was very compacted and gravel, cobble, and angular rock were observed throughout the soil profile. Soils in the wetland are not mapped by the NRCS (identified as Urban land).

The majority of the buffer surrounding WLY8 is disturbed and consists largely of invasive vegetation including Scotch broom and Himalayan blackberry. The remaining buffer is a thin strip of forbs and grasses preceded by 48th Avenue West and the Interurban Trail.

Wetland WLY8 is classified as palustrine emergent under the USFWS system and depressional under the HGM system. Wetland WLY8 is rated a Category III according to the City of Lynnwood (Lynnwood Municipal Code 17.10.050) and Ecology. The wetland scored 38 points on Ecology's rating form (22 points for water quality, 10 points for hydrologic functions, and 6 points for habitat functions) (Attachment D). The City of Lynnwood requires a standard 75-foot buffer for Category III wetlands (Lynnwood Municipal Code 17.10.051).

3.2 Streams

The study area for the Lynnwood Link Extension is drained by three stream systems: Thornton Creek, McAleer Creek, and Scriber Creek (see Figures 3-1a, 3-1b, and 3-1c; Attachment F). All three streams drain to Lake Washington. Thornton and McAleer creeks drain directly to the lake, while water from Scriber Creek flows to the lake via Swamp Creek and the Sammamish Slough. Lake Washington is the second-largest natural lake in Washington, with a surface area of 22,138 acres. The lake lies at an elevation of 22 feet and has a maximum depth of 214 feet. The major sources of water that enter the lake are the Cedar River (55 percent of the average inflow) and the Sammamish River (27 percent of the average inflow). The remainder of inflow comes from May Creek, Coal Creek, Lyon Creek, McAleer Creek, Thornton Creek, and other smaller streams. The lake drains to Puget Sound through the Lake Washington Ship Canal, which is an artificial waterway constructed in 1916.

Table 3-3 summarizes the stream information in the study area. The existing conditions of streams are described below, organized by stream system. Additional information about fish use, fish habitat quality, and riparian habitat conditions in the streams and their tributaries is provided in the Ecosystem Resources Technical Report (Sound Transit 2014).

Table 3-3. Summary of Streams in the Lynnwood Link Extension Study Area

Stream Name[a]	Stream Index No.[b]	Fish Habitat Status[c]	Local Jurisdiction	Local Jurisdiction Stream Classification[d]	Local Jurisdiction Buffer Width (feet)
Thornton Creek, North Branch	08.0030	Documented	Seattle	Type 3[e]	75[e]
Thornton Creek Tributary (SSE1)	NA	Potential	Seattle	Type 3[e]	75[e]
McAleer Creek Tributary (SSH2)	NA	Unknown (Presumed Potential)	Shoreline	Piped	10
McAleer Creek Tributary (SSH4)	NA	Unknown	Shoreline	Type III	65
McAleer Creek	08.0049	Documented	Shoreline	Type II	115
McAleer Creek	08.0049	Documented	Mountlake Terrace	Class II	100
McAleer Creek Tributary (SMT1)	08.0050	Potential	Mountlake Terrace	Class III/Class V[f]	65/0[f]
Scriber Creek	08.0061	Documented	Lynnwood	Category I	100
Scriber Creek Tributary (SLY1)	08.0064	Potential	Lynnwood	Category III	35

Streams other than Thornton Creek, McAleer Creek, and Scriber Creek are identified with alphanumeric codes: SYYn.
S stands for stream; YY = two-letter code for local jurisdiction (SE = Seattle, SH = Shoreline, MT = Mountlake Terrace, LY = Lynnwood); n = sequential identification number

[b] Water Resource Inventory Area (WRIA) identification numbers according to Williams et al. (1975). 'NA' indicates watercourses that are not identified in that inventory.

[c] Documented = Fish have been observed in the study area; Potential = Potential fish habitat is present, based on field assessment of stream width and gradient, but stream segments in the study area are upstream of human-caused fish passage barriers; Unknown = No fish presence data are available and stream segments are contained within culverts in the study area.

[d] Identification and classification of streams in this analysis represent conservative estimates, based on available information and the provisions of local critical areas rules. Some of the watercourses identified in this analysis may not actually be defined as streams by the local jurisdictions, or they may be assigned smaller buffers than indicated here. Actual impacts would be analyzed and mitigated as appropriate through local permitting processes.

[e] The Seattle Municipal Code applies development restrictions and specifies mitigation requirements only within environmentally critical areas or buffers on publicly or privately held parcels. The locations where the proposed alignments would pass near Thornton Creek and Stream SSE1 are within the right-of-way for I-5 and are therefore not subject to City of Seattle buffer requirements. Regulatory buffer widths are used in this analysis to identify areas where construction of the light rail alternatives could affect the condition of riparian buffers. Mitigation requirements would be developed through local permitting processes.

[f] See Stream SMT1 discussion under Section 3.2.2.

3.2.1 Thornton Creek and Tributaries

The 7,200-acre Thornton Creek basin drains a substantial portion of northeastern Seattle and most of Shoreline. The stream flows generally south and east before discharging to Lake Washington. Segments of the North Branch of Thornton Creek (Water Resource Inventory Area [WRIA] No. 08.0030) within and immediately upstream of the Jackson Park Golf Course fall within the study area. Also present is an unnamed tributary to the North Branch of Thornton Creek, identified as Stream SSE1 for this analysis.

Thornton Creek, North Branch

The North Branch of Thornton Creek originates near Ronald Bog in Shoreline and enters the study area south of North 145th Street and west of 5th Avenue NE, after emerging from culverts under I-5. Within the study area, the stream flows in a ditch between 5th Avenue NE and the Jackson Park Golf Course for approximately 700 feet before veering east into the golf course (Tetra Tech/KCM 2004a).

All portions of the North Branch of Thornton Creek in the study area are considered fish-bearing (WDFW 2014a). In-stream habitat within the study area is rated as low, based on channel morphology, sediment regime, and existing physical habitat conditions (City of Seattle 2007). Resident salmonids are present throughout the system. Spawning anadromous salmonids have been observed as far upstream as 35th Avenue NE and NE 115th Street, approximately 2.5 miles downstream of the study area (City of Seattle 2007; WDFW 2014a). WDFW (2014b) classified three of the culverts in the North Branch of Thornton Creek downstream of the study area as total barriers to fish passage. An additional 18 structures, including 7 culverts, 5 streambed control structures, 3 recreational dams, 2 bridges, and 1 artificial waterfall, are partial barriers (WDFW 2014b). Within the study area, the culverts under I-5 and 5th Avenue NE are also partial barriers (WDFW 2014b). However, an adult steelhead observed in 2004 upstream of the I-5 culvert suggests that none of these structures may present an absolute barrier to fish passage (Tetra Tech/KCM 2004a). Notably, steelhead are renowned for their ability to negotiate what would be considered barriers for most other salmonids (Tetra Tech/KCM 2004a).

Riparian habitat quality of the North Branch of Thornton Creek within the study area is rated low, based on riparian area width, connectivity, understory and canopy composition, canopy density, and the percentage of the stream shaded by vegetation (City of Seattle 2007). Much of the stream's riparian buffer in the study area consists of roads (5th Avenue NE and off-ramps from I-5) and other impervious surfaces. Stream banks in most portions of the study area are dominated by Himalayan blackberry, particularly along the segment that parallels 5th Avenue NE. On the opposite side of 5th Avenue NE from the light rail alignments, the stream passes through a 50- to 70-foot-wide strip of vegetation. Overstory species in this strip include red alder, black cottonwood, and scattered patches of immature western redcedar. This overstory canopy provides shade for the stream during spring and summer (when the trees have leaves), as well as the potential for contributing some woody debris. Within the golf course, the dominant riparian vegetation in the study area consists of non-native plants, turf, and landscaping.

The North Branch of Thornton Creek in the study area is located within the city of Seattle and is therefore subject to the provisions of the local Critical Areas Ordinance (Seattle Municipal Code 25.09). Notably, the ordinance applies development restrictions and specifies mitigation requirements only within environmentally critical areas or buffers on publicly or privately held parcels. The locations where the proposed alternative alignments would pass near the stream are within the right-of-way for I-5 and therefore are not subject to City of Seattle buffer requirements. However, to facilitate a comparison of the potential effects of the alternatives, the stream has been assigned an analytical buffer based on a provisional classification. Based on the presence of natural waters with moderate to slight value to fish for spawning, rearing, or migration (i.e., having a defined channel width of at least 2 feet and a gradient less than 16 percent), the North Branch of Thornton Creek in the study area would be classified as a Type 3 stream, requiring a riparian buffer of 75 feet.

Stream SSE1

Approximately 300 feet south of Thornton Creek's crossing under 5th Avenue NE, a watercourse emerges from a culvert in the I-5 right-of-way, flows southward in the ditch on the west side of 5th Avenue NE, and then drains to Thornton Creek via a culvert under 5th Avenue NE. The watercourse was not catalogued by Williams et al. (1975); the source of the water in the ditch is not known and historic maps of the area do not indicate the presence of a tributary to Thornton Creek at this location. However, field observations of flowing water during the summer months suggest that some flow may be derived from groundwater. No fish are known or expected to use the watercourse (WDFW 2014a). Riparian habitat for the surface-flowing segment of the watercourse consists of a strip of red alder and Himalayan blackberry in the I-5 right-of-way between 5th Avenue NE and the off-ramp from I-5 northbound to NE 145th Street.

The watercourse falls within the Seattle city limits and is therefore subject to the provisions of Seattle Municipal Code 25.09. For this analysis, this watercourse is provisionally identified as a stream (SSE1) and classified as Type 3, based on the presence of a 2-foot-wide channel and a gradient less than 16 percent. As with the North Branch of Thornton Creek, the surface-flowing portion of the stream in the study area is within a road right-of-way and therefore is not subject to City of Seattle buffer requirements. A formal determination of whether the watercourse is a stream (and if so, how it is classified) will occur through the process of project permitting with the City of Seattle.

3.2.2 McAleer Creek and Tributaries

McAleer Creek (WRIA No. 08.0049) originates at Lake Ballinger and flows roughly 6 miles to the northeast corner of Lake Washington. The 5,300-acre drainage basin includes portions of Lynnwood, Edmonds, Mountlake Terrace, Shoreline, and Lake Forest Park. Most of the northern portion of the study area (from NE 185th Street in Shoreline, north to about 208th Street SW in Lynnwood) drains to the McAleer Creek system. Areas north of 224th Street SW drain to Lake Ballinger, which empties to McAleer Creek.

McAleer Creek

Much of McAleer Creek within the study area is contained within culverts. The main stem enters the study area from an open channel through the Nile Shrine Golf Course west of I-5. The open-channel habitat and associated riparian areas of McAleer Creek in the study area occur in four discrete segments, separated by segments that are contained within culverts. The stream segments in the study area are as follows, progressing from upstream to downstream:

- Culvert under I-5 (440 feet)
- Open channel adjacent to the on-ramp from SR 104 westbound to I-5 northbound (240 feet)
- Culvert under the cloverleaf interchange between I-5 northbound and SR 104 westbound (280 feet)
- Open channel in the area enclosed by the cloverleaf off-ramp from I-5 northbound to SR 104 westbound (200 feet)
- 4-foot by 6-foot box culvert under SR 104 (320 feet)
- Channelized open water course in the area enclosed by the cloverleaf on-ramp from SR 104 eastbound to I-5 northbound (200 feet)
- 66-inch-diameter culvert beneath the off-ramp from I-5 northbound to SR 104 (280 feet)

All portions of McAleer Creek in the study area are considered fish-bearing, supporting both anadromous and resident salmonids (WDFW 2014a). Immediately downstream of the study area, the in-stream habitat of McAleer Creek has been rated as poor, based on the preponderance of fine sediments, as well as scouring and incision resulting from bank hardening (Tetra Tech/KCM 2004b). The channel provides poorly defined pool-riffle complexes; the only pool habitat consists of step-pools formed by weirs. The gravel/cobble stream substrate is heavily cemented with sediment, reducing its spawning suitability (Tetra Tech/KCM 2004b). Riparian habitat quality along the open-channel segments of McAleer Creek in the study area is generally good, dominated by forest canopy that provides shade and the potential for recruitment of woody debris that contributes to channel complexity. The value of the riparian habitat is limited, however, by a lack of connectivity.

McAleer Creek within the study area is located within two jurisdictions and is therefore subject to two separate Critical Area Ordinances. Stream segments south of NE 205th Street and SR 104 are within the city of Shoreline and are subject to the provisions of Shoreline Municipal Code chapter 20.80. Stream segments north of NE 205th Street and SR 104 are within the city of Mountlake Terrace and are subject to the provisions of Mountlake Terrace Municipal Code chapter 16.15. Shoreline Municipal Code 20.80.470 classifies McAleer Creek as Type III, which requires a 75-foot buffer. Mountlake Terrace Municipal Code 16.15.080 classifies McAleer Creek as Class II, which requires a 100-foot buffer.

Stream SSH2

Approximately 1,800 feet south of the I-5/SR 104 interchange, a tributary to McAleer Creek (Stream SSH2) has been identified as passing under I-5 (Tetra Tech/KCM 2004b). This tributary was not catalogued by Williams et al. (1975). After entering a culvert just west of I-5, the stream remains piped for approximately 1,500 feet, resurfacing shortly before its confluence with the main stem of McAleer Creek near a wastewater pumping station upstream of 15th Avenue NE (Tetra Tech/KCM 2004b). The open-water portions of the stream within the study area, west of I-5 (i.e., on the opposite side of I-5 from any of the proposed alternative alignments), are within concrete-lined ditches along NE 200th Street. During site visits conducted for this analysis, flowing water was observed in this watercourse only during and immediately after rainfall.

Based on intermittent flows and the presence of human-created barriers to fish passage, SSH2 is not known or expected to support fish under current conditions (WDFW 2014a). However, the basin size, channel width, and stream gradient of the watercourse indicate the potential to support fish in the future. Shoreline Municipal Code 20.80.470 classifies the stream as Piped, which requires a 10-foot buffer.

Stream SSH4

Within the cloverleaf interchange between eastbound SR 104 and northbound I-5, a watercourse emerges from a culvert under the roadway, flows approximately 30 feet, and then joins McAleer Creek. The watercourse was not catalogued as a stream by Williams et al. (1975), the source of the water is not known, and historical maps of the area do not indicate the presence of a tributary to McAleer Creek at this location. However, field observations of flowing water during the summer months suggest that some flow may be derived from groundwater. The surface-flowing segment of the stream in the study area can be accessed by fish from McAleer Creek.

For this analysis, this watercourse is provisionally identified as a stream (SSH4) and classified as Type III per Shoreline Municipal Code 20.80.470, based on the presence of a 2-foot-wide channel and a gradient less than 16 percent. A formal determination of whether the watercourse is a stream (and if so, how it is classified) will occur through the process of project permitting with the City of Shoreline. If the watercourse is classified as a Type III stream, its regulatory buffer will be contained entirely within the larger regulatory buffer for McAleer Creek. Riparian habitat conditions for Stream SSH4 are therefore the same as described for McAleer Creek above.

Stream SMT1

North of the I-5/SR 104 interchange, a tributary (WRIA No. 08.0050; Stream SMT1) joins McAleer Creek in the wooded area adjacent to the on-ramp from SR 104 westbound to I-5 northbound. The tributary originates in Veterans Memorial Park northeast of the Mountlake Terrace Transit Center, then flows south through a series of open watercourses and culverts east of I-5. During site visits conducted for this analysis, flowing water was observed in this watercourse only during and immediately after rainfall. Farther downstream, along the eastern border of the Edmonds School District property south of 236th Street SW, water from a culvert under the school property

contributes flow on a more regular basis. Based on intermittent flows and the presence of human-created barriers to fish passage, SMT1 is not known or expected to support fish under current conditions (WDFW 2014a). However, the basin size, channel width, and stream gradient of the watercourse indicate the potential to support fish in the future. Riparian habitat quality along the open-channel segments of Stream SMT1 in the study area is generally good, dominated by forest canopy that provides shade and the potential for recruitment of woody debris that contributes to channel complexity. The value of the riparian habitat is limited, however, by culverts that interfere with the passage of woody debris to downstream segments of fish-bearing streams.

The City of Mountlake Terrace has identified the uppermost reaches of this watercourse in the study area as a Class V (seasonal, non-fish-bearing) stream that does not require a regulatory buffer. It is possible that the City may determine that the downstream reaches meet the criteria for a Class IV (requiring a 50-foot buffer) or Class III stream (requiring a 65-foot buffer). The segment that is crossed by the proposed light rail alignments is upstream of the water source in the Edmonds School District property and is therefore likely to be considered a Class V stream.

3.2.3 Scriber Creek and Tributaries

Scriber Creek (WRIA No. 08.0061) drains an area of approximately 4,250 acres, including the extreme northern portion of the study area. The stream flows southeast, joining Swamp Creek approximately 2.5 miles downstream of the study area. Swamp Creek flows into the Sammamish River, which empties into the northern end of Lake Washington.

Scriber Creek

The study area includes approximately 2,000 feet of the main stem of Scriber Creek. For much of its length in the study area, the stream channel is braided and indistinct as it flows through the large wetland complex (Wetland WLY4) south and west of the Lynnwood Transit Center. The stream forms a defined channel as it exits the study area, flowing southeast and under I-5. Based on input provided by Ecology staff who collaborated on field delineations in July 2014, the OHWM of Scriber Creek through the wetland complex is defined as encompassing the entire breadth of the complex. At most times of year, flowing water is confined to a few channels that make up a small portion of the total wetland complex. The locations of these channels likely change from year to year.

All portions of Scriber Creek in the study area are considered fish-bearing, supporting resident salmonids (WDFW 2014a). Anadromous salmonids have been observed in Scriber Creek, but sources differ about their habitat use as far upstream as the study area (Sound Transit 2014). The main stem reach in the study area is dominated by the large scrub-shrub wetland adjacent to the park-and-ride lot. Salmon spawning habitat conditions within this reach are poor due to limited canopy and vegetative cover, the presence of bank armoring, and the abundance of silt and other fine substrates (Jones and Stokes 2000). Side channels and other low-velocity areas may provide good rearing habitat, however (City of Lynnwood 2004). Riparian vegetation for Scriber Creek in the study area generally consists of the surrounding wetland complex (Wetland WLY4). Vegetation in Wetland WLY4 is dominated by black cottonwood, Pacific willow, red-osier dogwood, and reed canarygrass.

Areas with dense growth of salmonberry and Himalayan blackberry are also present, along with red alder, western redcedar, big-leaf maple, and Pacific flowering dogwood (*Cornus nuttallii*).

Scriber Creek within the study area is located within the city of Lynnwood and therefore subject to the local Critical Areas Ordinance. Lynnwood Municipal Code 17.10.060 classifies Scriber Creek as a Category I, which requires a 100-foot buffer.

Stream SLY1

Also present in the study area is an unnamed, intermittent, non-fish-bearing tributary (WRIA No. 08.0064; Stream SLY1) that flows southward along the eastern edge of the Lynnwood Transit Center. The channel flows through a small patch of forest vegetation (the upper part has been recently planted) before it enters a culvert under the I-5 on-ramp and joins Scriber Creek southeast of I-5. The watercourse is highly channelized and does not flow at the surface for most of its length. The surface-flowing sections are the short segments within and downstream of the study area, including a segment on the Lynnwood Civic Center campus approximately 0.6 mile north of the study area. The primary source of flow for the tributary is urban runoff, and habitat quality is generally poor. Stormwater runoff from impervious surfaces likely contributes to a flashy flow regime during fall and winter (City of Lynnwood 2004). A flashy flow regime is one in which water volumes peak sharply after the onset of a precipitation event, rapidly returning to pre-rain levels shortly after the precipitation ends.

The portion of Stream SLY1 in the study area is separated from known fish-bearing waters by culverts under the off-ramp from I-5 northbound to 44th Avenue West, I-5 itself, and the on-ramp from 44th Avenue West to I-5 southbound. WDFW (2014b) has not evaluated the fish passage potential of these culverts because Stream SLY1 is considered a non-fish-bearing stream. Based on the presence of human-created barriers to fish passage, Stream SLY1 is not currently known or expected to support fish. Based on its basin size, channel width, and stream gradient, however, Stream SLY1 may have the potential to support fish in the future.

Lynnwood Municipal Code 17.10.060 classifies Stream SLY1 as Category III, which requires a 35-foot buffer.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) **(except MLRA 1, 2, 4A, and 4B)**
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stresses Plants (D1) **(LRR A)**
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) **(MLRA 1, 2, 4A, and 4B)**
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) **(LRR A)**
- ☐ Frost-Heave Hummocks (D7)

Field Observations:

Surface Water Present? Yes ☐ No ☒ Depth (inches):

Water Table Present? Yes ☐ No ☒ Depth (inches):

Saturation Present? (includes capillary fringe) Yes ☐ No ☒ Depth (inches):

Wetland Hydrology Present? **Yes** ☐ **No** ☒

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: No primary or secondary wetland hydrology indiators were observed.
04/22/14 - No indicators of wetland hydrology observed.

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project Site: Lynnwood Link Extension | City/County: Seattle/King | Sampling Date: 3/14/12 & 7/2/13

Applicant/Owner: Sound Transit | State: WA | Sampling Point: WSE3-SP1

Investigator(s): M. Maynard, C. Worsley | Section, Township, Range: S20, T26N, 4E

Landform (hillslope, terrace, etc.): _____ | Local relief (concave, convex, none): concave | Slope (%): 1

Subregion (LRR): A | Lat: 47.72883384730 | Long: -122.32369209500 | Datum: NAD83

Soil Map Unit Name: Urban land | NWI classification: PEM

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☐ No ☐ (If no, explain in Remarks.)

Are Vegetation ☐, Soil ☐, or Hydrology ☐, significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐

Are Vegetation ☐, Soil ☐, or Hydrology ☐, naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ☒	No ☐	**Is the Sampled Area within a Wetland?**	**Yes ☒ No ☐**
Hydric Soil Present?	Yes ☒	No ☐		
Wetland Hydrology Present?	Yes ☒	No ☐		

Remarks: WSE3-SP1 is located in a reed canarygrass patch at the north end of the wetland, approximately 5 feet west of the fence and 15 feet west of the power pole.

VEGETATION – Use scientific names of plants

Tree Stratum (Plot size: 10M)	Absolute % Cover	Dominant Species?	Indicator Status

Hydric Soils Present? **Yes** ☒ **No** ☐

Remarks: Inclusions of 10YR 2/1 sandy loam from 15 inches and below.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☒ High Water Table (A2)
- ☒ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) **(except MLRA 1, 2, 4A, and 4B)**
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stresses Plants (D1) **(LRR A)**
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) **(MLRA 1, 2, 4A, and 4B)**
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) **(LRR A)**
- ☐ Frost-Heave Hummocks (D7)

Field Observations:

Surface Water Present?	Yes	☐	No	☒	Depth (inches):	
Water Table Present?	Yes	☒	No	☐	Depth (inches):	7
Saturation Present? (includes capillary fringe)	Yes	☒	No	☐	Depth (inches):	surface

Wetland Hydrology Present? **Yes** ☒ **No** ☐

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: Sample plot is adjacent to standing water (1 inch deep). Soils were saturated to 4 inches below the surface during 7/16/13 site investigation.

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project Site: Lynnwood Link Extension City/County: Shoreline/King Sampling Date: 3/15/12
Applicant/Owner: Sound Transit State: WA Sampling Point: WSH1-SP2
Investigator(s): M. Maynard, C. Worsley Section, Township, Range: S17, T26N, R4E
Landform (hillslope, terrace, etc.): _____ Local relief (concave, convex, none): convex Slope (%): 4
Subregion (LRR): A Lat: 47.73441940360 Long: -122.32406798700 Datum: NAD83
Soil Map Unit Name: Urban Land NWI classification: Upland
Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☐ No ☒ (If no, explain in Remarks.)
Are Vegetation ☐, Soil ☐, or Hydrology ☐, significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
Are Vegetation ☐, Soil ☐, or Hydrology ☐, naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ☒	No ☐	**Is the Sampled Area within a Wetland?**	**Yes ☐ No ☒**
Hydric Soil Present?	Yes ☐	No ☒		
Wetland Hydrology Present?	Yes ☒	No ☐		

Remarks: The sample plot is located northwest of the wetland (between north and west arms) on a grass slope, between north and west arms. Heavy rains during site investigation and more than average precipitation for the five days prior.

VEGETATION – Use scientific names of plants

% Bare Ground in Herb Stratum ____

Dominance Test Worksheet:

Number of Dominant Species That Are OBL, FACW, or FAC:	2	(A)
Total Number of Dominant Species Across All Strata:	4	(B)
Percent of Dominant Species That Are OBL, FACW, or FAC:	50	(A/B)

Prevalence Index worksheet:

Total % Cover of:		Multiply by:	
OBL species		x1 =	
FACW species	90	x2 =	180
FAC species	40	x3 =	120
FACU species	80	x4 =	320
UPL species	5	x5 =	25
Column Totals:	215 (A)		645 (B)

Prevalence Index = B/A = 3.0

Hydrophytic Vegetation Indicators:

- ☐ 1 – Rapid Test for Hydrophytic Vegetation
- ☐ 2 - Dominance Test is >50%
- ☒ 3 - Prevalence Index is ≤3.0[1]
- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? **Yes ☒ No ☐**

Remarks: Species with 5% or less absolute coverage were not considered dominant. The 2013 Region 9 National Wetland Plant List and 2010 Supplement were used for this delineation.

Project Site: Lynnwood Link Extension

SOIL

Sampling Point: WMT2-SP1

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth	Matrix		Redox Features					
(inches)	Color (moist)	%	Color (moist)	%	Type[1]	Loc[2]	Texture	Remarks
0-6	10YR 3/2	100					Sa loam	
6-12	2.5Y 4/2		10YR 5/6		C	M	Gr Sa Loam	
12+								Extremely compacted soil

[1]Type: C= Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1) **(except MLRA 1)**
- ☐ Loamy Gleyed Matrix (F2)
- ☒ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)

Indicators for Problematic Hydric Soils[3]:

- ☐ 2 cm Muck (A10)
- ☐ Red Parent Material (TF2)
- ☐ Very Shallow Dark Surface (TF12)
- ☐ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: Very compacted soils

Depth (inches): at 12 inches below the surface

Hydric Soils Present? **Yes** ☒ **No** ☐

Remarks: Restrictive layer/extremely compated at 12 inches.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☒ High Water Table (A2)
- ☒ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) **(except MLRA 1, 2, 4A, and 4B)**
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stresses Plants (D1) **(LRR A)**
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) **(MLRA 1, 2, 4A, and 4B)**
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) **(LRR A)**
- ☐ Frost-Heave Hummocks (D7)

Field Observations:

Surface Water Present?	Yes	☐	No	☒	Depth (inches):	
Water Table Present?	Yes	☒	No	☐	Depth (inches):	10
Saturation Present? (includes capillary fringe)	Yes	☒	No	☐	Depth (inches):	0-12

Wetland Hydrology Present? **Yes** ☒ **No** ☐

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: Soils were saturated from the surface to 12 inches below the surface (water was seeping in from the upgradient side of the sample plot). Water seeping in from upgradient side. .

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project Site: Lynnwood Link Extension | City/County: ML Terrace/Snohomish | Sampling Date: 3/27/12 & 8/7/13

Applicant/Owner: Sound Transit | State: WA | Sampling Point: WMT2-SP2

Investigator(s): M. Maynard, C. Worsley | Section, Township, Range: S32, T27N, R4E

Landform (hillslope, terrace, etc.): flat bench | Local relief (concave, convex, none): none | Slope (%): 0

Subregion (LRR): A | Lat: 47.77955318300 | Long: -122.31597964400 | Datum: NAD83

Soil Map Unit Name: Urban Land | NWI classification: Upland

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☐ No ☐ (If no, explain in Remarks.)

Are Vegetation ☐, Soil ☐, or Hydrology ☐, significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐

Are Vegetation ☐, Soil ☐, or Hydrology ☐, naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ☐	No ☒	**Is the Sampled Area within a Wetland?**	**Yes ☐ No ☒**
Hydric Soil Present?	Yes ☐	No ☒		
Wetland Hydrology Present?	Yes ☐	No ☒		

Remarks: **The sample plot is located east of the wetland on a flat bench, approximately 5 feet southwest of the right-of-way fence, approximately 20 feet (60 degrees) northeast of flag WMT2-10.**

VEGETATION – Use scientific names of plants

Tree Stratum (Plot size: 10M)	Absolute % Cover	Dominant Species?	Indicator Status
